Enough had been done when MAZOIS published his researches in "Les Ruines de Pompeii" to excite the wonder and admiration of his contemporaries, and when Sir WILLIAM GELL's beautiful work "Pompeiana" and DONALDSON'S "Pompeii" appeared, between 1824 and 1830, the marvels at the foot of Vesuvius were made better known to the British public, and the circle of students of the Pompeian ruins was greatly widened. DYER'S work of 1867 again enlarged this circle, while LYTTON'S "Last Days of Pompeii" attracted to the buried city the attention of a still larger class, and photography has made the general features of Pompeii familiar to all.

Since Signor FIORELLI was appointed director of the excavations many valuable additions have been made to our knowledge. Some of these were published and illustrated in ROLFE and FISCHETTI'S elegant volume of 1884, and FIORELLI'S "Giornale degli Scavi di Pompeii" has from time to time made known other discoveries.

The latest contribution to our knowledge of Pompeii is Mr. FITZGERALD MARRIOTT'S work, "Facts about Pompeii," which not only describes recent discoveries, but gives much valuable information respecting previously uncovered ruins not dwelt upon by other writers, by which a much more vivid picture of the Pompeii of old is given to the mind than was before obtainable by English readers.

The evidence of the storeyed character and of the height of the original houses of the city furnished by the ruins of the houses on the southern cliff, and by pictures which have been preserved, quite remove the impression given by the general absence of a second storey to the houses at the present time. One of the cliff houses shows three floors built against the side of the cliff. The lowest shows a terrace that roofs over the bathrooms; behind are large rooms, and also two small rooms one above the other, thus occupying the same height as the larger rooms; above are the walls of the floor on a level with the general ground-floor

level of the city. The houses behind the Curia Isiaca show two storeys distinctly by their height and the marks for the beams.

Contrary to the general impression, too, of low rooms, it is shown that the height of the rooms opening on the atrium of the Casa dei Diadumeni must have been about 15 or 16 feet. A very interesting picture in the Casa del Centenario represents a country or farmhouse, with two if not three storeys, and a perfect fresco has been preserved in a small house near the Casa del Balcone, showing a house with two floors and a room on the roof.

The towers on the walls have hitherto received very scant notice, but they are here described and illustrated.

To Professor MAU we are indebted for the discovery of the four styles of mural decoration corresponding to the four periods of the history of the city. These are (1) the Oscan or pre-Roman, (2) the Republican, (3) the early Imperial to A.D. 50, and (4) the period from A.D. 50 to the destruction of the city in A.D. 79. A valuable portion of Mr. MARRIOTT'S work is devoted to this subject, in which the author gives the examples of each style and period which have been preserved.

The chapter entitled "Notes on Some of the Most lately Excavated Houses" is full of interest, since, besides the cliff houses, it includes notices of the Casa del Centenario and that of the Monte d'Argento.

The five years' labour which the author has given to Pompeii has enabled him to make an important addition to our knowledge of details, by a very complete representation of the curious masons' marks on the stones of the uncovered houses and other buildings. Over 300 of these ancient inscribed marks are accurately reproduced, with precise indications of where they may be found. The author is certainly to be congratulated upon having produced not only a highly interesting and beautifully-printed and illustrated volume, but a most valuable contribution to that complete elucidation of the remains of the ancient Campanian city which all historians, antiquaries and architects so much desire.

PRICED QUANTITIES.

IN October of last year a sub-committee of the Manchester Society of Architects was appointed to consider the question of depositing priced quantities with architects by builders. Queries relating to the subject were addressed to the architectural societies. On receipt of their answers an application was made to the Building Trades Association, asking "whether, in the event of the Society undertaking to recommend their members to subdivide the contracts into the different trades, the members of the Association would be prepared to deposit their priced quantities with the architects?" After considering the subject the following resolution was adopted by the Building Trades Association:—"That in reply to the letter of the Society of Architects the question be asked whether the architects will agree to the quantities being taken and the accounts squared up at the completion of the building by an independent surveyor, and that the quantities form part of the contract." The reply of the Society was as follows:—"That this committee is not prepared (in its report to the general meeting of the members of the Manchester Society of Architects and other independent architects) to recommend any interference with the individual practice of architects in respect to taking out of quantities. It is, however, prepared to advise making the quantities a part of the contract." The Council of the Building Trades Association thereupon stated that they had nothing to add to their resolution. It would appear, however, that earlier in the year a similar inquiry was submitted to the Master Builders' Association, for on May 4, 1894, that body passed the subjoined resolution:—

"That the priced quantities shall not be given to the architects unless they are made part of the contract, but that, if so requested, they shall be produced at the final squaring up of the building, for the purpose of settling the accounts."

It appears the phrase "unless they are made part of the contract" did not form part of the resolution, the correct phraseology being "that the priced quantities shall not be given to the architects, but that, if so requested, they shall be produced at the final squaring up of the buildings, for the purpose of settling the accounts."

On the 19th ult. a special meeting of the Manchester Society of Architects was held, when it was unanimously resolved:—

That this special general meeting of the Manchester Society of Architects (and other architects), having read th

* *Facts about Pompeii: its Masons' Marks, Town Walls, Houses and Portraits. With a Complete List of all the Masons' Marks cut in the Stones.* By H. P. Fitzgerald Marriott. Illustrated. London: Hazell, Watson & Viney.

report of the sub-committee appointed to consider the question of "builders depositing priced quantities with architects," is of opinion that (in view of the position taken up by contractors in Manchester) it is the duty of this Society to recommend its members, in the interest alike of their clients and the public in general, to follow a certain practice, viz. :—

(a) That the quantities shall form part of the contract.
(b) That the quantities shall be priced and monied out to the amount of the contract sum produced at the signing of the contract, sealed up, and in the names jointly of the architect and the builder, deposited with a banker, or some third person who may be agreed upon, with instructions that the parcel is to be produced only on the joint application of the parties.

(c) The architect to have the right to check the carrying out of the items in the deposited copy when it comes into his hands at the squaring up of the contract, and also to rectify prices on either side which are palpably incorrect (clerical errors), such rectification not in any way to interfere with the contract sum, but to apply solely to additions and deductions or extra works.

(d) All variations from the contract, both additions and deductions, and all extra works to the extent of 10 per cent. above the contract sum, are to be priced out at the rates named in the deposited quantities.

(e) All further additions above the 10 per cent. extra named in paragraph (d) are to be considered as additional works, and the prices to be subject to revision or confirmation, to be agreed upon, if practicable, at the time the works are ordered.

(f) All clear deductions from the contract, when there are no corresponding additions, or additions to an equal value in similar materials, to be priced out at 5 per cent. below the rates named in the deposited quantities.

(g) In all cases the period at which additional work has been executed should be considered when the prices are affixed at the time of the squaring up of the accounts.

The practice in the country may be judged from the official replies sent from Dundee, Glasgow, Leicester, Birmingham, Leeds and Yorkshire, the Northern Architectural Association, and Nottingham to the questions proposed by the Manchester Society :—

1. *How are contracts let, i.e. to one contractor, or divisible into separate trades?*

DUNDEE.—Each trade separately, viz. 1. Mason, excavator and bricklayer; 2. carpenter and joiner; 3. plumber; 4. plasterer; 5. slater.

GLASGOW.—Trades as a rule contract separately. The single contract is the exception.

LEICESTER.—In both ways.

BIRMINGHAM.—One contractor.

LEEDS AND YORKSHIRE.—Both ways

NORTHERN ARCHITECTURAL ASSOCIATION.—Both systems are in use here.

NOTTINGHAM.—To one contractor.

2. *If the former, is one contractor responsible for cleaning up during progress of work and at end of contract, and for making good damage to work?*

DUNDEE.—Usually a clause is inserted in schedule making mason responsible for clearing away all rubbish and waste, and he is paid for this.

GLASGOW.—Each contractor clears away his own rubbish.

LEICESTER.—At the end of each trade in the quantities a clause is inserted to the following effect, viz. make good after all other workmen, and leave all perfect at completion.

BIRMINGHAM.—Yes.

LEEDS AND YORKSHIRE.—Yes, but he sees that his sub-contractors do it.

NORTHERN ARCHITECTURAL ASSOCIATION.—The specification should define in each case.

NOTTINGHAM.—Yes.

3. *If the latter, who is responsible for damage to other works?*

DUNDEE.—Each tradesman is responsible for whatever damage he may do either to his own or to other tradesmen's work. If the party liable cannot be ascertained, then the tradesman whose work is damaged must repair.

GLASGOW.—Each is responsible for damage done to his own work.

LEICESTER.—The general contractor is responsible. In the case of separate trades contracts, this matter often leads to disputes, the architect generally settling who is to make good the damaged work.

BIRMINGHAM.—Contractor.

LEEDS AND YORKSHIRE.—Each contractor is responsible for all damage to his work.

NORTHERN ARCHITECTURAL ASSOCIATION.—The specification should define in each case.

NOTTINGHAM.—Yes.

4. *Are the separate trades responsible up to the completion of building, and after all his men are removed?*

DUNDEE.—Yes, except in case of fire. The proprietor insures against fire as soon as carpenter has done part of his work.

GLASGOW.—Each is responsible until the work is taken off his hand by the architect.

LEICESTER.—Yes, but we usually make the contractor-in-chief responsible.

BIRMINGHAM.—No.

LEEDS AND YORKSHIRE.—Yes.

NORTHERN ARCHITECTURAL ASSOCIATION.—The specification should define in each case.

NOTTINGHAM.—Main contractor.

5. *Does the contract sum remain as a fixture, or is the work remeasured at the completion?*

DUNDEE.—The contract sum remains a fixture. The work is not remeasured as a whole, but if necessary remeasurement is resorted to only with regard to items which either party can show reasonable cause for believing to be of greater or less extent than set forth in the schedule.

GLASGOW.—When the contract is a lump sum extra work only is measured and priced at the contract rates. In ordinary cases the whole work is remeasured.

LEICESTER.—If contractor can show that items in the quantities have been exceeded in the carrying out of the work, the addition is made at the schedule of prices. If architects find there are deductions, they in like manner make deductions at the schedule of prices.

BIRMINGHAM.—Contract sum remains a fixture.

LEEDS AND YORKSHIRE.—The contract remains a fixture; extra work and deductions only are measured at completion.

NORTHERN ARCHITECTURAL ASSOCIATION.—Deviations from contract only are measured up.

NOTTINGHAM.—Remain as a fixture, and measured if necessary.

6. *As to quantities and measurements, are quantities prepared by architects or by independent building surveyors?*

DUNDEE.—The practice in Dundee has always been for architects to prepare their own schedules of measurement, except when any individual architect may have been too busy, in which case he might employ an ordained measurer.

GLASGOW.—By independent surveyors.

LEICESTER.—By architects.

BIRMINGHAM.—Sometimes one, sometimes the other.

LEEDS AND YORKSHIRE.—Both.

NORTHERN ARCHITECTURAL ASSOCIATION.—Both systems are in use, but chiefly by architects and surveyor appointed by them.

NOTTINGHAM.—Quantities prepared by architects generally.

7. *Are quantities priced up and deposited with architects under seal or not, or are they produced by the builder only when required?*

DUNDEE.—After receiving the offers the architect calls in the schedule of the man whom he wishes to accept, and if he finds the schedule correct he accepts the offer, having previously given this contractor a blank schedule, so that he can keep a copy of his own prices.

GLASGOW.—They are priced up, and remain with the architect. As a rule the surveyor gets a copy.

LEICESTER.—The quantities are fully priced in and left with the architects, and after being verified they are sealed up if required by the builders and opened only for the purpose of making up certificates and adjusting the final account. As a matter of fact, they are generally left in the hands of the architects without being sealed up.

BIRMINGHAM.—Yes, not under seal.

LEEDS AND YORKSHIRE.—Deposited when the contract is signed, often not sealed.

NORTHERN ARCHITECTURAL ASSOCIATION.—Priced quantities (not under seal) are usually deposited with architect for his own use and in confidence.

NOTTINGHAM.—Priced quantities are deposited with the architects.

8. *How are extras and deductions dealt with at end?*

DUNDEE.—As a rule, extras and deductions are only allowed on the written order of the architect.

GLASGOW.—They are priced at contract rates, and the amount is added to or deducted from the original contract.

LEICESTER.—Measured up and priced according to the schedule where that applies; in other cases a day account is kept.

BIRMINGHAM.—Measured up.

LEEDS AND YORKSHIRE.—Are measured and allowed on schedule of prices in original contract.

NORTHERN ARCHITECTURAL ASSOCIATION.—Deviations from contract only are measured up.

NOTTINGHAM.—Adjusted by the architect on a fair basis.

9. *Are they priced at the same amounts in the original quantities, or are they agreed upon between the builder and architect?*

DUNDEE.—At the same rate per foot or per yard as in the original schedule if the work is the same as anything in the schedule; then by agreement.

GLASGOW.—At the contract rates for a similar work, but for a new description of work at rates agreed upon by architect and contractor before the extras are commenced.

LEICESTER.—Priced according to the original quantities where they apply.

BIRMINGHAM.—Same prices as in schedule, unless a special arrangement is made before the signing of the contract.

LEEDS AND YORKSHIRE.—Are measured and allowed on schedule of prices in original contract.

NORTHERN ARCHITECTURAL ASSOCIATION.—According to priced quantities, unless they do not apply.

NOTTINGHAM.—Priced bill of quantities forms basis.

10. *Are sub-contractors asked to give prices or information in reference to extras and deductions?*

DUNDEE.—No sub-contracts.

GLASGOW.—No.

LEICESTER.—If additional work is required, architects here negotiate with the contractor for the work.

BIRMINGHAM.—Rarely prices. Often information.

LEEDS AND YORKSHIRE.—If the contract is let in one, priced quantities are obtained from all sub-contractors; they are dealt with at finish as above.

NORTHERN ARCHITECTURAL ASSOCIATION.—If necessary, but through chief contractors as a rule.

NOTTINGHAM.—Sub-contractors' names are sent in with priced quantities, and extras and deductions settled with the sub-contractor.

11. *Or are these matters dealt with by the chief contractor solely?*

DUNDEE.—Solely between the contractor for each department and the architect.

GLASGOW.—By the chief contractor only.

LEICESTER.—They are dealt with by the contractor for the work. If separate trades tender, the architect would negotiate with each. If a general contractor is accepted, then all negotiations are made through him.

BIRMINGHAM.—Usually by the chief contractor.

LEEDS AND YORKSHIRE.—The questions are carried on through the chief contractor.

NORTHERN ARCHITECTURAL ASSOCIATION.—Yes, qualified as per reply No. 10.

NOTTINGHAM.—No; by sub-contractors.

NEWBATTLE ABBEY.

FROM time to time during the tenure of the mansion-house of Newbattle, Midlothian, by the present Marquis of Lothian, interesting discoveries have been made, says the *Scotsman*, concerning the remains of the old abbey, on part of the site of which the mansion-house stands. Newbattle Abbey (or Newbottle) was founded in the year 1140 by King David I., the "sair sanct for the Crown," for the monks of the Cistercian order. Of the architecture of the monastery of Newbattle nothing more is known from the records or chronicles than the meagre and half-authentic particulars collected by Father Hay. There is proof enough, indeed, of the extent of the abbey buildings. They could accommodate eighty monks and seventy guests with their retainers; and to entertain, as the abbey often did, the bishop and the whole synod of his diocese, to receive the sovereign and his court—for there is scarcely a king, from its founder downwards, who was not at Newbattle—must have required a large and spacious edifice. The abbey buildings were burnt by Richard II. of England in 1385, and again by the Earl of Hertford in 1544, during the disastrous expedition despatched by Henry VIII. to punish the Scots for their refusal to betroth the infant Queen Mary to his son. On that occasion the bonfires of what were known as the "bloody betrothal" were a line of blazing abbeys from Holyrood to Dunbar.

An old record says:—"Upon the 15th day of May the horsemen raid to Newbottill and brynt it, and oversaw Dalkeith be the moyane of George Dowglas, and brynt many other tounes theirabout. Na skaith was done to any kirks, except and thae destroyit the Abbey of Newbottill, and the same nicht they returnit to Leith." The burning of such a pile of masonry was perhaps but a partial destruction. In any case, it is related that a few years after the rough handling it received from the English, the abbey buildings were sufficiently restored to be thought a convenient place for the reception of a convention of the lords of the party, which the Queen Dowager in person held there preparatory to declaring war against England in 1557. The subsequent disappearance of the ancient abbey buildings cannot be accounted for in the usual way by alleging the violence of a Reformation mob. The Abbot of Newbattle of that day, Mark Kerr, whose portrait hangs in the mansion-house, embraced so heartily the principles of the Reformation that his dwelling would probably have been respected by the most zealous reformers; and as Newbattle has been a mansion for his descendants continuously since, we may rather seek the cause in a preference for modern comfort in a newer building, to the picturesque architecture and the pious and historical associations of the old abbey.

At the time of the Reformation Mark Kerr, as has been said, was Abbot of Newbattle. He was the second son of Sir

Alexander Kerr, of Cessford. Renouncing Popery, he expelled the monks and retained the lands as "Commendator of Newbattle," which title with all its privileges was confirmed to him by the Scottish Parliament in 1581. Scott of Scotstarvit states that Mark Kerr and his eldest son of the same name, who in 1606 was created first Earl of Lothian, "did so metamorphose the building that it cannot be known that ever it did belong to the Church by reason of the fair new fabrick and stately edifices built thereon, except only that the old name and walls of the precincts stand;" and more recent members of the house of Lothian have further extended and modernised the structure.

The grand old church, with its burial-ground, was effectually obliterated. Father Hay asserts, almost as an eyewitness, that "in the midst of the church was a tomb of the queen of King Alexander II., of marble, supported on six lions of marble. A human figure was placed reclining on the tomb, surrounded with an iron grating;" and it must be in the ground somewhere near the back entrance to the modern mansion that this queen (Mary de Couci) rests, as also Sir Alexander Ramsay, Sir James of Douglas, and many lords and ladies of the house of Lothian.

The present mansion-house occupies a portion of the area of the ancient monastery, and though ingeniously hidden by modern improvements the ancient masonry is still visible at parts of the walls, while here and there an antique moulding peeps out from its later setting. The picturesqueness and variety of line of the mansion-house show that it has gradually and in only a half-premeditated way grown to its present dimensions. The details of the architecture bear an Early English character, and have been assigned by a high authority—Professor Willis, of Cambridge—to the middle of the thirteenth century. This seems to show that the superstructure at least of the old abbey survived the successive burnings by the invading armies.

The remains of the old abbey, which the concealing earth had covered, were brought to light in quite an accidental way. The first discovery was made in 1878. While digging the foundations for an addition to the mansion-house, the workmen came upon the foundations of the old church. The Marquis, greatly interested in the work, caused extensive excavations to be made on the north side of the mansion-house, with the result that the nave, aisles and south transept were found. These were sufficiently marked on the grassy sward, the position and size of the nave and chancel pillars being indicated by cuttings, filled in with gravel, upon the grass. Again, in November 1892, some workmen employed near the mansion-house, digging pits in which to plant trees, struck upon a piece of solid masonry. In making further borings the mason-work was found to extend for some distance, and the Marquis then gave his clerk of works, Mr. Ramsay, instructions to have the matter thoroughly investigated. Systematic excavations were begun, with the result that the foundations of the north transept and of certain side chapels of the abbey were laid bare. The north transept had two angle buttresses of large dimensions, similar to those of the Cistercian abbey at Furness, in Lancashire; but in the case of that edifice the buttresses were at the angles of the chancel in the east end. The north transept has now been picked out on the grass, in the same way as the other parts of the abbey chapel. The visitor will note the great thickness of the east wall, and the great size of the chancel pillars.

Extensive excavations were again continued in 1893 and 1894, and have just been finished, both in the interior of the mansion-house and round about it. In the former case the excavations were connected with the complete restoration of the crypt. Those who know Newbattle will remember that from the entrance hall a grand wooden staircase leads to the spacious vestibule on the first floor, where are hung so many of the valuable art treasures of the mansion. But on each side of the grand staircase there are flights of stairs leading into the stone-vaulted and stone-ribbed crypts. Part of these had been dealt with in a former excavation; now the crypts have all been opened up, and extending across the mansion-house from north to south, form a beautiful addition to this interesting pile. The crypts both on the south and north sides of the portion immediately behind the grand staircase had been built up, and certain portions of them used as servants' rooms and lumber stores. The whole, as has been said, have been cleared out from end to end. Arches, where necessary, were thrown over the openings, and in the course of the work the bases of the old pillars were revealed in line with those now remaining in the crypt, which had a connection with the south transept of the church. After being hidden for centuries, these bases are still in perfect preservation with the masons' marks upon them. At this the north end, in what is called the Armour Crypt, an old chimney was discovered, which measured about 8 feet at the under side. At another place was discovered the old kitchen chimney, the under side of which measured 12 feet 6 inches by 6 feet. Both flues had the smoke of the old fires still upon them. The crypt pillars are octagonal. The plain shaft measures

3 feet 6½ inches in length, and each side of the pillar 7 inches. From the top of the capital, or spring of the arch, to the floor is six feet. From the pillar to the foot of the corbel, going from east to west, measures 13 feet 1 inch; from pillar to pillar, going from north to south, 9 feet 7 inches. The arches are circular. The ribs show five plain sides, each measuring 5 inches. The keystones—now all plain—may possibly have been at one time enriched with bosses, as some fine specimens of bosses were found while excavating the crypt. One of these old bosses is preserved and placed inside the crypt. From the keystone of the rib to the floor measures 12 feet. The inside length of the crypt now open from north to south is 100 feet by 27 feet 7 inches wide. The crypt, it is conjectured, had extended from the south transept southward towards the river for about 200 feet, inside measurement. The bases of the pillars of the great hall and chapter-house were discovered towards the east of the crypt. The size of the base of the great hall pillars is 5 feet 9 inches by 5 feet. The chapter-house pillar bases were 3 feet 7½ inches by 3 feet 5½ inches, finely moulded in the Early English style. The great hall pillar bases may be seen; the chapter-house pillars are marked in one of the small courtyards of the mansion. The whole of the crypts save one have been laid with polished oak, and, being appropriately furnished, they form quite an addition to the show portion of the mansion-house. The exception made is a small crypt on the west side, which apparently was the old abbey kitchen, for it was here that the great chimney was found, and at one side of it is also an ancient oven. The flooring of this has been treated in quite a novel way. During the excavations at Newbattle Abbey a large number of old and curiously-shaped flooring-tiles were found. They were hand-cut, from 1¼ to ½ inch thick, with a fine glaze or enamel of various colours, such as yellow, green, red, black and brown of different shades. These of course, along with other curiosities found, have been carefully preserved. The Marquis instructed his clerk of works to have the floor of the kitchen crypt, as it may be called, covered with an inlaid wooden floor, the pieces of wood of which were to be of the size and shape of the old tiles found. No pattern was to be used unless there was an old tile design to correspond to it. The designs were geometrical in character, but some of the tiles had inlayings in the shape of fleur-de-lys, conventional roses, &c. The work of reconstructing a design for the flooring conformable to the old patterns was a task of great difficulty, but it was successfully accomplished, and the greater part of the inlaid flooring has been laid with effective results. The flooring has been made and laid by the estate workmen, on whose taste it reflects great credit. All the wood used was grown in the park, and a fine effect has been secured by using various coloured veneers, such as yew, oak, maple, laburnum, plane tree. The great fireplace has been boarded over, carved screens set at each side, and with a step up from the floor, where the great hearth of the fire had been, the little crypt, which is well lighted by modern windows on the front of the mansion-house, has assumed quite an ecclesiastical aspect.

Passing outside again, it may be noted that at the west end of the abbey church towards the south were found the foundations of the west wing, with a portion of the old stair leading from the dormitory to the church. The width of this wing inside the walls is 28 feet 6 inches. About the centre of this wing, 80 feet from the north wall of the abbey church, the main entrance to the cloisters was found. Outside the doorway were three steps, 5 feet 6 inches by 10½ by 6 inches deep, and the size of door between the jambs was 4 feet 9 inches, and the width of passage through to the cloister garth was 6 feet 2 inches. The walls were of ashlar-work. The outside wall of this wing is 3 feet thick, and of that next the cloisters 2 feet 6 inches thick. One of the chambers south from this entrance to the cloisters was 68 feet long by 23 feet 9 inches wide; it seems to have been groined, and would possibly be a continuation of the dormitory. The bases of four pillars were found in this chamber, and as all were of different design the shafts would also be different. The one next the south was like a quatrefoil; the second to the south was circular, with zigzag moulding round the base; the third from the south was octagonal; and the one at the north end was a circle, with dog-tooth moulding round the under shaft. About 40 feet from the end of this chamber a wall was found extending east and west, having on each side a stone-built arched culvert of ashlar-work, 2 feet 6 inches wide by 2 feet 6 inches high. It was about 4 feet from the present surface, and had evidently been the old underground waterway for cleansing purposes of the abbey. The foundations of the refectory walls were found extending east from this chamber, but north and south as they usually are placed. They contained a fine moulded doorway near the south-west corner of the cloister quadrangle. The moulded jambs had a bay of 3 feet from the door outwards. The jamb moulding was Early English Gothic. Unfortunately these excavations were right in front of the main doorway of the mansion-house, and after careful examination had all to be covered again with soil. The door just men-

tioned was found right in the middle of the carriageway, but of it a full-sized drawing was made by the clerk of works. The south boundary wall was found extending east and west by the bank of the South Esk, near to which the abbey stands, while the boundary wall from the west wing already referred to extended southward and joined the other by the river bank. They were 3 feet in thickness. As the excavations proceeded Mr. Ramsay, clerk of works, made most careful measurements of the walls and foundations, and from these he has prepared a ground plan of this grand old abbey, which, if not quite complete, is approximately so, and gives one a true appreciation of the dimensions of this ancient pile. The length of the great hall and the size of the chapter-house cannot be ascertained, as the east end of both are covered by the present mansion. As already stated, the walls and pillars and transepts of the church have been carefully marked on the lawn over the buildings. A brown glazed fire-clay edging, unobtrusive in colour, has been used. The great door on the west front has also been outlined with this edging.

The excavations were made to a depth of from 3 feet to 4 feet 6 inches from the surface of the present ground, and the principal details of the old abbey as laid down on the ground-plan are:—

Church.—Extreme length east and west outside walls, 253 feet 3 inches.

Extreme length east and west inside walls, 239 feet 3 inches.

Extreme width north and south outside walls, 66 feet 7 inches.

Extreme width north and south inside walls, 57 feet 1 inch.

Extreme length of nave, 161 feet 6 inches.

Extreme width of nave, 31 feet.

Extreme width of aisles, 13 feet ½ inch.

Extreme length of crossing, 41 feet 9 inches.

Extreme length of chancel, 36 feet.

Extreme width north and south between transepts, 117 feet.

North and south transepts, east and west (inside), 45 feet 6 inches.

North transept, north to south, 32 feet 3 inches.

South transept, north to south, 28 feet 2 inches.

North wall in north transept is 8 feet thick.

Other walls in church and transept, 4 feet thick.

South wall of church, next cloisters, 3 feet 6 inches thick.

West front wall of church, 6 feet 6 inches and 8 feet thick.

Buttresses on the north aisle, 4 feet by 5 feet out from wall.

Angle buttresses at north transept, 16 feet 4 inches by 10 feet 4 inches.

Corner buttresses at east end of church, 12 feet by 3 feet out from wall.

Buttresses north and south side of chancel, 8 feet by 3 feet out from wall.

Buttresses east of chancel, 6 feet by 3 feet out from wall.

Octagon.—Base of four pillars under the great tower, 10 feet by 10 feet.

Base of two pillars in chancel, 10 feet by 10 feet.

Base of pillar in north transept, 7 feet 10 inches by 8 feet 3 inches.

Refectory, length inside 106 feet.

Refectory, width 33 feet 6 inches.

Cloister quadrangle, 125 feet 10 inches by 123 feet 10 inches.

Width of chapter-house, 28 feet.

Width of great hall, 43 feet.

Width of sacristy, 18 feet.

From the north wall of the abbey church to the south boundary wall of the river is 378 feet 4 inches, and from the south boundary wall to the wall at the culverts is 186 feet 6 inches.

The foundations of the outside wall of the old burial-ground, which was on the east and north of the church, were also found—not straight, but with a gentle curve from north to east by south. They were 3 feet thick. While digging in this portion of the ground a number of stone coffins were found, principally outside the chancel and north transept. These were mostly of loose slate. One coffin of polished ashlar was discovered near the south transept entrance from the cloisters. One or two of the coffins were opened and were found to contain the bones of well-built men. All the coffins disturbed were carefully replaced, and like the other excavations this part has also the grass growing upon it again. In the cloister quadrangle was found an old stone-built well, 3 feet in diameter and 14 feet deep. Below that it was full of rubbish. Several interesting relics of the last burning of the abbey were found in the shape of pieces of the charred beams and of the old bell of St. Marie de Newbattle, which had been molten by the fierce heat. One of these pieces weighs about 16 lbs., and there were many other fragments. A small silver coin of the reign of James IV. of Scotland, whose young bride, Margaret Tudor, was entertained at Newbattle on her journey to Edinburgh, was also found.

It is not generally known that the Marquis of Lothian, with great consideration, allows the mansion-house and abbey to be opened to visitors every Wednesday and Saturday when the

family are not in residence there. The pictures are most valuable and interesting, and archaeologists and architects will find much in the recent excavations and improvements at the abbey to which to devote attention.

THE STUDY OF ART.

AN address was delivered by Mr. George Clausen, A.R.A., at the distribution of prizes to the students of the Stoke School of Art. He said he had always felt an indebtedness to those artists who had helped him in his student days with their advice and encouragement, and he regarded it as a privilege to address for the first time in public a gathering of students. The fact that artists were always willing to help one another was a real proof of their brotherhood. Whatever branch of art they practised, it was their duty to make good to the best of their ability their claim to the great brotherhood of art, a brotherhood that was, perhaps, the biggest in the world, the most inclusive, and the most exclusive, for they could claim a real and living relationship with the great minds of the past. It was good for them as artists that those men were living and speaking in their work to-day. The universal language of art knew neither time nor space, and spoke to them from remote periods of antiquity. It should be a pride to them that the art of the potter had left the world a richer legacy of beauty and interest than any other branch of art. Their simply turned productions in clay, while being the most fragile substances, were also the most imperishable, and through the long course of history down to the present day they found that the extent of a nation's civilisation and progress in the arts might be measured by the evidence accorded by the pottery of various periods. So that they in that district might be described as the lineal successors to a very great inheritance of beauty, and therefore they had a direct interest in and a reason for the study of art. Art was an individual matter. Everything that they as students of art did must have first come to them from without, either from nature or the works of great masters. The whole object of their work should be first to train the eye and hand, and, secondly, to acquire a standard of taste. They must not try to cultivate style. Their own style would come, for they could not eliminate their own personality from their work. They must endeavour to find out what it was the masters saw, but they should not take a theory for granted until they had satisfied themselves of its truth, and in following the ideals of their choice they should try to follow the example and not the individual. They should not only endeavour to become good draughtsmen, but they should let their general study be as wide as possible. They should strive to study everything for the beauty which was in it, and if it be that they were unable to originate work they would be none the poorer for enlarging their conception of beauty in art and nature. Doré declared that art was a hidden thing and that it was for artists to drag her forth. The question, however, would come to each of them, how were they to employ their skill? And the answer would depend upon the measure of their ability. They must remember that all their studies in the past were not in themselves an end but the means to the attainment of the end, which was that they might impress their work with their own individuality. In the potter's art there were many who had obtained distinction for the individual character of their work, amongst them he might mention M. Solon. It was difficult to say how far it was possible under the present conditions of work to prevent the effacement of the artist's individuality, but for a man there was always a way where there was a will. Although there were many more openings for young students of art than there used to be, he considered the area of what was held to be artistic needed to be widened. He was not one of those who took the view that painting and sculpture were the only fine arts. All forms of art were fine arts. But the painter and the sculptor had an advantage over all other art workers in that he was able to assert his individuality and obtain personal recognition more readily. What he wanted to urge was that all art was united and could not be separated. It would be a good thing if manufacturers would as far as possible help young men to develop their ideas.

TESSERÆ.

The Walls of Babylon.

THE walls of Babylon have been a fertile source of exaggeration, but allowing for this they must have been extraordinary works, and to the dwellers in the open plain they formed the only means of defence. According to Diodorus Siculus, there was sufficient space within the outer walls of Babylon not only for the gardens and orchards, but to cultivate corn enough for the subsistence of the whole population in case of siege. The citadel was the holy place, where the palace-temple stood, where the treasures were kept, and where were preserved

the records of the kingdom carved in stone; it was also the place of refuge in time of danger. This sacred ground was elevated above the other buildings, both to give dignity to the palace-temple and strength to the citadel. In those plains where no natural eminence was at hand a regular platform of crude brick was constructed 30 or 40 feet in height; the custom of building on elevated ground still exists, and many of the ancient mounds are occupied by a modern citadel. It was to defend this sacred enclosure that those huge walls were built, so often celebrated by ancient authors. Herodotus speaks of the walls of Babylon as 300 feet in height and about 75 feet in thickness, and according to Diodorus, the walls of Nineveh were 100 feet in height, and so broad that three chariots might be driven abreast upon them: 1,500 towers were built at intervals along the walls, each 200 feet in height. Whether these dimensions be correct or not, it is certain that the fortification must have been of prodigious strength, as, in the reign of Sardanapalus, Nineveh was only subdued by the combined forces of the Persians and Babylonians after a siege of nearly three years. At certain distances in the wall were the gates, either flanked by towers or ornamented at the entrance by gigantic figures, such as the winged bull. The exterior of the wall was frequently cased with square slabs, most probably of native alabaster, and was decorated with paintings. Ezekiel speaks of these paintings, "For when she saw men portrayed upon the walls, the images of the Chaldeans portrayed with vermilion, girded with girdles upon their loins, exceeding in dyed attire upon their heads." Diodorus says that on the outside of the principal palace of Babylon built by Queen Semiramis figures of men and animals were painted, and that the paint was laid on the bricks before they were placed in the furnace. Some enamelled bricks have been found at Nimroud on which the colours appear to have been thickly laid in a liquid state and afterwards baked in.

The Campo Santo, Pisa.

Extraordinary interest attaches to the Campo Santo at Pisa, as one of the nurseries of painting before it could well stand erect, justifying a brief recurrence to the treasures it contains. On the walls of that extraordinary cemetery are embodied, in pictorial form, many of the most interesting subjects which can affect mortality. The *Last Judgment*, by Orcagna, which served Michel Angelo as a model for certain portions of the great work which has rendered him immortal, exhibits the most wonderful energy in giving tangible form to the Dantesque conception of the subject. Throughout Italy remains of the mosaic style are to be traced in the fresco paintings, and nowhere are they more manifest than on the walls of the Campo Santo at Pisa. The adoption in fresco of simple geometrical figures, which did not interfere with the curved lines of the composition, and which gave a "mosso," or movement to the groups (just as architecture introduced in a picture gives life and vitality to the delicately-modelled surfaces), was in every respect most valuable. The gold of the mosaics which was at first retained by the fresco painters began to disappear, its use being principally confined to the delineation of the nimbus or circle that surrounds the heads of the saints, executed in a sort of raised and stamped plaster, and to different ornaments about their persons, as a gold key in the hand of St. Peter, &c.

The Primaries in Decoration.

It is well known that if blue and red come together without the interposition of white, they would each become tinged with the complimentary colour of the other; thus, the red would become slightly orange, and the blue slightly green. As all coloured bodies reflect some white rays, the white in juxtaposition, by its superior force, extinguishes these white rays, and we see the colours purer, at the same time that the white becomes tinged with the complimentary colour of that against which it is placed. As one of the objects of decorating a building is to increase the effect of light and shade, the best means of using blue, red and yellow is to place blue, which retires, on the concave surfaces; yellow, which advances, on the convex; and red, the colour of the middle distance, on the horizontal planes; the neutral white on the vertical planes.

Flesh Painting in Windows.

We sometimes hear it disputed whether the flesh ought to be coloured or left white in a glass painting, the opponents of tinted flesh urging the impossibility of imitating nature exactly in this respect. The answer is obvious enough. The whole colouring of a glass painting is highly conventional, whether it be of the draperies, of the flesh, of the sky or of any other object; still, so long as it does not exceed the limits of conventionality—a point to be ascertained only by observation and general opinion—the eye and imagination are satisfied. We should be startled and disgusted at seeing flesh painted green or blue, but the complacency with which pink or white flesh in a glass painting is regarded by the generality of mankind is a sufficient proof that neither of those tints contradicts nature too violently, and therefore that the artist does not exceed the limits of conventionality in using either white or tinted flesh at his discretion.

NOTES AND COMMENTS.

WHEN it was proposed to paint the walls of the Houses of Parliament, the German fresco-painters became the monitors, and their account of their own practice was supposed to be the best guide for the English artists. Nobody at the time had any misgiving about the endurance of the recently painted German works. The foreign recipes were adopted, and the result is the deplorable spectacle on which Professor CHURCH has been reporting. For a long time the frescoes in Munich, which inspired the English experiment, have been decaying, and it is impossible to make out the subjects which some of them represent. The Prince Regent, who is courageous, has resolved to attempt the renewal of half a dozen of the historical frescoes in the arcades of the Hofgarten, and gave commissions to three painters. Full liberty is granted in dealing with the old work, and if the remains have to be removed and entirely new pictures substituted, there will be no discontent, at least among the courtiers. The frescoes representing landscape scenes, which at one time gave rise to much interest on account of their novelty, will remain as they are until more is known about the effect of the operations on the figure-pieces. If the experiment is successful, we suppose the frescoes on the exterior of buildings like the Art Galleries, the Post Office, &c., will also be renewed. In Italy the old frescoes excite a sort of pity, for it is felt they have succumbed to time, but in Munich, as in Westminster, the decay is only evidence of incompetence.

AT the first annual dinner of the Dundee Institute of Architecture, Mr. LESLIE OWER, the vice-president, offered a suggestion which is worthy of attention in Scotland. He said the time was ripening fast for a Scottish Institute of Architecture, and that was a step which they ought to bring about. With the Universities of Edinburgh, Glasgow, Aberdeen, St. Andrews and their own College, he saw no reason why a Scottish Institute should not have a system of examination as fully equipped as the Royal Institute of London. Comparatively few Scottish architects were connected with the latter body, which had never quite gained the sympathies of the profession in Scotland or in England. Such an Institute as he desiderated would raise the status of the members of the profession, and elevate the standard of art amongst its members. In Scotland they have a logical way of considering things, and it must often be asked by others as well as by Mr. OWER, What is the advantage of going southwards to undergo an examination which was got up solely to suit English weaklings, or to seek membership in a Society that is unknown in the north? The influence exercised by the Dundee Institute is proof of what can be done by architects who are not hampered by rules that are inappropriate in Scotland.

MR. WATERHOUSE, R.A., has awarded the prizes in the competition for the new hotel to be erected by the Belfast and County Down Railway Company at Newcastle. Mr. JAMES J. FARRELL, of Dublin, has carried off the first prize of 100*l.*, which of course was satisfactory to the directors, as they could not be charged with calling in strangers. Messrs. GIBSON & RUSSELL, of Gray's Inn, London, were awarded the second prize of 75*l.*, and the third prize of 50*l.* fell to Mr. F. H. TULLOCH and Mr. LIONEL LITTLEWOOD, of Westminster.

THE freemen of the Company of Playing Card Makers honoured themselves when they conferred the honorary freedom of the company on Sir A. W. FRANKS, the keeper of British and Mediæval Antiquities in the British Museum. He has rendered invaluable services in endeavouring to trace the history of cards, but it would be difficult to find any class of ancient work which Sir A. W. FRANKS has not elucidated. He is the most learned officer of the British Museum, and without him it would soon sink to an inferior level. But the generosity of Sir A. W. FRANKS is on a par with his knowledge of antiquity. There is scarcely a year passes without his enriching the national collections, and in that way he has expended a small fortune. The Master

of the Company of Playing Card Makers estimated the value of the gifts of Sir A. W. FRANKS at 50,000*l.*, but, unless we are mistaken, a much larger sum would more correctly represent his expenditure in securing treasures of various kinds for the British Museum.

THE last number of *L'Art* contains about two hundred pages, and may therefore be considered as a volume rather than a periodical. Few volumes published recently possess so much interest for artists and amateurs. One of the etchings gives an admirable "impression" of a part of Paris on a wintry day. Another of the Comtesse DE MERCY D'ARGENTEAU expresses a combination of sweetness and suffering. M. EMILE MOLINIER has a learned address on the "Origins of the Decorative Styles of the Middle Ages," in which the influence of Eastern models is explained. M. CHESNEAU presents another instalment of his investigation of the principles of pre-Raphaelitism, which would do credit to any English student of the movement. M. PAUL LEROI, with his customary omniscience, treats many subjects, and among others the career of the late PIERRE VICTOR GALLAND, who was rarely surpassed as a decorative artist, while his easel pictures were sufficient by themselves to make a reputation. The illustrations in the pages are numerous, and exemplify many varieties of modern work; the initial letters by M. HABERT DYS are not the least remarkable. Altogether the part has permanent interest, and is creditable to the enterprise and good taste of the conductors.

THE rumour about the purchase of the Château de la Muette outside Paris by an English company, with the intention of covering the grounds with villas in the latest style, has disquieted Parisians. Their interest in the place is incomprehensible. That FRANCIS I. built a kennel there, that LOUIS XV. reconstructed the buildings which became the "Parc-aux-Cerfs" of ignoble memory, that MARIE ANTOINETTE supped there with DU BARRY, that the first balloon ascended from the grounds, and that the municipality gave a banquet to fifteen thousand guests in the gardens may be granted, but all these associations are of no importance. Of the old château only one pavilion remains, and it is of little architectural interest. There are of course the gardens, which are the more remarkable from their position so near Paris. The ground is undoubtedly a tempting sight to a building speculator, stretching as it does from the Bois de Boulogne to the railway station at Passy, and sooner or later it is certain to be utilised for building sites; but for the present there will be no change. Count DE FRANQUEVILLE, who represents the family of the ERARDS, the piano makers, who since 1820 have possessed the property, declines all the offers made to him. But it is remarkable that the Parisians should take so much interest in a place where kings and citizens took pleasure in degrading themselves.

It could hardly be expected that the sacrifice of the Palais de l'Industrie on the Champs-Élysées, in order to allow of the construction of a new approach to the International Exhibition of 1900, would be approved by the artists who have gained reputation by the Salon exhibitions. M. BOUGUEREAU has lost no time before protesting against the demolition. He maintains that not only the Palais, which he says cost 12,000,000 francs, will be sacrificed, but the beauty of the Champs-Élysées, the most beautiful of promenades, will be affected, or rather massacred, by the proposed innovations. M. BOUGUEREAU says he will be charged with a desire to maintain the Salon at all costs. He asks in reply whether that institution is not one of the glories of France, and one which excites the envy of other nations? On that account is it not the duty of all Frenchmen to endeavour to conserve the Salon? Who would care to see French artists compelled to seek in foreign cities the galleries in which their works should be exhibited? The authorities of the Exhibition declare that the artists who are attached to the Salon will not suffer by the proposed works, but who can guarantee that the artists will be provided hereafter with galleries gratuitously, as is the case at the present time?

NEW CO-OPERATIVE BRANCH STORES, PICTON STREET, LEEK.

THE buildings which we illustrate are about to be erected to the plans and under the superintendence of Messrs. W. SUGDEN & SON, F.R.I.B.A., at a cost of 1,000*l.* for the first section of grocery stores only, and the enclosure and gravel paving of the site for extension, and the general sewer. The drapery and meat stores will be built later. The grocery store is 40 feet by 20 feet. The warehouse, &c., floor area—in cellaring and on ground and first floors—in connection with it, is about 430 square yards.

The advertisement for tenders contained the following proviso:—"The architects are instructed to require the payment to the workmen of the standard union rates of wages, and not to permit the introduction of 'sweated' goods. A schedule of hours and wages (as in London County Council works) will constitute part of the contract." So far from this acting as a deterrent to respectable builders tendering, out of the twenty-six builders (various trades) in Leek tenders were received from twenty-two, a very unusually large proportion. Tenders were only invited from Leek builders, the co-operators preferring to find work for their own townspeople.

The present building will have glazed brick brown pillars between the oak shop-fronts, and cream-coloured glazed brick linings internally where necessary. The upper storey will be rough cast outside, the woodwork being painted a bright green, insuring, with a red-tiled roof, a simple effect of cheerful colour. The larger portion of the flooring will be fireproof, of an inexpensive character. The heating will be by low-pressure hot water, and the flour-shoots and bins, &c., and other fittings, will be of the latest and most improved types.

ALMSHOUSES, FORD, BIDEFORD.

THE almshouses are built on the main road from Bideford to Clovelly, on the site of the birthplace of the donor, who has adequately endowed the foundation as the habitation of two elderly couples of Alwington; Parkham or Buckland-Brewer. They are built of a wrought grey local stone, with Bath freestone dressings. The whole of the internal fittings are in pitch-pine, and the walls ornamented in sgraffito plaster in three colours.

A tablet of polished granite bears the following inscription:—

"1893. To the glory of God, these Almshouses are erected by JAMES COLMER for the benefit of the poor of his native parish. 'All things come of Thee, and of Thine own have we given Thee.'—I Chron. xxix. 14."

The architect is Mr. ALEXANDER LAUDER, of Barnstaple, and the builder, Mr. R. LOTT, of Ford.

THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

Mr. BANISTER F. FLETCHER, in the absence of the author, read the following paper:—

Specifications from an Architect's Point of View.

Mr. Pinks, the author, said:—In reading a paper before you with the title of "Specifications from an Architect's Point of View," a word of explanation is necessary perhaps to account for a surveyor undertaking the task. Our interests are identical, and as the surveyor is frequently left to explain the architect's intentions in the specification, there is no reason why he should not be able to look at the matter from the architect's point of view. Of course, you must understand I am speaking my own views only in what I am about to say, and not those of any architect or architects in particular; but I hope the remarks I have to offer will not be considered out of harmony with the title of the paper.

I regret I cannot introduce to your notice anything novel or

fresh in the art of writing and arranging the clauses of a specification; neither can I suggest any improved or rapid method of preparing the document. But I propose to examine critically the specification as it is; to pass from that to a consideration of the necessity of specifications as they are at present drawn, and thence to a few suggestions for the abolition of specifications as separate documents in a contract.

Take one of the latest of our specifications. Does it not strike you that it is an inordinately lengthy document as compared with those written, say, twenty years ago, and that a mass of matter is now squeezed into its pages that serves only to perplex the clerk of works and worry the builder? Does there not seem a desire to make a record of length and number of pages? Why, even a moderate-sized house requires at least 100 pages of specification nowadays to adequately describe the best way of building it. Perhaps you may urge that a great deal of this is due to the fact of the surveyor writing the specification, but that is not really so, for if a surveyor had his way he would make the specification simply a reduced copy of his bill of quantities, and a specification frequently exceeds the number of pages of the bill of quantities. I think a great deal of the extra length can be accounted for by the introduction of most of the "conditions of contract." These properly belong to the "contract" as the legal document, and only cumber the pages of what should essentially be the working document. An objection also to the incorporation of legal clauses with those necessary for the builder's guidance is that a possible slight variation in the language of a legal clause which appears in the specification and contract may lead to litigation to settle the difference. I know of a case in which the specification gave as the time to complete the building eighteen months, and in the contract, by an error, it was stated as eight; but it caused much delay and squabbling before the difficulty was settled.

Another cause of lengthiness is the way in which expanded descriptions of trade manufacture are worked in. I saw a specification the other day in which the architect or his surveyor had devoted some three or four pages to a technical description of how to make terra-cotta. I do not suppose the makers would be influenced in the least by this, certainly not the builder, for each manufacturer would have his own way of doing it, and would not vary the custom of his works to suit a particular specification.

Do the wonderful little essays on how to lay drains, make terra-cotta, mix cast-iron, test steelwork or ironwork, which we find in so many specifications, protect our clients or help forward to any serious extent the good and efficient workmanship and materials we all desire to see?

The system of splitting up a specification rigidly into trades has much to answer for in introducing elements of confusion and differences. Each architect has his own view as to where a certain article should go, and if he consistently follows out the trade system, what a number of references have to be made before you find out all about a window, for example. On one page the sash and frame; on another probably the fastener and sash-lifts; on another the iron tongue; on another the linings and architrave; elsewhere the glass, and so on. There are many of these cases where four or five references might be profitably put together, especially when you remember that the practice of allocating the items under trade headings differs considerably. For instance, tile-pavings and wall-linings get put into the bricklayer by some, mason by others and plasterer by others. Then the concrete-bed for the tile-pavings and rubbish under, and the cement surface for laying the tiles on get into different sections, and so in a simple tile-floor we may have to make four or five references before we get it complete. I need not mention many other instances of the difficulty of breaking up the specification into trades, as they will occur to all; but what I want to emphasise is that a great deal of time might be saved by combining things together a little more than is done, and let the trade distinctions take care of themselves.

The phraseology of the modern specification also leaves much to be desired, especially in the constant use of words defining quality. The words best, very best, proper, perfect, &c., are all relative terms of quality which frequently are quite differently interpreted by the architect and builder, the one using the word in the ordinary sense and the other in the manufacturers' sense. It is no uncommon thing to find in a trade catalogue the expression "extra super best," as meaning something superior to that described as "best;" and although it seems absurd to encourage such superlatives, if you want the best you have to go beyond the ordinary English meaning of the word, and accept the grandiloquent language of the catalogues. The word "proper" is a frequent stumbling-block, and its use should be discouraged as much as possible, especially in the sense in which we find it, as for instance "fir proper door frames." These relative terms of quality should be quite abolished, and the definite expressions of the manufacturers used instead, as by so doing we shall, as regards materials at all events, have a common basis of agreement with the builder. At present quality is left too much to the imagina-

tion, and is only implied when it can and should be stated in exact terms.

A common defect is the frequent disagreement between the specification and the drawings it is supposed to describe. In the great majority of cases this arises from the habit of writing a specification and using an old one as a model, and so we get materials specified which the architect does not intend to use, and when the work is being carried out points of difference arise. If quantities are supplied the surveyor can easily adjust the variations in description; but, assuming their absence, each person tendering puts his own construction upon the clause, with the inevitable result that whichever way the architect wants the work done an extra ensues. Of course there are builders and builders, and the architect has to be prepared for the worst type in these days of close competition.

I think the subject can be narrowed down by asking yourselves which do you consider the most important part of the contract—the specification or the drawings? I need not pause for a reply, because, of necessity, the drawings must be the paramount factor with the architect and builder, although the employer often attaches more importance to the specification, probably because he understands and can criticise a written description, whereas, alas! drawings to the average employer are like maps to a South Sea Islander.

Does it not come to this, then, that more work on the general or small-scale drawings, and less in the specification, would tend to considerably reduce the friction between architects and their clerks of works and the contractors? Carry this idea to its legitimate conclusion, and half the causes of dispute would disappear.

This brings me to the second division of my paper, viz. a consideration of the necessity of specifications as they are at present drawn.

You will perhaps have gathered from my remarks that I am not in favour of lengthy specifications, and I must confess I think they are drawn out to an unnecessary length, without the least equivalent in the way of further security from bad materials or scamped workmanship. And I now have further to admit my conviction that the specification goes out of its way and out of its true course when it ceases to be anything more than a description of materials. It seems to me that the necessary documents or instruments of a contract should be, first, the plans, elevations, sections and detail drawings; second, the description of the materials to be used, which of necessity must be a written document, and for convenience is called the specification; third, the conditions of contract or legal restraints by which you bind the builder to do the work in accordance with the plans and specification, and also bind the employer to pay for the work done.

To successfully carry out this idea it will follow that the small-scale drawings must be prepared with perhaps a little more care and with considerably more detail than they generally are at present. I believe much greater attention is being paid to the small-scale drawings than used to be the case, and I know many architects whose drawings are so clear, detailed and annotated that a specification is almost a superfluity. From this I know it is possible for the thing to be done, and if it were adopted as a system it would be perfectly easy for the draughtsman to add, either by writing or graphically, to the general drawings most of the information which now burdens the specification.

For instance, taking the elevations, why should you not express, once and for all, by printing on the drawings the facings you want, the arches, whether axed or rubbed, the parts of the work in Bath, or Portland, or in both, the parts to be cemented or rough cast, the windows which are to open and which fixed, the glass to be used, and many other things? On the plans, why should you not say what flooring or paving you require, what the hearths are to be, what thresholds, what roof-covering? On the section, the sizes of floor-joists and roof timbers, the descriptions of skirtings? Once on the drawings they are done with, few queries would arise, the surveyor will get through his work quicker, the foreman and clerk of works will not be divided between something on the drawings and a contrary description in the specification.

This all may mean rather more work for the architect at first, but will not the apparent loss of time amply repay him in the end, and certainly save delay on the works? A specification of one hundred pages takes quite a week to write, and even then is by no means a perfect document. Human fallibility enters very much into specification writing, and it is impossible in a written document to notice small errors without a close examination; whereas a drawing can be read by those who make them, and errors detected literally at a glance. Supposing, instead of devoting a week to writing a specification, you gave that week to finishing up and noting the drawings, what a tremendous difference it would cause. I am sorry to suggest more work to those who, perhaps, are already fairly burdened; but I believe it would be more congenial to the majority to spend the week on the drawings rather than on the dry work of specification writing.

Surveyors do occasionally find a set of drawings with all the sizes of timbers figured on, and what I now plead for is an extension of that principle to almost every detail in the building. To satisfy these conditions a set of drawings would have to include a little more detail work, especially in the sections, and the draughtsman would have to put his section lines where they would show most work, instead of shirking the stairs and the lantern lights, as they often do at present. A plan of the roof timbers would also be desirable, and some of the joinery details should certainly be among the drawings.

Assuming you intended carrying this idea into practice (of putting work on the drawings instead of into the specification), the following, I think, would be the additions:—On the plans: the floors would have the material stated and the thickness; as to how the floors were to be laid and the kind of jointing, that would remain in the specification without a detail showed it. The pavings also would be described, and the hearths, steps, stairs, the direction of the joists and strutting, and the trimmers and trimming-joists which might not possibly appear on the sections. On the sections: the skirtings, dado and picture rails, cornices, architraves, thicknesses of doors—description of plastering, whether cement or lime, also the dadoses and tile-hangings. On the elevations: the facings, arches, mouldings, rough cast, timbering, tile-work, what windows fixed and which to open, the glass, the external doors, the window-sills, steps and stonework generally. The roof plan would show at a glance which slopes were to be covered with inferior and which with better slating, also the lap, and whether boarding and felt; the roof, whether tile or lead, the flashings and lead flats, and every other item which at present it takes a few minutes to find in the specification.

This system would save all the difficulty one experiences in trying to locate the position of a certain thing, say a roof slope; you use up all the points of the compass, and you find one part which will not fit in to a concise description. The surveyor takes the slates, say, as of the superior kind, the builder, perhaps, reads it differently and puts the inferior kind. If the drawing showed by a note or distinctive colouring which was meant, all must read it in the same way.

From the drawings we turn to the specification, as I suggest it should be, and we shall find more than 75 per cent. of its bulk is gone. In the preliminary part all the legal clauses, such as protection, damage, insurance, payment, time, sureties, rates of wages, will all be relegated to the contract. In the excavator and bricklayer all the descriptions of materials will remain in, and the way they are to be mixed and used, but all such items as depths of excavations, thicknesses of concrete, beds of brick rubbish, thicknesses of walls, mortar, fireproof floors, drains, facing bricks, parts in cement, finishings of internal walls, arches, moulded and gauged work, air bricks—all these would be cut out, as the drawings would show them.

The mason would describe the materials and setting; all other work would appear on the drawings. The slater also would describe the materials and nails to be used. The carpenter would give the usual descriptions as to materials and a general clause about providing all wood, bricks, fillets, slips and backings. The joiner would also give the description of materials and method of laying and jointing the floors. Sizes and number of hinges, and prices of locks and furniture (although this could be quite easily put on the details). The founder and smith would state descriptions of materials and tests, also any ironwork hidden away. All straps and bolts, railings, girders and joists, rain-pipes and eaves-gutters would appear on the drawings. The external plumber's work would all appear on the drawings, and only the materials specified. The internal plumber-work is a little more difficult to dispose of, and until detail drawings are given for this work it would have to remain in the specification certainly as regards small pipes and taps. The plasterer would only describe the materials and the proportions. All glass would be indicated on the drawings, and therefore the trade would consist of a line or two. The painter would remain very much as at present.

I have taken a specification of 120 pages, and by cutting out the items which I consider might be fairly described or shown on the drawings, I find it gets reduced to 32 pages, which includes some four or five pages for provisional sums and other items for which drawings would not be given. The reduced specification which I suggest would be practically a stock document, requiring little if any alteration, except as regards provisional sums, and any alteration it did require would be so slight that an hour would be sufficient to make the alteration. I think this would be a considerable advantage, and the saving of time would be considerable also. Given a good workable set of drawings, fully noted, with several sections and elevations, and a concise description or specification of the materials to be used in place of the present lengthy one, and I believe good work and little friction would result. Engineers, to a very large extent, adopt this system with their work, and I have never heard that it suffers, or that it increases their labour. The third division of my paper will probably meet with some opposition, for I propose in this to abolish the

specification entirely when bills of quantities are supplied, and utilise them in its place. I say that I expect some opposition to this proposal, because I know that there are some difficulties in the way, not the least being that employers know of the specification, and usually expect to see it, whereas bills of quantities to them are unknown. Then again public bodies, such as the Charity Commissioners, require to have the specification submitted to them with the drawings. But these difficulties could probably be overcome by a modified specification such as I suggested just now. Some architects also do not avail themselves of quantities in obtaining tenders, and to these of course the suggestion would not appeal—others again do not have quantities but have the work measured up at the end. In either case some form of specification would still be required. But as regards difficulties in combining the bills of quantities and the specification I may point out that in Scotland the specification, apart from the bills of quantities, is almost unknown—and, as far as I know, and my experience on this point is not entirely theoretic, no inconvenience is experienced. Of course usage is, and always has been, a great bar to improvements or alterations of any kind, and the natural conservatism of human nature is not weaker in professional circles than in others, perhaps stronger.

I can imagine some architects objecting to the change because it would give too great a prominence to the quantities, and that it would necessarily result in the quantities becoming a part of the contract. Why they should not be I can never understand; the employer pays for them, and they are generally used for the purpose of settling up accounts. The clerks of works refer to the quantities as much as to the specification when they are allowed a copy; but, of course, as they are merely statements of fact and not descriptive, they are not so useful for reference as they might be. I know there are many surveyors who would strongly object to the change, as they hold the view that the quantities are only for the purpose of assisting the builder to make his tender; but I combat this theory, for in the bills we have a perfect specification if only descriptions indicating their destination in the work were appended, and if it is possible to use them as a specification it would tend probably to economy. It is perfectly true also that to one unacquainted with the arrangement of a bill it is a complex medley of figures and descriptions; but this is caused very much by the trade system, as in the specifications being rigidly adhered to, and, I am afraid, by a little perversity on the part of some surveyors to increase rather than reduce the complexity. Well, all this would disappear if the specification and bills of quantities were merged in one; we should then have the quantities as a rigid statement of facts, with the requisite descriptions of the specification. As I said before, the Scotch schedule of quantities is specification and schedule, and where we have in England references by the builder to what the specification says, in Scotland he refers to what the schedule states. What is possible there should be so here.

Surveyors ought not to object to the proposal, but ought to welcome it, as their work would be brought into greater prominence and into a wider sphere of usefulness than it is at present. For the architect would have it at hand for constant reference to settle points in connection with the details; the clerk of works and foreman would also use it, and many extras which are now incurred in ignorance, through the bills of quantities being sealed to them, would be avoided. A certain class of surveyors, I can understand, who would object to the change, viz. those who prepare bills of quantities for ridiculously low commission, and to protect themselves against possible errors "amplify" their quantities. To those who add a few rods of brickwork to cover the lack of proper details, or increase the stonework to cover other things, a combined bill and specification would not be acceptable, for the essence of the document would be in its exactness in all parts. I am sure respectable builders do not care for this haphazard quantity system, although it frequently gives them more of one thing than they are entitled to; what they require is that a bill of quantities shall be a fair representation of the work in the building. I am prepared to admit that the bills of quantities might be rather longer, that is to say, they would be as at present, plus the necessary detailed description of positions in the building; but a saving would be effected in the printing or copying of the specifications and the extra time spent on the bills would be saved in the time usually spent in writing the specification. I do not wish it to be understood that this method would do away with the necessity for detail descriptions on the drawings, but I do believe it would relieve many architects who dislike specification writing from a labour which is irksome to them. How the bills of quantities can be made to answer both purposes I need hardly suggest to those here who do such work; it is a matter of small technical details, and would simply necessitate a careful arrangement of the items, so that each would state its location in the building. Generally I may say that I should group the items together, so that you could, by the quantity given and the description, see at once where the work was intended to go. It would be

impossible for me to give every detail this evening, but I have, I hope, given you enough to grasp my suggestions. The proposal of adopting a shortened specification is one worth considering, but the latter I consider the most important and also one which, I believe, will be the system adopted in the future.

Whether I have justified the title of the paper I leave you to judge; at any rate, I have had the architect's view in mind all through, and although I have advised more work on the drawings, I have by suggestions reduced the specification writing to a very small part of your work, and also have ventured to suggest the total abolition of a document loved by neither architects nor surveyors.

Mr. A. HOLLOWAY read the following paper on

Specifications from a Builder's Point of View.

The subject of this paper was suggested to me by your hon. secretaries, and at their request I have prepared a few remarks on specifications from a builder's point of view, but at the same time I have endeavoured to avoid airing any personal grievances or propounding any special fads and crotchets of my own.

I have great pleasure in being here to-night to discuss such an interesting subject, especially as I have the satisfaction of meeting my friend Mr. Pink in friendly contention, to discuss the matter from two opposite points of view. If there are any hints I may venture to offer, I trust that they may be taken as offered as such, and not in any way condemning architects' specifications or of taking upon myself the position of instructor or censor to architects in regard to this very important part of their professional work. You will not, therefore, expect from me a full and comprehensive specification embracing all subjects, nor any proposals for revolutionising its form and purposes, but rather the terms on which the general idea of a specification should be based, with the hope that it may tend to prevent difficulties and misunderstandings between the architect and the builder.

I should like to take the opportunity of bearing my testimony to the manner in which, taken as a whole, the architects discharge their most difficult and onerous task of dealing with fairness and justice to the contractor, while at the same time acting with loyalty towards their client. During the many years my firm have been in business we have experienced but two or three instances where there has been a grievance against the architect, and although we wisely insist upon the arbitration clause in the conditions of contract, we have never yet availed ourselves of its provisions, neither have we had recourse to a court of law, excepting in one instance, and even in that case it was no reflection against the architect, as the point at stake was entirely a question of prices, upon which he had been badly advised by the quantity surveyor.

My first suggestion may appear trivial, but from a builder's point of view it is of some importance, namely, the form and arrangement of the specification should be in the simplest language, carefully prepared and legibly written, also set out in clauses and under proper headings, with margin or heading notes, each paragraph being indexed. Remember, it is always essential that the architect's copy should be on the job. The general foreman is not often blessed with a college education. Don't send the specification copied on tissue or letter-pressed copying paper, which is in shreds before it has been on the job a month. In these days of cheap and expeditious printing I venture to urge that printed or lithographed copies be supplied.

The conditions of contract should be attached to and form part of the specification. It is not necessary to discuss the form of these conditions, as I presume all architects will loyally adopt that agreed to between the architects and builders' institutes.

The quantities should be in conformity with the specification, consequently the draft specification should be in the hands of the quantity surveyor before he proceeds with his work, but a little latitude might with advantage be given to the surveyor to vary or add to in minor points, in order to bring the drawings, specification and the quantities in perfect line with each other.

The practice of specifying sub-contractors and specialists is increasingly resorted to, in some cases almost to the extent of having separate firms for the principal trades. Architects who have had works in the North of England, and adopted the system of employing a separate firm for each trade, know something of the inconveniences of this course of procedure. The practice, generally speaking, increases the cost, causes delay in execution, and creates a considerable amount of friction between all concerned. In cases of special works for which special men are required, such as are not usually engaged by the builder, or in the fixing and arrangement of patented goods which the patentees have to guarantee the efficient working and durability of, it may be desirable to provide for the sub-contractor to completely finish his work. But this custom should be minimised as much as possible, so as to give the builder entire and complete control over the whole of the building in course of erection, as he has to be responsible for

everything. In all cases where sub-contractors are engaged by architects there should be an undertaking from the sub-contractor to comply with the conditions of the builder's contract as far as the same are applicable to his work. Unpleasantnesses frequently occur between the builder and sub-contractors through the omission of the architect insisting upon this point. It is urged by architects that this is a matter between the builder and the sub-contractor, but it is obviously more desirable, and only just to the sub-contractor, that this condition should be agreed upon when the latter prepares his estimate.

Probably the bulk of the builder's difficulties arise from a want of definiteness in the description of the architect's requirements. General "covering" clauses in specifications are much too frequent. If the architect has a difficulty in regard to his working drawings, or in connection with the site of the proposed building, and is unable to specify precisely what has to be done, he has recourse to his familiar "friend" (the covering clause), and throws all responsibility upon the unfortunate builder. Here is an extract from a specification as a sample of what I mean.

"Do all necessary cutting and making good. Supply all materials and workmanship necessary, although not herein specified, to render the whole of this branch of the trade perfect and complete to the entire satisfaction of the architect."

The same clause, with a little variation, appears after each trade.

Such conditions as these have only to be exposed to be condemned by reasonable men, but unfortunately they appear only too frequently in specifications. In cases where it is impossible for the architect to specify clearly and in detail, and for the quantity surveyor to measure, the work to be executed, the proper and just course to adopt, both to the client and the builder, is to provide an amount to be used under the architect's directions, and the work paid for either by valuation after completion or charged for as day work. There is frequently much indefiniteness in the specification with regard to foundations. The builder has to take many risks for which he has very little opportunity of forming any idea as to whether it will involve an expenditure of 5*l.* or 500*l.* My firm recently tendered for a building where it was impossible to judge of the character of the subsoil to settle the depths of the foundation, consequently a schedule of prices for extra depth of digging and concrete had to accompany the tenders.

The prices for the extra digging varied from 18*s.* to 6*s.* per yard cubical. The firms tendering were a selected list, and all well-known responsible people. This difficult and unfair position can be easily removed by the architect obtaining the particulars of the soil by means of trial borings, which can be done at a trifling cost.

There should be always a practical reason for what is specified, and nothing should be specified unless the architect thinks it absolutely necessary to carry into actual execution. Also care should be taken not to specify what is a practical impossibility.

The following are a few specimens taken from specifications to illustrate my point, viz.:—"The excavation to the trenches is to be taken down to a perfectly solid bottom, and the bottom well rammed." One naturally asks, why ram when you have a natural solid bottom? Is it not possible that if ramming is enforced you will not have a good solid bottom? Supposing the foreman carries out the specification, digs the trench to the depth shown in drawings, and has the bottom well rammed for the architect's inspection, it is possible the architect may be deceived by the sound appearance of the bottom and have the concrete put in upon what is anything but a natural sound foundation.

"The concrete in trenches to be well rammed." The absurdity of this description is obvious. To ram concrete immediately it is thrown into the trench in a soft condition is quite useless and a waste of labour, and if rammed after it has commenced to set it would only tend to prevent its adhesion.

"The stock bricks are to be hard, well burnt, perfectly square and of uniform colour." It is only necessary to visit a brickfield and see the making of stock bricks to know the impracticability of this description. The description is quite contradictory to the nature of stock bricks, which are burnt in large stacks, or clamps, of about half a million each, with fuel sprinkled between to help the firing. The bricks that get the strongest heat will be the hardest, and as a matter of course to an extent flared and varied in colour. The weight of such a large quantity stacked together before being burnt must of necessity press the bricks somewhat out of square. The beauty of stock-brick facing to my mind is the slight variation of colour.

"The mortar to be composed of one portion greystone lime to two portions of clean sharp sand." Either the proportion specified is not expected by the architect or he must be ignorant of the proper proportions of lime and sand for good mortar. There is no strength in the lime of itself. The proportion of one of lime to four of good clean sand makes the best mortar.

Particular quarries for stone are frequently specified (especially Yorkshire stone) which have been worked out for several years. It is desirable as far as possible to avoid the mention of particular quarries unless the clause is modified by the addition of the following:—

"Or stone from some other quarry equal in quality to that specified."

Perhaps the most difficult part of an architect's specification is that in reference to timber, and the builder finds it more trouble than all the other kinds of material combined. The architect generally makes certain ground for himself by specifying that it is to be "perfectly free from sap, large knots, shakes and all other defects." Such a description is very admirable if the material can be so supplied, but it is perfectly well-known that this degree of excellency cannot be maintained, hence the difficulty of interpreting to what extent sap, knots and shakes will be tolerated. Unfortunately the opinion of clerks of works (to whom this is usually referred) varies very considerably according to their knowledge or other contingent circumstances. It is a mistake to suppose that because there is a slight discolouration on the edge of the timber it is unfit for use. Care should be taken to see that no sappy wood is built into a wall or fixed in a confined position where there is no air space; but for open roofs, floor-joists and such like the timber will not rot or become weakened because of a little blue sap, which is frequently only surface deep. I have been asked by architects to suggest a suitable and reasonable description for timber and joiners' deals, but have always found it a difficult task to do so. Specifying by means of names of ports and brands is unreliable, as the goods scarcely ever maintain the same quality for two or three seasons together. For a few years a splendid quality of joiners' deals had been imported from the Archangel port, but last year it was much below the average, and a large proportion of it quite unfit for good class joiners' work. With considerable diffidence I venture therefore to suggest the following as a reasonable description for timber and joinery deals, viz.:—

For the Best Class of Work.—"The Memel or Dantzie timber of the best-selected middling quality."

For Ordinary Class of Work.—"The Memel or Dantzie timber of the good middling quality, or (where scantlings under 11 inches wide and 4 inches thick) from sawn scantlings of an approved Swedish or Russian port, not inferior to a recognised good fourth quality Swedish brand or third quality Russian hammer brand."

"All timber to be free from large and loose knots and shakes, also practically free from sap to the architect's approval."

For Joiners' Deals.—"Good quality from approved Swedish or Russian ports, free from large and dead knots, shakes and sap. Not inferior to a recognised first and second quality Swedish brand or second quality Russian hammer brand."

Pitch pine and Oregon pine are much used for timberwork, also yellow pine for cabinetwork, but neither of these American woods are suitable for positions exposed to weather and damp. But for interior work it is much cleaner in appearance than the Swedish and Russian goods.

A point requiring the special consideration of an architect in preparing his specification is that of fixing the time to be allowed for the execution of the work, particular regard being given to the period of the year at which the building is to be completed. It frequently happens that a job, say of a new house, or an addition to a house to the value of 2,000*l.* to 3,000*l.* containing a quantity of good joiners' work is commenced in July or August, and has to be completed by the Christmas following. The specification insists that the joinery work must be of thoroughly seasoned wood, roughly framed together, and put into drying-room within a month after signing the contract. (By-the-by, notwithstanding the stipulations, it too frequently happens that the details are not supplied until after the roof is on.) A moment's thought must satisfy anyone with practical knowledge that to put good seasoned joinery into a building erected under such conditions simply means ruination to the work, and ultimately serious trouble and expense in easing doors and windows, stopping open joints, touching up shrinkages, &c. Moreover, the builder is condemned for supplying inferior material. In all cases where good plastering and joinery is required, architects should make arrangements to avoid either of the same being proceeded with to any great extent during the winter months.

In conclusion, I would urge that in order to avoid friction, disputes and to secure good work, there must be mutual confidence between the architect and builder. To secure this the architect should only invite to tender (where competition is required) those with whom he can take counsel and place confidence. There is far too much suspicion, especially on the part of the younger members of the profession. I do not deny there may have been reasons for it, but, speaking generally, builders have a regard for their reputation. They know that one act of rascality exposed means ultimate ostracism. On the other hand, a good sound building is a standing advertisement.

Many little misunderstandings and difficulties would be obviated if there was more personal intercourse between architect and builder, especially upon the building. This course has been adopted with most of the architects with whom my firm have done business for any length of time. With these gentlemen we have never experienced the slightest trouble in complying with their requirements and giving every satisfaction.

The lot of a builder in these times of keen competition, unreasonable demands on the part of workmen, fluctuations of trade, losses by stress of weather and the exceptional worry arising from what is probably the most uncertain and risky commercial undertaking in the country, is by no means an enviable one. I therefore appeal to you to have some regard to the peculiar difficulties with which the builders have to contend, and urge you to do your part in promoting a good understanding and mutual confidence between the profession and the trade. I can assure you on behalf of those whom I have the honour to represent that such good feeling and confidence will be heartily appreciated and reciprocated.

On the conclusion of the paper several members joined in the discussion, viz. Messrs. Fleetwood, E. Woodthorpe, Francis Hooper, H. Pratt, Brodie, Stockdale, Max Clark, and Lough (Simpson & Co.).

A vote of thanks was passed to the two gentlemen for their papers, which Mr. Holloway acknowledged, and the meeting terminated.

CARPET DESIGNING.*

THE questions, what are legitimate subjects for carpet designs, and within what limits is the right treatment of those subjects to be confined, are not easy to answer. Let us first consider why a carpet exists at all, and next, how it is used. In this country, at all events, it exists first for the sake of warmth, next for noiselessness, and lastly for comfort and ease apart from warmth. For all these ends it is desirable that it should be moderately soft; and though we should not be led away by a mere play upon words, there is, I think, sufficient relationship between softness to the touch and softness to the eye in form and colour to justify us in laying down the rule that a fabric which necessarily has this quality in its first sense should, by its treatment, suggest it in the other two. I know that many fine Eastern carpets directly violate this rule as regards form. They are often extremely harsh and angular in design, but this is amply atoned for by their colour, which in the best examples, however strong the contrasts may be, is always mellow and soft. And the angular geometrical designs are successful, not because they are angular, but in spite of their being so. This is very well seen in the magnificent work on Eastern carpets lately published in Vienna, where nearly all the specimens are represented twice; in black and white, and in something like their original colours. Some, as shown in monochrome, are absolutely uninteresting, while others are in that form even more beautiful and suggestive to the designer, and, paradoxical as it may seem to the colourist, than in the polychrome versions which purport to be faithful reproductions of the originals.

In the next place, as a floor is flat the decoration of its covering should be the same. It may seem strange that a carpet manufacturer should gravely enunciate a counsel of perfection of this kind, seeing that the bulk of the designs produced in this country do not comply with it. I need not repeat what I said in this place last year in explanation of the difficulties in which manufacturers find themselves owing to the necessity of producing what the trade and the public demand, and I only refer to it now to anticipate a possible charge of inconsistency between doctrine and practice. I must, however, refer to a particular class of cases in which we find ourselves in a difficult position if we are to insist on flatness as essential. I mean those in which carpets have to be made to suit rooms decorated in any of the French styles, say from Louis XV. to the Empire. It is expected that the style of the carpet shall correspond with that of the walls and ceiling, and as the characteristic features of the Louis XVI. style, for instance, are certain mouldings, scrolls, festoons and so on, these have also to appear in the carpet. They can only be adequately represented by shading and so flatness at once disappears, in addition to which we have the absurdity of hanging festoons, &c., on a horizontal surface.

Now in every respect, except in the all-important matter of flatness, such carpets answer their purpose admirably. I conceive that the ideal carpet for a Louis XV. or XVI. room with light walls is one with a simple design in monochrome the filling, composed of two or three shades of a solid colour. It should be fairly dark for reasons of practical utility, and also because it gives a sense of solidity under foot and acts as a foil and contrast to the walls. The border should, it seems to me, be treated as a connecting link between the walls and the mass

of the carpet. It should, therefore, be somewhat light, and should unite within itself the colours of walls and floor, so that the eye may be led from one to the other without any unpleasant break. Now the method of shading lends itself admirably to all this. It enables us to get a filling which, though not absolutely flat in detail, has on the whole a level effect, and it is most admirably suited for the introduction of colour into the border. I have pondered much on the problem how to introduce rich colour into the border of such a carpet, preserving perfect flatness, and at the same time retaining the characteristic features of the style, but can find no solution. It is easy enough to keep the filling flat by the simple expedient of using two shades only, but this to many eyes is tame and meagre, and it is less serviceable in wear than one with a number of tints. While I condemn shading I have strong sympathy with the feeling that underlies the craving for it, viz. the desire for gradation in colour. A clear sunset sky is more pleasing than the uniform blue of mid-day, the myriad delicate tints of a tea-rose delight us more than the flat expanse of a camellia, and a piece of silk or velvet becomes much more beautiful when it is broken up into folds. In all these cases it is gradation that makes the difference. Now in other styles, notably in Persian ornament, it is very easy to combine gradation with flatness, but in the French styles it is almost impossible. If a very bold simple scroll be used as a filling streaking may be tried, as in Persian work, but if this be done without an outline the design, so to speak, falls to pieces, and an outline gives a most objectionable hardness to a damask of this kind. If flatness be absolutely insisted on, there seems to be nothing for it but to put up with a filling in two shades, and as a border of the usual type would look intolerably bald and meagre if treated in the same way, I think the best plan is to reduce it to its simplest elements, and let it consist simply of a few well-proportioned bands with a broad, plain margin. This, of course, gives up the idea of making the border a link between floor and walls, but I can see no other way out of the difficulty. Some decorators evade it by using plain carpets, a solution more satisfactory to the manufacturer, as such, than to the designer. Possibly the Gordian knot may be cut in a different way. There are signs of a reaction against the French styles of decoration in favour of modern original English work. Already, both in Germany and France, the latter is rapidly making its mark, and I am glad to say that some of our leading dealers, who are also decorators, are using all their great influence in favour of purely English work.

It will be gathered from the foregoing that I have nothing whatever to say in defence of florid designs in French and other imitative styles, so far as their drawing is concerned, though their colour schemes are often very fine, much of their beauty arising from the opportunities they offer for gradation.

Here let me interpose a suggestion that the use of simpler borders would in many cases be an improvement. Mr. William Morris is reported to have said, "The smaller the room the bigger the wall-paper." In a similar spirit of paradox I am disposed sometimes to say, the bolder the filling the simpler should be the border.

In my last paper I referred to the introduction of graded and broken tints into English reproductions of Eastern carpets as a decided advance in colouring. Here I find myself apparently at variance with Mr. Aymer Vallance, who has said that "contrasted colours are rather to be preferred than subtle gradations of hue, which are apt to give the appearance of shading and relief, a thing always to be avoided in a flat surface. A bold and clearly-defined outline is desirable, and large patterns rather than small."

I am not quite clear to what Mr. Vallance refers. If he has in his mind those subtle gradations which are not only "apt to," but are deliberately intended to give the appearance of shading and relief, I heartily agree with him; but his words as they stand have a wider range than this, and I wish to point out that, as some of the examples before you will show, gradation by no means necessarily involves the suggestion of relief, and moreover that a mass of colour may have subtle gradation within itself, and yet be at the same time in sufficiently strong contrast to adjoining masses. So that the two methods of treatment which Mr. Vallance regards as opposed to one another may be combined with good effect.

I quite agree with him in condemning the imitation of errors and irregularities in Eastern carpets when this is done in an obtrusive way. It is unpleasant to see the same mistake occurring with mechanical regularity every yard or so. But I defend the practice, not of copying mistakes, but of learning wherein the charm of such irregularities consists, and of applying the method in an unobtrusive way, so that the eye is pleased by variety and not offended by repetition.

Much might be written regarding Mr. Vallance's dictum on the use of a bold outline. I will only say that in practice many cases occur where the use of an outline is out of the question. His remark that "large patterns are more desirable than small" appears to be more an indication of personal preference than a statement which has any authority to support it. If all

* From the paper on Practical Carpet Designing, by Mr. Alexander Miller, read at a meeting of the Applied Art Section of the Society of Arts.

patterns are to be large, what are we to do in the case of small irregular rooms, landings and so forth? This appears to me to be one of those cases where theory is apt to run wild for want of correction by practical work-a-day experience.

In selecting subjects for carpet designs I suppose it will be generally agreed, whatever opinions may be held as to the desirability of copying and reproducing the work of the great ancient designers, that we cannot possibly do better than to study their choice of subjects and their method of treatment, and to follow them in both respects so far as we find they have been successful.

Now in their choice of subjects we find that practically they have taken all nature to be their province. Their designs range from the simplest geometrical arrangements of knots up to ambitious representations of hunting scenes, and so forth. And we find that in many cases they are, up to the measure of their powers, frankly pictorial. It is not uncommon to see the same class of subjects treated in much the same way in illuminated manuscripts, in painted lacquer-work and in carpets. It will scarcely be contended that in choosing such subjects as cheetahs chasing antelopes they display that unerring artistic judgment with which they are usually credited. But their genius is shown by the triumphant way in which they have treated subjects apparently so unsuitable for the floor, and have brought out their decorative possibilities. The same may be said of their treatment of trees when there is an evident attempt to treat them in a naturalistic manner.

I cannot admit that they have never transgressed the bounds of what is permissible in subject, for they sometimes err egregiously. I cannot, for instance, imagine anything more atrocious than the two lamps hanging in opposite directions which disfigure the Holy carpet at South Kensington. True they are highly conventionalised, but the motive is unmistakable.

In analysing even their most pictorial method we find that in the drawing there is the most absolute flatness. A spray or tree is laid out very much as one has seen seaweed spread upon paper. There is no foreshortening, stems rarely cross each other and are rarely broken by leaves or flowers, but are frankly displayed and often form a distinctive feature of the design. It has been said by a critic for whose opinion I have a high respect, Mr. Hugh Stannus, that in a carpet "the design should be of mass rather than line, and of leaves and flowers rather than stems," and while I quite agree with this as a general rule, as tending to give softness and repose, I think the success with which this rule has been disregarded in many fine Persian carpets shows that it is by no means without exceptions.

Here I wish to call your attention to three objects; first, a fragment, as its appearance indicates, of a very old Persian carpet, probably dating from the sixteenth century; next, a modern design, founded on English wild flowers, in which there is an attempt to treat them in the Oriental fashion, and, thirdly, a modern Oriental carpet, in which much the same idea is carried out. The latter is possibly a copy from some ancient original, but I have not been able to trace it. I may say that the second design, suggested by the old fragment, was made long before I saw the third, and, whatever may be thought of it, it will, at least, be recognised as an attempt to apply Oriental principles without copying Oriental forms.

I have tried, partly by way of a joke and partly to show how right treatment may bring the most unlikely subjects within the range of what is permissible for carpets, to treat one or two pictorial subjects as we may conceive their being treated by a Persian designer. Of course I do not offer these as serious attempts at floor decoration, but I think they show that the range of possible subjects is wider than is generally supposed.

One thing I think the Persian designers have clearly shown, that in adapting natural forms we need not confine ourselves to those which are usually seen, so to speak, in plan. Some authorities have gone so far as to lay down the rule that only those plants which naturally assume a radiating form when seen from above, such as the daisy, the dandelion, &c., are suitable for floor decoration, that in fact only those plants which are found in the carpets supplied by nature are to find a place in those produced by art. This doctrine was very fascinating when first promulgated, and it is not easy to show that it is theoretically unsound. But in practice it has a terribly cramping and limiting effect, and it is refreshing to find that in the great masterpieces it is wholly disregarded.

One of the most beautiful types of the Oriental carpet is that in which the whole design consists of one panel with a border, centre medallion and corner-pieces, the ground being sometimes plain and sometimes filled with ornament, as in the Holy carpet, which is an excellent example of the type referred to. To my great regret I have to say that carpets designed on this plan find very little favour with the public at the present time. It may be remembered that I showed one last year, and considerable surprise was expressed when I said it was not a commercial success. The reason given me by a competent authority is that since the advent of the electric light centre ceiling ornaments are no longer used, and carpets have followed

suit. Intending designers should, therefore, avoid this plan, tempting though it be.

Here I wish to point out that plagiarism of a legitimate kind seems to have been not unknown among ancient Persian designers. There is no other possible explanation of the fact that we find precisely the same motives as to general plan and details of ornament in leather book covers and in carpets, so much so that it is sometimes difficult in a photograph to tell at a glance from which of these two sources it was taken. It is certain that either carpets were founded upon bookbindings, or bindings upon carpets, or that both were taken from some common source, probably architectural, the last supposition being the most likely one. I have known English designers to be convicted of copying on the strength of a much slighter resemblance than that which exists between these two classes of work. But whatever the explanation be, does anyone regret that the copying took place? Is not the world the richer for it? If the carpet man copied from the book did he not put into the design that glorious colour in which the greater part of its merit consists and to that extent produce something new and beautiful? And are not the endless variations which have been played on this same theme each of them more beautiful things than those which would have been produced by the same designers, if each of them had attempted to create a new type? Here is abundant justification, if any be needed, for the practice I adopt and recommend of going to ancient examples of other fabrics for ideas, both of form and colour. If one does not merely copy slavishly, but puts something of one's own into the design, one has acted on the lines on which all the great decorative work in the world has been produced. And when I say "something of one's own," I do not necessarily mean an absolutely new conception. (I very much question if any such thing exists, but I must not stray into metaphysics.) If a designer takes a subject from one source, a method of treatment from another and a scheme of colour from a third, and combines them into a harmonious whole, he has made something new under the sun and probably something very much better than anyone could have produced entirely by his own inventive powers, great geniuses always excepted. The faculty of combining two or more apparently unrelated ideas and of evolving from them something which is not a mere piece of patchwork, but has an organic unity of its own is, I hold, distinctly creative in character. As Mr. Gleeson White has happily said, "Adaptation is the true originality."

It is odd that the manufacturer is never blamed for taking his colour wherever he can find it. And yet it is by far the most important element in a carpet. Why, then, should he be permitted to borrow and adapt his colour, while he is blamed for doing likewise with his forms? The only answer I can find is that those who blame him do not sufficiently realise the enormous importance of colour in relation to carpets.

Suppose the Persian designer had the suggestion made to him by a friend, "There's a nice book cover; wouldn't it make a capital carpet." If he had indignantly repudiated the idea, and insisted on being absolutely original, his work would not have been what it is. Those who think otherwise should be able to point to some absolutely new piece of ornament the parentage of which cannot be traced to some pre-existing form, a somewhat difficult task.

Let me not be understood as advocating the practice of borrowing from contemporaries, though few can avoid being at least influenced by them. But sometimes in this respect a manufacturer may be blamed without cause. A designer sometimes carries out the same idea for makers of two different fabrics, with the full knowledge and concurrence of both. For instance, I show you Mr. Arthur Silver's "Sea of Flowers" cretonne, and the same idea carried out in a carpet. It is about as unsuitable for the latter purpose as a design can well be, but Mr. Silver is not responsible for suggesting the misuse of his charming conception, which was adapted by him for a carpet to meet the taste of a foreign market.

I am sorry to say, also, that the practice of selling the same design to two manufacturers, without the knowledge of either, is not unknown, though it is more common among French designers than in this country.

Hints to Beginners.

Let me now say a few words to guide the beginner in the actual making of a carpet design. He will, of course, first decide on a particular fabric, and keep his attention closely fixed on the conditions which apply to that alone. In most cases I think the easiest plan is to make a sketch quarter full size, but if the designer finds in himself a tendency to over-elaborate his details, a still smaller scale should be adopted. A small sketch offers facilities for the necessary copying out and laying together of several repeats, and its adoption will avoid what will seem to many the drudgery of working on ruled paper, but, nevertheless, a portion at least of every design should be carried out in full-size on the special paper adapted for the fabric in view. The enlarging process is much simplified by the division of all ruled papers into squares by

heavy lines. To enlarge it is only necessary to make a tracing of the small sketch, divide it into corresponding small squares, and proceed in the usual way. This is the only way to see what is practicable, and to avoid multiplication of details, which is the fault to which most beginners are liable. Care should be taken not to run into the opposite extreme, which involves unnecessary clumsiness of drawing. When the designer has acquired the knack of making a small sketch or "model," as it is called, which contains nothing which cannot be satisfactorily put on lines, he need trouble himself no more with ruled paper. The great mass of the French designs, which are so thoroughly practical, are made quarter full size on plain paper. I cannot but think that the facility thus offered may attract artists who are now repelled by what to them is the tedious, irksome process of putting on lines.

Ordinary water-colours should not be used except for a rough preliminary sketch in which the scheme of colour may be arranged. Body-colour, that is, powder or distemper colours ground up with gum or size, is the only satisfactory medium for carpet designs. I have heard of a case in which an art teacher insisted on his pupils using water-colours mixed with white, but this method is quite unsuitable. It is absolutely necessary in a carpet design that every tint should be perfectly solid, level and distinct. There must be no unevenness and no insensible gradation between one colour and another. It should never be forgotten that each tint used has to be translated into a separate shade of yarn, and the design should be such that it is possible to count without doubt or hesitation the number of distinct tints employed. Every mass of colour, whether it be a large space of ground or a tiny dot, must be sharp and well-defined, as much so as if it were cut out of coloured paper and laid on, but of course this by no means implies that there may not be very soft gradation produced by a series of tints.

If an outline be used, it must be remembered that on the ruled paper its minimum width is fixed by the size of the "points." In a Brussels it cannot be less than one-ninth of an inch, and in Axminster it will be still broader; therefore great care should be taken to obliterate all pencil lines lest, if they be allowed to show, a mistaken idea be formed of the way in which one colour tells against another. If designs with light and shade be attempted, the methods of French designers should be closely followed, as they have a marvellous knack of getting effects of this kind in body colour and of indicating the modelling of a scroll or a flower by a few bold simple touches, which is exactly what is wanted for a carpet. In work for coarse fabrics harsh contrasts should be avoided. Much can be done to decrease coarseness of effect by soft gradation of colour, a point which Mr. Aymer Vallance has probably not considered.

As to the size and arrangement of designs for tapestry, Brussels and Axminster woven in breadths, it may be noted that fillings are invariably made 27 inches wide. There is no fixed limit for the length of the repeat, but it should be as short as is compatible with the avoidance of striping. In Kidderminster carpets fillings are made a yard wide, there are generally two repeats of the pattern in the width and 2 feet is the usual length for the repeat. In Brussels and Axminster the pattern should invariably be what is known as a "drop," but in Kidders it should be what is called a lift over or self match. In borders the repeat need not be the same as that of the fillings in length; 18 and 22½ inches are the usual widths.

In planning a design the artist should try to form a mental picture of what the effect will be when a large number of repeats are seen in diminishing perspective. Balance and distribution should be carefully studied, long straggling lines and angular forms should be avoided and stems should be broken and disguised by leading other stems in an opposite direction, or by throwing a spray of flowers across them. As a rule bilateral symmetry should be avoided. It frequently leads to great practical difficulties, as when narrow irregular corridors have to be arranged for. It will be found that a carpet which has a great deal of intricacy and mystery is more pleasing than one of which the whole scheme can be seen at a glance. In the drawing of the design this quality can be obtained by the use of a complex system of stem-work, not by any means necessarily an obtrusive structure, but one which will carry the eye hither and thither, and will not yield up the whole secret of its construction at the first glance. It can also be obtained by adroit management of colour, for instance by the use of different ground shades, that which forms the ground in one part becoming the figure in another, and so on; in fact there is no end to the complicated arrangements which are possible. A study of everyday commercial designs is the best means of mastering these. Whatever their artistic faults may be, some of them are marvels of ingenuity in this and other respects.

I can quite understand the feeling of repulsion with which our leading designers turn away from them, but I venture to suggest that they are sometimes worth study for their technical qualities, their arrangement, the way in which difficulties of drawing are got over.

MODERN ENGLISH PAINTING.

THE Spring Exhibition of the Royal Birmingham Society was inaugurated with an address by Mr. Harry Quilter. He said that he had been looking through the catalogue of the permanent collection of pictures at the Art Gallery, and it seemed to him that Birmingham had the best selection of pictures that he ever came across. Speaking generally, he did not think he could say as much, judging from the pictures that were illustrated, of any other town in England that he had been in. It was a very good thing not only to have fine things, but no rubbish. He then referred to some of the special characteristics of the exhibition—the collection of sketches and pictures by Pinwell and Mason—and pointed out that the poetic quality of Mason's work came about in a curious way. Mason painted for eight or ten years before he did anything worth looking at. By the mercy of God he lost all his money, and he was actually starving, when Costa took him into his study in Rome, gave him work, set him on his legs, and taught him his art. If they had ever seen Costa's work they would know whence Mason got the charm of his pictures. As to Pinwell, he (Mr. Quilter) had for the last nineteen years been the only man in England who had persistently written up that artist. He did not see how anyone could look on Pinwell's works without seeing that they were the productions of a man of great imagination, as well as of great technical power. Passing over the peculiarities of Pinwell's art, which he had dealt with in the catalogue that the Society had asked him to prepare, he said that during the last thirty years, roughly speaking, English art had gone through a large number of changes, and those changes had been so radical and, in his opinion, so unfortunate, that they had left English art in a state which he had hardly any words to describe. It was neither fish, flesh, fowl, nor good red herring. It was not English, French, or Italian; it did not belong to any special nationality, but it appeared to be swimming about here and there with a sort of vague desire to catch hold of something. Here it was impressionism, there it was colour, here again it was study in light and shade, and there a study of some ideal subject, such as the evening coming in at the window and finding a young girl dying over her sewing-machine. What they liked to do in the way of painting in the old days they did not like to do to-day. If they did like to do it they were told that they ought not to like. As a rule, being men not very much given to controversy, they held their tongues and did their work as well as they could. But the clique who were most vocal nowadays in the newspapers and clubs and societies were only great at one thing, and that was that they would not have old English art. Here was a strange state of things—on the one hand the experts declaring that old English landscape was conventional, false, ugly, untrue, and had every demerit one could possibly attribute to it; and, on the other hand, the men who ought to be the best judges of what was good, because they had their living to get by selling what was good work—the dealers—were paying increasing sums of money for these very same pictures. Were the people such silly idiots that they were going to increase their prices for what they did not care about? Why on earth should people try to paint France in England? When Englishmen painted France they did not do it at all well, because, being Englishmen, they painted it in a half-hearted manner. He was anxious not to run this art too hard, but he wanted them, as citizens who could exercise an appreciable influence on art, to think the matter out for themselves, and their duty was primarily to English artists. Therefore, even at the risk of being a little hard and discouraging, and perhaps causing pain to young students who had spent six weeks at the Beaux-Arts with the greatest satisfaction to themselves and their friends, who had learnt a flip-flap style of painting—even at the risk of discouraging young students, he asked his friends to press forward to establish English art in the counties of England if they could not do it in the Metropolis. It appeared to him that the Metropolis was too strong for them at the present time. They were collaring the Royal Academy, a thing he thought he should never live to see. There were hopeful signs, all the same, that this new expression of feeling was not going to last. He did not wish it to be understood that he was desirous of confining English art to one kind. He should like Englishmen to paint as many kinds and as many subjects as they liked, and in their own way; all he wished them to do was not to imitate the Frenchman. He did not want them to imitate anybody. What was nice about a picture was the expression of the artist's personality, and one could not express another man's personality, however much he tried. He could express an outside sense, a superficial resemblance; but what made a good picture beautiful was the thought that had been put into it by the artist himself, by his personal equation, if he might call it so. To imitate the personal equation of a nation was just as doomed to disaster as to imitate the personal equation of a man. He did not wish to draw the line at subjects which

in Miss Pinkerton's academy would be considered improper. If their artists wished to be improper, let them, but in an English way. The people were responsible for the art of the country. The artist would paint exactly what the people required. Let the artist see when he painted a trivial subject that did not please, and when he painted a subject in which he put all his art and mind let him see that he did please, even if he did not always rise to the height of the subject. To have a fine subject worthily treated made a finer picture than to have a trivial subject worthily treated. After all, art was a part of life. They might look at it from the side of commerce or from the side of art or literature. Their love to be worth anything must be made up in proportionate quantities of the various energies of mankind. Art should be a reflection of their lives, but not a reflection of the basest part. Let it touch the baser part if it liked now and then, but with a stern repressing hand. If they must have women's legs, do not let them put her in the brightest stocking they could conceive.

PETERBOROUGH CATHEDRAL.

THE appeal of the Dean of Peterborough for aid towards restoring the damage done by the recent storm to the west front of that cathedral has drawn the following remarks from Mr. William Morris:—

Everyone who has any interest in art or history must be much moved by this accident and wish for its speedy repair. I may add also that for some years past it has been known that this magnificent work of art, which is by common consent the noblest and most beautiful of our English west fronts, has shown signs of movement, probably due to some defect of the foundations caused by the draining of the fen-land, so that a thorough search into its present condition has been recognised to be necessary. I must say for my own part that an intimate acquaintance with the west front of Peterborough has made it so much a part of my life that I long to see it put out of all peril by judicious repair and essential strengthening of its structure, and I have no doubt that the Dean shares this feeling with me.

I heartily wish I could leave the matter here with a promise of what pecuniary aid I could afford, but there is another danger to which this great monument of English art is exposed besides that of falling into ruin. There are two ways in which it may be dealt with by its responsible guardians—the first would be the successful, the second the unsuccessful way. If treated successfully it will come out of this trial with its beauty intact, its external appearance unchanged from what we have known and admired in our lifetime. Unsuccessfully treated it will bear the appearance of a modern piece of work founded on an ancient design, and in that case it will have lost the greater part of its interest in the eyes of the historical student and the wide-minded artist; in short, it will have been "restored," and its genuine existence will have come to an end. That this is no chimerical danger is obvious from the fact admitted by almost all observers, that all our great architectural monuments have suffered more or less from the "restoration" mania during the last fifty years, and that some (e.g. Worcester and Lichfield Cathedrals, to go no further) have been almost destroyed by it.

I am well aware that the difficulties in the way of successful structural repair of Peterborough west front are, from the nature of the case, very great, that they are serious enough to tax heavily the skill and experience of the best masters of construction amongst us; but at the same time I am sure that they can be overcome by patience and the expenditure of a large sum of money. Only I think the occasion so important that the burden of undertaking the work should not be thrown on one man's shoulders, and that a consensus should be held of the best engineering and building skill before the critical part of the work is undertaken; though the preliminary work of supporting and shoring the threatened parts should be put in hand as soon as possible. And again I must say that if the front be taken down and rebuilt, instead of being made safe in its place—as I cannot see any reason to doubt it may be—the work will not be done, but undone, and a lasting shame will lie upon all who are responsible for the preservation of the fabric.

It would be a great relief, therefore, to all genuine lovers of the master art of architecture if we could receive an assurance from the Dean (1) that as little disturbance of the surface of the building shall take place as possible, and that consequently no merely decorative features shall be reproduced in imitation of the old work. (2) That every device which skill and knowledge can suggest shall be exhausted before rebuilding be even thought of, and that consequently a committee of consultation chosen from the best (not necessarily the best known) engineers and architects shall be called together to consult on the various devices for making the west front good. I think that the public have a right to ask the Dean for the fullest possible information of what is intended, to be done before they respond to his very reasonable and necessary appeal for funds. I cannot doubt that he will give that information readily and freely.

THE DURHAM EPISCOPAL CHAIR.

A FEW days ago, says the *Durham Chronicle*, whilst workmen were removing the debris which had accumulated on the floor of the chapter-house at Durham, they came across the seat and sides of the ancient stone chair in which the bishops of the see from Carleph to Barrington had been successively installed. It will be remembered that when the chapter-house was destroyed in 1796, that interesting relic of antiquity, the episcopal chair, was not thought worthy by the vandals of that period of preservation, and it was opined that it had been completely broken to pieces by the falling masonry. Hence the welcomeness of the discovery above recorded. An opinion was expressed that if further excavations were carried out the stone slab which formed the back of the chair and which is the only part missing would also be found. Whether this extra work will be undertaken we cannot say. But we believe a decision has already been arrived at to erect the episcopal chair in its original position in the chapter-house, and to utilise those portions recently discovered.

GENERAL.

The Judges appointed to consider the designs sent in for the Museum of Egyptian Antiquities have awarded the four prizes of 236*l.* each to MM. Bréasson, Loviot & Bernard, Guilhem & Gilet, and Drougnon. The prize of 104*l.* was won by M. Trouchy and Adrien Bey. There were eighty-seven competitors.

The *Conversazione* of the Society of Arts will be held in June in the Guildhall, by permission of the Corporation of London.

A New Grammar School is to be erected in Southampton by the Governors of King Edward VI. Grammar and Taunton's Trade Schools.

Mr. Frank Bowcher has designed the medal to be issued by the Corporation of the City of London in commemoration of the opening of the Tower Bridge.

The Gateway at Calais which was erected in 1635 is now being demolished. It was introduced in Hogarth's picture, and the artist was arrested for sketching it without authority.

A Model of the chapel of St. Peter Martyr, Milan, one-tenth full size, has been placed in the Dublin Museum of Science and Art.

Mr. J. Price Evans has been elected engineer and surveyor to the Wrexham Rural District Council out of forty applicants.

A Paper on "Architecture as a Craft" will be read at the meeting of the Liverpool Architectural Society on Monday next, by Mr. E. R. Taylor, of the Birmingham Art School.

The Count de Susor, chief architect of St. Petersburg, has been elected corresponding member of the French Académie des Beaux-Arts.

An Exhibition of Corot's works will be held in Paris in June, with the object of obtaining funds for the memorial of the painter, by Cros, which is to be erected in the Parc Monceau.

Mr. Joseph Farrow, of Marylebone, has received the appointment of highway surveyor of the Brigg district, Yorkshire.

The Abbé Duchesne, one of the professors of archæology in Paris, has received the appointment of director of the French School at Rome, in succession to M. Geoffroy.

The Ilkley District Council on Wednesday resolved that the whole of the designs submitted in competition for the proposed isolation hospital be discarded, in consequence of the plans not being satisfactory without rendering necessary considerable alteration and additional outlay; also that plans be prepared for a hospital to accommodate sixteen patients, and that such buildings as can be completed by an expenditure of 3,000*l.* be proceeded with after the sanction of the Local Government Board has been received.

A Fire which took place on February 17, destroyed the whole of the books, records and instruments belonging to Professor Milne, in Japan. The loss is irreparable, for there were documents containing the Professor's observations on earthquakes during a quarter of a century.

From a Revised List it appears that there are now on the books of the Institution of Civil Engineers 6,737 members of all classes, there being 17 honorary members (including five princes of the blood), 1,862 members, 3,687 associate members, 355 associates and 816 students.

Lord Savile has purchased and presented to the National Gallery a large picture by Velasquez representing *A Belshazzar*. The picture, which is a boldly-executed and masterly sketch rather than a finished work, was at one time the property of Sir Edwin Landseer.

The Architect.

THE WEEK.

THE situation of Mr. HINE, "sat on" by unfeeling predominant partners in his assessorship of the Portrane Asylum competition, must commend itself to any one with a sense of humour; but there is much else which can be enjoyed by all who love a joke. The majority of the assessors, when introducing the gratuitous and uncomplimentary, if not somewhat insolent, record into their report—of "regret that none of the competitors appeared to possess any experience of asylum planning"—hit with a sorer feeling than they reckoned at least four of the competitors, architects of repute not less than Mr. HINE or Mr. MITCHELL, and who have had much experience in asylum building, for they have carried out large works under the Irish Board of Control. These are Messrs. DEANE & SON, Mr. T. DREW, Mr. FULLER and Mr. PARRY. Now their schooling has been under officials of high rank in Ireland. The features in the designs of the above architects may be taken for the most part as the embodiment of official wisdom and experience of Irish official expertness, be it good or bad. With regard to the special usages of Irish asylums, something of resentment of the slight may be gathered in the marked compliments of the Irish officials in returning unsuccessful plans at such entire variance with the rude dictum of the assessors. What brought so uncalled-for and offensive a paragraph into the report at all has yet to be discovered. Irish architects, never backward in coming forward to give as good as they get when epithets are in the air, will probably have their own to say to the assessors when they get sight of the report. The "assessed" appear to have a good point to score against the assessors. There is no question that the conditions placed in the hands of both laid down that they were to be "regularly adhered to and enforced;" that the assessors were "to select from the designs sent in to any number not exceeding three which they consider of merit, placing them in order of merit." That the assessors did not discharge the last explicit duty (which the architects predominant together, should in duty to their professional brethren have insisted on) is a grave matter, capable perhaps of some explanation, but that Messrs. HINE and MITCHELL will find themselves at the tribunal of professional opinion on defence is to be expected. There is no question of the fact that one more large competition launched under most admirably fair conditions has turned out a fiasco.

It was announced at the last meeting of the Tunbridge Wells Town Council that the joint committees had settled on a central site at Mount Pleasant, between Monson Road and Lloyds Bank, for a technical institute, baths and other public buildings. There was no other site in Tunbridge which was so eligible for the contemplated municipal buildings. It has an area of about two acres, and will cost about 20,600*l*. The report was adopted with unanimity.

A PAPER on a remarkable ogham stone was read by the Earl of SOUTHBESK before the Scottish Society of Antiquaries on Monday. It was recently found in digging a grave in the churchyard of Abernethy, Perthshire. A few days after its discovery the stone was sent for inspection to the Museum of Antiquities, Edinburgh, where doubts arose as to the character of its inscriptions, which, if not fictitious, appeared to have been recently tampered with. In general character the inscriptions on the stone resemble no existing example. The stem-line is horizontal and as straight as if run with a ruler instead of being irregularly band-drawn and vertical, while nothing resembling the arcs on the line or the crown and bird above and below it occurs elsewhere. The letters are all vowels and the inscription yields no definite meaning, instead of embodying proper names in the manner of all other ogham epitaphs. The workmanship is suspicious, the lines being mere scratches, such as might be produced by an iron nail, and their freshness is so glaring that they cannot but be recent. The presence of moss on one edge of the stone shows that

that part of it must have been not long ago exposed to the air. Finally, the neatly-balanced arrangement, the affectation of novel ogham forms, the easy symbolism of the crown and the dove, and the triteness of the initial capital beneath the crown, were all suggestive of modern forgery. After having stated the arguments in favour of the inscription in similar detail, the Earl of SOUTHBESK pointed out that it bears no resemblance to any ogham relic in Ireland, England or Wales, its letter-forms being Pictavian, though its symbolism rather approximated to that of a mithraic, gnostic, or semi-Christian type.

LAND surveyors in England will rejoice if the proposal of Lieutenant-General E. F. CHAPMAN, for the undertaking of a geodetical survey of Africa, will be promoted by the forthcoming Geographical Congress. In a letter to the President of the Royal Geographical Society, he writes:—"My suggestions are that the congress should be invited to consider and bring to the notice of the various Governments concerned and to the geographical societies of the world the following subjects:—1. The advantages to be gained from an economic as well as from a scientific point of view of extending geodetic surveys in the settled portions of Africa. 2. The importance in districts beyond the probable range of geodetic surveys for the next few years of making surveys of areas rather than of routes; and the advisability of basing such surveys on rapid theodolite triangulations wherever it is practicable to do so. 3. The desirability of collecting a complete record, as regards Africa, of all the positions that have been accurately fixed astronomically in areas that have not been triangulated, and of combining measures for the purpose of determining new positions, taking care that, in the case of all future observations, full data should be published so as to enable the geographical world to appraise them at their proper value." Unless the European countries who have taken possession of Africa will unite for the purpose, it is not likely that a general survey is ever likely to be executed.

THE French Government have presented Mr. LOUIS H. SULLIVAN, of Chicago, gold, silver and bronze medals in acknowledgment of his gift of a collection of models of architectural decorative ornaments to the National Musée des Arts Décoratifs in Paris. According to the *Inland Architect*, the notification from the director of the "Centrale Union des Arts Décoratifs," of Paris, informed Mr. SULLIVAN in terms most complimentary that the medals were designed and made especially for him, as a proper acknowledgment of his courtesy in making the gift. They were also intended as a tribute to the beauty and artistic merit of the art models. The specimens of Mr. SULLIVAN's work include a large number of casts of ornaments which adorned the Transportation building at the World's Fair, replicas in bronze of the doors of the Wainwright memorial in Bellefontaine cemetery, St. Louis, and the door of the Getty tomb in Graceland cemetery, Chicago. During the World's Fair the art commissioners of France were particularly impressed with Mr. SULLIVAN's work. Recognising the artistic merit in the decoration of the Transportation building, the classic lines of the models of the tombs, and the delicate spirit displayed in their ornamentation, the official request was made at the close of the fair for a loan of models of all to the museum in Paris. Mr. SULLIVAN presented the models to the commissioners. They were not only promptly accepted and the especial medals voted to the donor, but a further graceful acknowledgment of the gift was the naming of the section in which the models have been placed "The Louis H. Sullivan Section." In the official letter which informed Mr. SULLIVAN of the shipment of the medals there was also enclosed a request from the director of the Russian School of Applied Arts at Moscow, for the particular privilege of reproducing the models for use in the school. Accompanying the request was also one from the French commissioner, desiring Mr. SULLIVAN to make his permission sufficiently general to allow other art schools in Europe the same privilege. This request was made, stated the commissioner later, as the models had, during their few months' exhibition in Paris, excited so much admiring comment among artists that other art schools on the Continent were almost certain to repeat the request of the Russians.

CLAUDE LORRAINE.

IN the year 1600 CLAUDE GELLÉE was born at Chamagne, in Lorraine. He thus appeared among men just six years before JOHN MILTON. The affinity between the two was evidently in REYNOLDS's thoughts when he said, "A landscape conducted under the influence of a poetical mind will have the same superiority over the more ordinary and common views as MILTON's 'Allegro' and 'Penseroso' have over a cold prosaic narration or description." The poet and the painter were alike fascinated by the sun, and rejoiced in watching its effects. If any English noble wished to have a picture that would express in form and colour

the eastern gate
Where the great sun begins his state
Rob'd in flames, and amber light,

there was only one hand in all Europe, in the seventeenth century, that was competent for the task, viz. the sickly Lorrainer's. In the early part of the seventeenth century landscape art was only in its infancy. It was derived from the theatrical scenery which BALTHAZAR PERUZZI, the architect, employed to enhance the attraction of "La Calandra" when it was represented before LEO X. The art had advanced between that time and CLAUDE's appearance in Rome. But there was no attempt to express the effects of the "bright effluence of bright essence increate" in giving animation to land and water, until he tried. The landscape backgrounds, like the historical landscapes of the earlier time, had excellent qualities, but as they were deficient in that contrast which comes from the operation of light and which alone could give them animation, they could not adequately suggest what MILTON calls "day, or the sweet approach of even and morn." The introduction of APOLLO in his chariot in the upper part of a picture was a sorry substitute for the sun, and an academic laying out of light and shade in definite proportions across a view could not atone for the absence of that vivid luminousness which can have only one source.

CLAUDE, by his innovations, enriched the world, but it cannot be said that of late years artists are much given to the acknowledgment of their debt to him. Nor is that circumstance surprising. Since his time nature has been studied with a scrutiny that is almost microscopic. Artists have not been able by their studies to gain more knowledge of men and animals than was possessed by the Greeks. But with that form of nature which is classed as landscape, an exactitude of knowledge has been acquired which would amaze not only CLAUDE and his successors, but the Greeks in their best days. It is expressed by the one word detail; not merely in the pre-Raphaelite or photographic sense of presenting everything that exists in a scene, but by a correspondence between all parts, however uncommon may be the circumstances, and which can only be attained by constant and loving watchfulness of phenomena. In REYNOLDS's day, although landscape art was not popular and patrons were willing to accept a conventional treatment, the new spirit was making itself felt, to his own uneasiness. It becomes evident when we hear him saying, "Whether landscape-painting has a right to aspire so far as to reject what the painters call accidents of nature is not easy to determine. It is certain CLAUDE LORRAINE seldom, if ever, availed himself of those accidents; either he thought that such peculiarities were contrary to that style of general nature which he professed, or that it would catch the attention too strongly, and destroy that quietness and repose which he thought necessary to that kind of painting." The change of style is indicated when we find CLAUDE's countrymen waited until the present time before they proposed to erect a statue of him in any public place.

In England it is excusable if we are indifferent, and it may surprise many to find that a biography of the landscapist had been added to the "Portfolio" Series ("Claude Lorraine," by GEORGE GRAHAME, London: SEELEY & Co., Limited). Our TURNER is supposed to have surpassed the Franco-Roman artist. That was one of the results of Mr. RUSKIN's eloquence and polemic skill. TURNER's injunction that two of his landscapes should be hung side by side with CLAUDE's was evidence of his belief in the power of his advocate and his confidence in the judgment of his countrymen. It is well, however, to remember

that Mr. RUSKIN, with all his enthusiasm for TURNER, has to acknowledge that CLAUDE is not deficient in good qualities. He testifies to CLAUDE's feeling for beauty and form, his tenderness of perception, his unequalled aerial effects, his sincerity of purpose, his endeavour to be true so far as he felt the truth, and his pains to represent waves and skies as he saw them. But more exactness was needed, owing to the influence of science, and Mr. RUSKIN is right when he says, "large admiration of CLAUDE is wholly impossible in any period of national vigour in art." CLAUDE was a revealer, a seer, and we must not quarrel with him if some who came after him were endowed with keener vision. GOETHE, who was always free from being led away by partiality for a favourite artist, determined the position of the landscapist when he said to ECKERMANN, "CLAUDE LORRAINE knew the real world thoroughly, even to its smallest detail, and he made use of it as a means to express the world contained in his own beautiful soul. He stands to nature in a double relation: he is both her slave and her master; her slave by the material means which he is obliged to employ to make himself understood, her master because he subordinates these material means to a well-reasoned inspiration to which he makes them serve as instruments."

The life of CLAUDE is one of the most attractive in the whole range of the biographies of artists. CARLYLE, who was contemptuous towards art and artists, makes an exception in his favour. "Whose taste in painting," he asks, "is truer and finer than CLAUDE LORRAINE's? and was he not a poor colour-grinder, outwardly the meanest of menials." It was CLAUDE's fate, before he attained the colour-grinding stage to have passed through many vicissitudes. His parents were so poor they were unable to keep him at school for more than a brief period, and it is supposed that he was bound apprentice to a baker. He was an orphan in his twelfth year. Evidently he must have suffered misery in the bakehouse, for, although he was the least enterprising of mortals, he ran away to Fribourg in Brisgau, where an elder brother was occupied in wood-cutting. From him young CLAUDE received some instruction in drawing. After some months he followed a relative who dealt in lace to Rome. Nobody wanted him in Rome, and he turned towards Naples. There he was fortunate in obtaining employment of a humble kind with GOTT-FRIED WAELS or WALSH, in whose painting-room he was initiated into the mysteries of colour-grinding.

It has been ascertained he was back in Rome in 1619, and served as a humble factotum with AGOSTINO TASSI. The master was one of those swaggering fellows who so often appear in the history of Italian art. He had studied under PAUL BRIL, the Fleming, but in his early manhood his career might appear to be marred, for he was sentenced to ten years at the galleys. On his release he worked for other painters, and eventually won the favour of the Pope. He was expert in a sort of decorative work, in which he utilised perspective, and his experience on board a galley enabled him to paint seascapes more effectually than was common. TASSI seems to have commiserated the delicate CLAUDE, and he made a competent painter of his assistant. How long they remained together is not to be discovered. CLAUDE, about 1625, appears to have left Rome and travelled in a roundabout way to Lorraine. Nancy was the capital of the dukedom. It did not then display the marvellous collection of ironwork which now adorns almost every street. But it possessed fine Mediæval and Renaissance buildings. CLAUDE was engaged by DERUET, who had a monopoly of the most important works of decoration, and was employed on the ornament of a Carmelite church, which is now destroyed. He was too restless to remain in Nancy, and in 1627 he is found again in Rome.

The landscape decorations which were then common on the walls of salons afforded him employment. Probably he imitated TASSI's work, in which at an earlier time he was allowed to co-operate; but that sort of conventional treatment did not satisfy him. SANDRART, who professes to have been well acquainted with CLAUDE, gives us a glimpse of the early studies by which he prepared himself for nobler work than decoration. He says that CLAUDE used to spend whole days in the Campagna recording phenomena, and from the sketches he composed his

pictures. His spare hours were occupied in drawing from the life, or from sculpture at the Academy. He never was very successful as a figure-painter, but few landscapists were better able to utilise imperfect figures for positions in foregrounds. In his *Village Dance*, which is in the Louvre, he must have employed one of the Dutch painters to fill in groups; but, with all the merits of the figures, we doubt if they are more satisfactory than CLAUDE's own puppets. Whatever may be his success in representing landscapes, there never was a man who was more absorbed by art. In his concentration he can be compared to MICHEL ANGELO.

Whether patrons were drawn towards him suddenly or by slow degrees is unknown. He is supposed to have gained a name before 1635, and the favour he then secured was constant for nearly half a century. CLAUDE was one of the few painters who met with the reward which their labours and talents merited. His countrymen were among the earliest to recognise his powers. This is evident from the pictures by CLAUDE which are in the Louvre. The *View of a Harbour by Sunrise* and the *View of the Campo Vaccino* were painted for DE BETHUNE, who was French ambassador in Rome. *A Village Fête*, *A Harbour at Sunset*, *The Landing of Cleopatra* and *The Consecration of David*, *The Ulysses* and *The Harbour Scene* all belonged to LOUIS XIV. Some pictures were painted for Pope URBAN VIII. He received an order from England as early as 1644, and from various parts of Europe commissions were sent to him.

His pictures can be traced partly by the help of records and partly by his *Libri Veritatis*, but the artist himself remains for us unknown. Apparently he lived alone, as is usually the case with giants, but it seems incredible that at a time when so many strangers were attracted to Rome, and when so many competent writers lived there, not one of them has described for the benefit of a future age the man himself or his surroundings. Even his will throws no light upon his life. The only legatee was a nephew, whose services he acknowledged by bequests. Most of his property went to a child called AGNES, who was brought up in his house out of charity. He could not be his own biographer, for he did not possess sufficient knowledge of any language to write at ease. Under the circumstances it is hardly possible to supply more information about CLAUDE than appears in Mr. GRAHAME's sketch.

Critics have found fault with CLAUDE for the prominence which is given to buildings in his paintings. We should remember that CLAUDE lived in a city which was remarkable for its architecture, and during many of the years in which he resided in Rome buildings were in progress. He could hardly escape their influence. He must also have perceived that for expressing the effect of light he could find no masses more serviceable than buildings. In modern times more delicate effects can be produced by the aid of trees, but CLAUDE was a pioneer, and he prepared the way which later artists have followed. The rigid lines of buildings were also admirable foils to the natural objects he painted. Finally, it should not be forgotten that CLAUDE was a solitary, and during a large part of his life an invalid. To him a natural scene from which man and his works were absent was not a pleasing sight. Like many great artists, he testified to the importance of architecture, and for his reverence to the art he deserves our admiration.

PAINTINGS IN CHURCHES.

THE earlier Christian converts being Jews carried with them all those prejudices against the representation of life so rigidly guarded against by their law, as well as by the often-denounced practice of the pagan nations by which they were surrounded. Their zeal, indeed, against the arts so extensively used in the heathen temples may be learnt from the strong invention of their apologists. They even carried their enmity against the artists themselves, excluding them from their communion, if as converts they continued to practise the hated profession and denying the rite of baptism to those candidates for admission unless they renounced it. As they obtained more power and influence, we have instances of fanatical rage similar to that of the Puritan of a later time, and perhaps the progress of Christianity more than any other abuse hastened the downfall of the already declining art of antiquity. But it is evident that the accession of heathen converts to their communion must gradually have weakened

this prejudice, and it was from among them that the practice first obtained.

The first public notice that we find taken of paintings in churches is among the canons of a provincial council held at Illiberis, now the city of Elvira, in Spain. The precise date of this assembly is unknown, but it was near the close of the third century. The words of the canon by which the practice is unreservedly condemned are emphatic and precise. It says:—"It is decreed that pictures in churches ought not to be, neither may what is worshipped or adored be painted on the walls." This condemnation of itself argues a somewhat extensive application of a principle; but it should be observed that in this sentence we must not recognise the voice of the Church, for it is certain that it never received universal attention, and in all probability its influence was not felt beyond the province in which the council was assembled.

The first indications of a yearning towards representation in the Christian society was evidenced by the use of symbolic forms—such, for instance, as the fish, the lyre, the dove, the lamb, the vine, the palm, the ship, the anchor; to which may be noticed the cross, as probably the earliest of all, and the monogram of the holy name.

It is in the catacombs of Rome—places consecrated so early to Christian worship, through the dangers to which its early professors were exposed—that we meet with the earliest examples of the use of painting in the new religion. These are very evidently the productions of converts from the heathen, as they so closely resemble in style and character the previous pagan decorations. Indeed, this resemblance is so remarkable that it requires a very narrow examination of the subjects to distinguish the one from the other. It is also observable that the selection of subjects betrays extreme caution and reserve; those having an indirect allusion to the doctrines of Christianity, by way of antitype, being at all times preferred. Of these, the most frequent was the story of the prophet Jonah, which was generally told in four compartments: the first shows a naked figure of the prophet reclining beneath a frame on which the gourds are trained; the second shows the mariner casting him into the sea, and it must here be remarked that the idea of the whale is curiously expressed by an animal resembling the sea-horse of classic antiquity; the third, the monster casting him upon land; and the fourth represents him seated.

A selection of miracles from the Old Testament was also of frequent occurrence, arranged together thus:—Noah receiving the dove returning with the olive-branch, Moses striking the rock, the manna in the wilderness, Abraham about to offer up his son Isaac, and a few others. Of subjects from the New Testament, though rarer, many were particularly selected, such as the paralytic carrying his bed, the raising of Lazarus, restoring the blind to sight, &c. The manner of treating these subjects was peculiar, and exhibited a symbolic tendency. The introduction of the figure of the Saviour is rare, unless it be under the form of the good shepherd carrying on his shoulders a lamb strayed from the flock, but there is no attempt at any peculiar elevation of character. Another popular subject belongs to this period of Christian art, and this only; it is that of Orpheus playing on the lyre, plainly taken from Pagan art, although there was a strong inclination to give to the Orphic hymns a prophetic character. The earliest design in which the Virgin and Child are introduced is in the catacomb of St. Calistus, pope, on the Appian Way; this is the adoration of the Magi, who are all represented in the Phrygian cap.

One of the earliest descriptions of the decoration of a Christian church that has come down to us is found in one of the epistles of Paulinus, bishop of Nola, who flourished at the latter half of the fourth century, the contemporary of Saints Augustine and Jerome. Paulinus was a native of Aquila, of senatorial rank and of great wealth. He became a convert to Christianity and was exceedingly zealous in his new faith, in proof of which he constructed a magnificent church near Nola, in honour of St. Felix the martyr, of which he has given a very interesting and minute description both of the arrangement and of the nature of its decorations. Among other things he describes the paintings introduced on the walls and vaulting, all of which appear to have been selected from the Old Testament. Then he continues to enumerate and descant on the several subjects, from which it appears that it contained the story of Moses, the passage of Jordan, the story of Ruth and Orpah, and, arranged on walls opposite to each other, the temptation of Job, the stories of Tobit, Judith and Esther. We also learn from him that the custom of affixing descriptive legends or texts illustrative of the subjects had already obtained, for he says, "alluding to the subject which is expressed above by titles, that the letter may show what the hand has explained." He concludes by asking his friend if by chance he should require some reason for this new practice of painting the sacred houses, he will show it in a few words. He then goes on to say that the place was frequented by a rustic crowd not learned in reading, for whose edification it was intended; and that such had been the effect that, "behold, frequent vigils extend through the whole night."

In the fourth century the arts were rapidly declining, but if we could place confidence in descriptions we might yet imagine a power existing of no mean character. Among the records of the second Council of Nice there is an account of a painting of the *Martyrdom of St. Euphemia*, given by Arterius, bishop of Amasia, belonging to this era, in which the diversities of expression are particularly noted and described, and the highest encomiums are bestowed upon the painter, not, indeed, undeservedly if his work answered the description. "Greatly I admire," says he, "the painter who modesty and manliness could so combine;" and in another part he bears testimony to the faithful and expressive colouring thus:—"For so manifestly and evidently the painter has coloured the drops of blood that you might swear it flowed from the lips, and with weeping you are compelled to depart." In this country there can be no doubt that painting was introduced with Christianity itself by the missionary St. Augustine, as Pope Gregory the Great said it was chiefly for the sake of the heathen, instead of reading, that they might learn from them what they ought to worship. Thus, in the seventh century, we find two eminent men, St. Wilfrid and Benedict Biscop, both employing the arts extensively in the service of religion. Bede gives an account of the latter bringing paintings from Rome to adorn his church at Wearmouth. The images of the Virgin Mary and twelve apostles were disposed on the roof at the east end, carried from wall to wall, arranged apparently in tablets or panels, for they were doubtless executed on wood and in distemper. Subjects of Gospel history were disposed on the south wall, the visions of the Apocalypse of St. John on the north. A similar testimony, drawn from the same authority, is given by Gregory Nazianzen, who said he could not contemplate a picture of Abraham about to offer up his son without shedding tears. We must, however, accept these testimonies with some reserve, for at a later time, when the arts were in the lowest state of degradation, it is not uncommon to meet with similar encomiums. There can be no doubt, then, that the close of the century saw the principles of decorating churches with paintings established far and wide wherever Christianity was to be found, and it seems to have gone on silently without encountering any opposition, except, perhaps, from small communions of heretics.

That abuses, however, had crept in very early we have the testimony of St. Augustine, who says that he knew many who were adorers of pictures and sculptures, but it was not until the eighth century that an attempt was made to suppress the practice. This, however, was attempted by the Emperor Leo, known thence as the Iconoclast. By him religious pictures were proscribed in the churches of Constantinople and the provinces; they were, by his edict, defaced and covered with a smooth surface of plaster; but so greatly were the popular feelings outraged by these proceedings, that civil war, embittered by theological controversy, raged throughout the Roman empire for upwards of a century. To settle the question, his son and successor, Constantine, called a council of the Church at Constantinople, A.D. 754, which pronounced a unanimous decree that all visible symbols of Christ, except in the Eucharist, were blasphemous, and that all such monuments of idolatry should be destroyed. Notwithstanding, however, the vigorous persecution of those who fondly clung to a practice to which they had been so long accustomed, this decree was found impossible to be enforced. The second Council of Nice, which took place in 787, finally settled the question as regards the Church, and produced a very permanent effect on the practice of church decoration. The records of its proceedings contain a vast deal of information relative to the doctrine of the Church on the subject. It asserted, contrary to historic truth, the continuous use of pictures from the time of the apostles; but its decrees respecting the relation of art to the Church were the most important, because of the extraordinary influence that they had in reducing art to a mere convention dependent on the theologian. The council decreed that the structure of images was not the invention of the painter, but the approved legislation and tradition of the Church; and in another place it says, "the art alone is the painter's, but the ordination and disposition the holy father's." The consequence was that from that time art lost its mental activity and remained stationary for centuries, and in the Greek Church to this day it affords a most singular phenomenon of the repetition of the same forms handed down from one generation to another, so much so that MM. Didron and Durand, the French antiquaries, remarked in a tour in Greece in 1838 that the resemblance between works executed at St. Mark's in Venice by Greek, or as they are better known Byzantine, artists in the tenth century was complete, even to the number of folds in the drapery, to works many centuries subsequent; as doubtless it was the monasteries of Mount Athos that furnished with designs the artists who, from the seventh to the twelfth centuries, filled the churches with their productions. The influence of Byzantine art was felt throughout Europe for many centuries. Their art,

founded upon the decrees of the Council of Nice, remained, as before observed, a fixed type without improvement, possessing but a limited mechanical power and still less feeling for nature.

The freer spirit of the West naturally operated very powerfully in destroying this domination which fettered the hand of the artist; for although convention can be observed even to the end of the fourteenth century, yet there were many departures from its influence. It is exceedingly curious to note this feature in Mediaeval religious art, which we have many opportunities of observing throughout the twelfth, thirteenth and fourteenth centuries, whether seen in MSS., sculpture, or paintings on the walls of churches; even in the technical delineation of form, down to the middle of the last-mentioned period, there seems to have been a fixed rule. This may be partially noticed in the mode of drawing the features, which certainly for a whole century does not materially differ.

After the decision of the Council of Nice no serious opposition was made to pictures in churches, and there can hardly be a doubt but that every church had some kind of religious painting on its walls.

In the twelfth century, when so great an impulse was given to the arts, we find the voice of the eloquent St. Bernard raised against those strange combinations of forms painted on the walls of churches; monstrous centaurs, half men, spotted tigers; and he continues, "you see under one head many bodies, and again in one body many heads. Here is discovered the tail of a serpent on a quadruped," &c.; and he observes, the whole day is occupied in admiring these things, rather than in meditating on the law of God. The grotesque figures common in Norman work are similar to those alluded to by this father.

The improvement and advance in architecture in the twelfth and thirteenth centuries was accompanied by a corresponding progress in the art of painting and design, and our parochial as well as our cathedral churches received as much decoration as expense and circumstances permitted; and thus it continued until the sixteenth century, when one of the earliest acts of the Reformation in this country was the condemnation of paintings in churches; at this period they were covered with whitewash and defaced, and their places supplied with texts of scripture.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of this Association, Mr. W. W. Robertson, president, in the chair, Mr. John Kinross, A.R.S.A., gave an address on St. Andrew's Priory, in which he dealt in the first instance with the history of the buildings, and proceeded afterwards to describe in detail the excavations which Lord Bute had undertaken in connection with the ruins. He gave it as his opinion that the evidence was amply sufficient to prove that the monastic buildings were commenced after the cathedral building was completed. A large ground plan, which was exhibited, showed the extent of the information regarding the dimensions and the site of the ancient buildings brought to light in the course of the excavations. Mr. Thomas Bonnar read a paper on "Some Notes on Ancient Mural Decorative Art in Scotland." Dividing the subject into two divisions—the ecclesiastical and the secular periods—he said of the first that, owing to the ravages which left the ancient religious edifices of our country in a totally ruinous condition, there were only two examples known to him of ecclesiastical coloured work illustrating this phase of art in Scotland. The more important specimen was the groined roof of the crypt of Glasgow Cathedral. That remarkable and highly interesting piece of decorative work, although in a decayed condition, showed by its presence on the roof of that ancient structure, which dated back to the twelfth century, that the interiors of religious houses were highly decorated with ornamental forms, and that the use of rich colouring was prevalent in those early days of the Church in Scotland. From its character, composition and colour it was typical of the predominant conception which ecclesiastical authority adopted for the internal embellishment of the cathedrals and churches under the dominion of the Pope at that era. The mullions that formed the groined arches of the roof were deeply moulded and filled in with full colouring of red, yellow and white. The centre bosses were also tinted with similar colours, and there was evidence that the enriched carvings had been overlaid with gold. At the intersections of the groins and at the bases of the arches there were painted on the plastered stone arches richly twining ornamental scrolls representing conventional foliage, the prevailing tint being green. The drawing of the ornament exhibited great precision, while it retained much spirit in the flow of its lines, proclaiming it to be the work of a proficient artist. These particulars were noted many years ago, but he was surprised and disappointed to find on a recent visit that not one vestige of the ancient work now remained. So thoroughly had it been obliterated that it was evident that the chisel had been employed to accomplish it—the worst act of vandalism of recent times.

The other proof of colour being introduced on stonework was to be seen in Dryburgh Abbey within the chapel adjoining the one where lies the greatest of the romancists, Sir Walter Scott. Though but a humble example, it served to show that such treatment of the stonework with colour was considered requisite for the full effect of the Church ritual in that remote period. Looking at these examples, they were justified in believing that the art of those early days must have been of an elevated and sincere kind. By way of comparison, specimens of contemporary decorative work in England were described, and a brief sketch of the rise of the art was given. Turning to the secular part of the subject, he said they were in the more fortunate position of having fairer representative examples to illustrate the condition of domestic interior coloured decoration previous to the Reformation period, although, owing to the absolute and discreditable neglect they had been subjected to, they had no doubt lost many specimens of mural decorative gems from the ceilings and walls of their ancient castles and mansions. It was impossible to determine the probable date when this class of work was first used for interior decoration. The earliest dated ceiling extant was the Nunraw one, the year inscribed on which was 1461. Borthwick Castle, which dated from 1430, with its handsome hall and stone arched roof—the surface of which was plastered over at the present time—showed traces of both design and colour having been carried out on a most elaborate scale. Its treatment and motive bore some resemblance to the timber roof of the church of Largs, which dated from 1636. In depicting the family escutcheons on these ceilings, which had now become historical, the artists had clothed them in floriated compositions of grotesque masks and quaint ornamental forms drawn in freehand, and throughout the composition a satirical humour underlay the motive. On the coats-of-arms, which were the main feature of the schemes, were painted the quarterings of many of our leading families, the medium employed being distemper. To the initiated the story suggested by the character of the heraldry thus represented was that of thrilling scenes of embroilment and tragedy, and happily also of peace and harmony, enacted within the walls that enclosed them. It was with a feeling of pride that they laid claim to this as a native type of decorative art, for with little difficulty he had arrived at the conclusion that the workmanship was that of his own countrymen. The characteristics of the art were Scottish, and though the work of foreign artists might be observable, still they could recognise the individuality of native artists in the architecture of Falkland Palace, Linlithgow Palace and Stirling Castle. The now empty niches above the grand gateway in the eastern side of the quadrangle of Linlithgow Palace were once occupied by statues of a pope to represent the Church, a knight to indicate the gentry and a working man to symbolise the commons, each having a scroll above his head, on which were inscribed a few words of legend now irretrievably lost. That was gathered from the records of 1535, which further showed that these statues, together with the group of the Salutation of the Virgin upon the other side of the quadrangle, and certain unicorns and a lion upon the outer gateway, were brilliantly painted. Reference was made to three ceilings—namely, that in the chapel of Falkland Palace and two in Holyrood Palace—which were decorated in the heraldic style, evidently of English origin, and were probably the work of the Court official known by the name of the “Sergeant Painter”—to indicate what was recognisable as not being the work of Scotsmen, and so enable them to include the remaining specimens as purely national. There was a growing opinion in some quarters favourable to the renewal of this mode of painting, and those impressed with the idea of introducing such an attractive style of decoration into our ecclesiastic, civic and domestic buildings should keep in view that the character of the design should especially bear the impress of a native type.

GLASGOW SCHOOL OF ART.

IN his seventh lecture of the series on “Mediæval Architecture,” Mr. Alexander M’Gibbon discussed the Perpendicular style. This style had the longest life of any, and hence the numerous examples extant, though none are of the first importance in scale. Their survival may largely be attributed to the fact that no subsequent style has intruded, as Perpendicular itself had, upon existing work. The artistic motive in the new style was possibly a more self-conscious one than that attending previous developments. There was a desire for a superior beauty; before architecture had rather expressed the Church’s power. Whatever the merits of the style, it was quite an indigenous growth—the first and only real English Gothic. The vigour of the national life of the period should commend to us its architecture, but instead there is prevalent an unaccountable disparagement of both. How original Perpendicular may be realised by a comparison with French Flamboyant, that appears as the natural and inevitable develop-

ment of Decorated; while Perpendicular shows in many points a quite unconscious recurrence to earlier principles. Thus, the more stone-like treatment of bar tracery that was in effect plate, but with a greater depth than Norman E. E. ever had; fan vaulting in which extremes met, for when the ribs became most numerous in reality it was the vault surface that again, as in Romanesque, was the constructive necessity; the depressed arch, that was an invention artistically only less valuable than the Pointed, for if the earlier form permitted of a greater height than the semicircular semicircle, without the objectionable stilt, so the latter made possible a lesser height by other means than the equally unsatisfactory segmental arch. The flat roof, too, was again of the pitch best suited for its lead covering and alike internal and external appearance was expressed by the gable. Even the all-prevalent panelling may be defended as decoration of the wall proper—Mr. Ruskin’s “veil”—in more architectural fashion than mere rustication, however elaborate; for it can hardly be questioned that the wall is as worthy of embellishment as the fenestration that in Renaissance was the principal field of display; while in Roman practice there was an imposition of an order that ignored both wall and window. The lacking feature in the style was the column. Previously it had been minimised to the engaged shaft; but now even that was frequently dispensed with, and arch moulds were continued to the ground. To persist in denying ourselves the use and enjoyment of this chief of architectural features is to provincialise the style, so in any revival of Perpendicular the column should certainly be reinstated; and to do this in style will provide scope for legitimate originality. In the closing lecture, the first part was occupied with a review of late Scottish Decorated, principally of the sixteenth and first half of the succeeding century; of earlier work the nave piers of Dunkeld Cathedral, that show the columns retained, were commended as suggestive. At the very close of the fifteenth century, in the crown towers of St. Giles and King’s College Chapel, Aberdeen, appears the most distinctive feature that Scottish Gothic can boast. Her Decorated had more affinity with French Flamboyant than with English Perpendicular, and the cause that prevented the latter crossing the Border seems to have been the decline in the Church’s influence, with the rise in social condition of the worker. The Church was still the chief patron of architecture, but the designer no longer followed, as matter of course, the fashion of the south. The Scoto-French political alliance of the times sufficiently accounts for the Renaissance influence seen in baronial buildings of the period; still, it is remarkable how that style should percolate down to the humblest strata of buildings, and become, in time, the vernacular expression of taste, to the complete abandonment of every trace of Gothic tradition and practice. The review of Mediæval architecture completed, a short notice of Mediæval builders was given. The “master-mason” was seen to be the functionary most nearly approximating to the modern architect, an office that dates from the Conquest, and one generally filled by a layman. Too often architectural credit has gone to bishop and abbot, for the title “surveyor” and “supervisor,” frequently held by prelates, might better be expressed by the word steward; they were cultured and munificent patrons of architecture, but only very rarely indeed actual designers. The limited variety in building and the almost constant type of church plan—since that masonry and, later, carpentry were the crafts directed by the “master-mason”—show that his duties were by no means so multifarious as are those of his successor. The influence of the Freemason is now regarded as much less potent, even in the latest years, than was once imagined. Geometric proportion and numerical ratios in building, if ever generally employed—which is very doubtful—have been so on a principle whose secret is now lost. Ingenious arrangements of triangles may be applied to sections, but we are hardly convinced that their rationale is understood. Mediæval mouldings, too, can hardly be thought of as most logical elaborations of profile to best insure subtle shadow when on north and south frontages they appear alike. True, this applies to Classic as well; but it is only of Gothic that this contention appears of its superiority in the philosophy of mouldings.

At the conclusion of the lecture Mr. T. L. Watson, on the behalf of the governors of the school, expressed gratification of the interest and attendance the course had attracted. Its justification, however, did not lie altogether in monetary success; architecture as an art of first importance claimed the best attention of a school of art, and in this and the preceding course there had been given information, historical and critical, complementary to that practical acquaintance to be gained by study of actual examples in the classroom and by design.

The Plebiscite Voting by the public in regard of the pictures shown by the Glasgow Institute of Fine Arts has resulted in a declaration that No. 191, *A Girl in White*, by John Lavery, A.R.S.A., is the finest portrait in the present exhibition.

TESSERÆ.

Paul Veronese.

IT is no unfair mode of rating the qualities of art to estimate them by the difficulty of their attainment, and the rarity with which we find them in any tolerable degree of perfection. A poet may, in a word or two convey an idea of the complexion of a beautiful woman, and those words often very vaguely used. In the hands of Shakespeare, "Nature's pure red and white" are sufficient; but the painter, to do this, must engage in an actual rivalry with nature herself—a contest in which a distant approach to her is allowed to constitute success. And even such success, in the colour of flesh, has not perhaps been accomplished by twenty artists with whose works we are acquainted—Paul Veronese being one. It must be acknowledged, however, that no painter has less of sentiment or strong expression; but, at the same time, he has never anything of affected sentiment, of which there is so much in art, and which is infinitely worse than none, and the expression we do find in his works is always true to nature. In the picture of *Esther before Ahasuerus* in the Louvre, the whole figure and the face of the fainting queen are admirable. The death-like paleness is exquisitely given, the half-open eyes that see nothing, and the slightly parted lips. She has not fallen, but remains a lifeless weight in the arms of her attendants. But Paul Veronese is seen to great advantage in the Louvre, especially in his two immense works, *The Marriage at Cana* and *the Magdalene Washing the Feet of our Saviour*. *The Marriage at Cana*, it is true, is anything but a relation of the story. But its great merit is that it exceeds all other pictures of its size in noonday splendour of colour and breadth of effect, and it need scarcely be remarked that it is in such pictures, containing an infinite variety of minute parts, that breadth is most difficult of attainment. But in the other picture, though it has suffered much by time and reparation, the same excellences are united with much propriety of treatment and of expression. Paul has imagined the incident to take place, as related by St. Luke, in the house of a Pharisee; and the magnificent architecture might not, therefore, be inappropriate, nor is the violation of the costume so flagrant as in many of his other works. He has given to Judas, who may be known by the purse at his girdle, the meanest head in the picture, but with nothing of the look of a downright villain, and this is perhaps the truest physiognomy of the character. The Magdalene is well conceived—wholly absorbed, unmindful of all about her and what is said, her heart goes with her action. The expression and interest with which a young man, perhaps intended for St. John, regards her devotion, is inimitably natural, and the conception of the whole picture has great dramatic truth; the main incident entirely absorbing the attention of all who, from their situation, are aware of it, while the personages near the right and left extremities of the canvas, ignorant of what is going on, are otherwise engaged. This picture does not rank with or even near the conceptions of Raphael, but it shows that the merits of Paul Veronese are very far beyond the mere verbiage of art.

French Renaissance.

A study of the architecture of the work of Francis I. at Blois clearly shows that the French builders accepted, not the conventional restrictions of the classic formulas, but their essential spirit as an organised scheme of ornament. They did not care for the antique traditions because of the association of these traditions with the greatest triumphs of the race, for they had not yet become scholars; but they were glad to use in their own buoyant way the pilasters, panels and ornaments, the pediments, consoles and architraves which were a part of these traditions, and which enabled them to give free expression to their new emotions. They took up the decorative system of the Romans, and in a spirit of unconscious daring carried it on through another stage of development. Their old Gothic, with all its flamboyant capacities, with all its delicate embroideries, its moulded and fretted chamfering, its elaborate cuspidations and crocketed finials, stood "patiently remote from the great tides of life." It could not give utterance to the joy of a secular liberation the basis of which was the revival, or rather the adaptation, of pagan learning and pagan art. In fact, two centuries ago Mediæval art had in the cathedrals given expression to its highest aspirations and its most beautiful thoughts under an impulse which could never return again. Reminiscences of the age of chivalry, of crusades and of hieratic domination, whether because of a certain sentiment of romantic melancholy, mysticism or ascetic meditation which lingered about them, or because of their technical limitations when expressed in art, could hardly furnish the expression needed in the architectural manifestations of a time when the revival of learning and letters was liberating reason and imagination from the vagueness and poverty in which they had so long been held by the homilies of the fathers and by the crude speculations of monastic schoolmen.

Gainsborough and Reynolds.

Soon after Gainsborough settled in London Sir J. Reynolds thought himself bound in civility to pay him a visit. Gainsborough took not the least notice of him for several years, but at length called and solicited him to sit for his picture. Sir Joshua sat once, but being soon afterwards affected by a slight paralytic stroke, he was obliged to go to Bath. On his return to town perfectly restored to health, he sent Gainsborough word that he was returned, to which Gainsborough only replied that he was glad to hear he was well, and never after desired him to sit or called upon him, or had any other intercourse with him till he was dying, when he sent and thanked him for the very handsome manner in which he had always spoken of him, a circumstance which the President has thought worth recording in his fourteenth discourse. Gainsborough was so enamoured of his art that he had many of the pictures he was then working upon brought to his bedside to show them to Reynolds, and flattered himself that he should live to finish them. Gainsborough was described by Windham as a very dissolute, capricious man, inordinately fond of women, and not very delicate in his sentiments of honour. He was first put forward in the world by a Mr. Fonnereaux, who lent him 300*l*. Gainsborough, having a vote for an election in which his benefactor had some concern, voted against him. His conscience, however, remonstrated against such conduct; he kept himself in a state of intoxication from the time he set out to vote till his return to town, that he might not relent of his ingratitude.

The Function of Taste.

Genius, as far as it has to do with painting, may be considered as the union of taste with imagination. Now, imagination seems to be a power to which instruction can scarcely reach; and if in any degree amenable to direction, it can only be so through taste—a faculty that is admitted to be capable of much improvement by cultivation. By taste, in its most perfect condition, we understand not the mere relish of beauty and of truth, but true judgment; the power that estimates all things belonging to art relatively as well as singly. It has also as much to do with the heart as with the head, for material beauty will never be fully known but to him who knows also what is moral beauty. Imagination may be considered as the active power of genius, taste as the controlling and directing power. It is the temperance which Shakespeare recommended to the actors in their bursts of passion; but, as he also told them, it is not tameness, neither is it mere fastidiousness, much less timidity. It will dare all things for a great end, but it never seeks merely to astonish, nor is it ever presumptuous. It is not exclusive; it objects not to ugliness or deformity, but it assigns to them their proper places. It excludes only falsehood, and this it detects as readily under the most magnificent disguises as when it affects the most childlike simplicity. It would be easy to expatiate on the attributes of taste until it was proved that no man had ever possessed it; which is indeed true of taste in the abstract, for in the most perfect human works there exist flaws from the want of it, and which are, no doubt, always traceable to partial cultivation and the accidents of local position and evil associations. And if taste be the proper director of the imagination, it is also modified in its turn, in every individual, by the particular cast of the latter.

Ornamental Castings.

For small castings in metal, such as statuettes or works of an ornamental character, sand is usually employed to cast in. As this material has the advantage of allowing an escape of air, and its cohesive properties are so great as to admit of considerable liberties being taken with it during the process of moulding, it is generally preferred. Simple cylindrical articles are easily moulded, and it is only when there are figures, foliage and deep under-cuttings introduced that the operation is attended with difficulty. This difficulty consists in judging as to the number of cores to be employed. These the workman makes upon the pattern, removing them for the purpose of lifting the pattern out. The small pieces of sand or cores are then replaced, the mould dried, closed and held together, in order to receive the melted metal. When very great delicacy of surface or texture is desired, the ordinary sand has its capacity improved for receiving the impression by dusting upon it a very fine loam, and thereafter powdered or ground wood charcoal, the consequence of which is that the most delicate line, mat or chase is imparted to the sand matrix, and is in turn communicated to the casting. Patterns for ordinary plain work, either round or square, are made in the turning lathe, or by planes and chisels. Ornamental patterns of figures or foliage are in general first modelled in wax, from which a cast in lead or tin is taken. This cast is trimmed up neatly, and from it a cast is taken in brass, which is carefully smoothed up and chased. This then becomes the permanent pattern from which any number may be cast. Care and attention in this department is of the utmost importance in the economy of time, and to the ultimate perfection of the work.

The Study of Painting.

With apparently greater advantages than the world ever before presented, the young painter has many more real difficulties to contend with in the commencement of his studies now than at any former time. The very wealth of art creates one great source of embarrassment. The student is apt to be so impressed with awe by the works of the great masters now congregated in galleries, that any attempt to rival or combine their excellences seems to him to be utterly hopeless. He wanders through the public collections, admiring rather than studying what seem to him the productions of an order of beings that are never again to exist. He settles it in his mind that an approach to them will be happiness enough for him. His aim therefore is low from the first, and, as is always the case, he falls short of his aim, and dooms himself to mediocrity for life. This is the defect of one class of minds. Another class find it easy to imitate in a superficial way, but in a way sufficient to catch the admiration of superficial critics, the dash of art. They omit details, because great painters have done so; but they do not see that the very omissions of the great masters are full of slight and exquisite indications of knowledge which they have not acquired. They endeavour to grasp the end without being acquainted with the means, and though they may impose on themselves and the world for a time, the emptiness of their pretensions is sure to be discovered at last. It is in reference to the productions of such minds that old Richardson says, "there is bold painting, and there is also impudent painting." Another error, and a very pernicious and prevailing one, is sectarianism in art—the bigoted admiration of any one school or any one master, however deserving of admiration, to the exclusion of all the rest. There cannot be a greater mistake, for it has been remarked that he who pins his faith wholly on any one particular style is exactly he who least perceives that in it which is its peculiar charm. All the great masters throw light on each other, and no mind will thoroughly relish Raphael and Michel Angelo which does not thoroughly relish Rubens and Rembrandt. Nay, the simplicity and purity of feeling of Giotto, Angelico, and others of the early Italian masters will be best felt by him who is most sensibly alive to every variety of excellence that has been displayed by the painters of all ages of the world. A bigoted sectarian always admires in the wrong place, clings to what is merely accidental, to that which belongs to the time and country in which the painter has lived, and ever fails to perceive that which is essential in the style, that which is catholic, and which therefore connects all the first-rate minds of all ages with each other. It is this essence which is really the art; all else is but its dress.

Ideal Forms.

The ideal in form, it is agreed, is that best condition to which nature always tends, and from which in her individual productions she is only intercepted by accident. The accidents, however, that interfere with the perfect development of the human figure are, by the artificial habits of life, so much more numerous than those which operate on the forms of other creatures, that perfect adult human beauty is not supposed possible to have an existence in any individual, at least not in civilised society. And, indeed, were every natural condition there favourable to beauty, the wearing of clothes alone would prohibit perfection of form. Luxury, poverty, disease, the habits attending particular employments, and above all, vice, the parent of all real evil, are the chief destroyers of human beauty. We scarcely apply the word ideal to the forms of infancy, for we have every day frequent opportunities of seeing far more of perfection of form in young children than art ever has reached or perhaps ever will reach. Neither is the term applied to the form of any other animal than man, for we have no need in the representation of a beautiful horse, a bull, or a dog to consult either sculpture or painting for ideal types, as we can easily find better models in nature than these can supply. But for the best proportions of the human figure we must have recourse to Grecian art. And we must ascertain its principles, for the mere mechanical process of copying it, however it may help us to obedience of hand and correctness of eye, will never make us masters of form. Nor can the antique be studied to advantage without a constant reference to nature, otherwise we are in danger of becoming blinded to what it may have of mannerism and of learning to prefer those systematic deviations, not from individual nature, but from some of her invariable forms, which we find in many celebrated statues of antiquity, as, for instance, where a more arched shape is given to the lower margin of the ribs in front. We must remember also that many of the antiques we possess are but copies, the originals of which are lost; some may be copies of copies; many have hands, heads and limbs indifferently restored; and many, though fine works, are not the productions of the best ages of sculpture. How easily we may be led into mannerism if we do not, in imitating art, constantly refer to nature will appear from the example of Raphael himself, who in his horses, from a singular inadvertence, continued to follow the types of

the earlier masters, and the horses in the *Attila* have human eyes like those in the *Campo Santo*, and are in no other respect more natural. Indeed, the true form and character of the horse was not seen in modern art before Rubens gave it, whose animals generally are so superior to those of all preceding painters that he would have left a great name had he been known only as an animal painter. The beauty of the human, as of all animal, forms is in a great degree relative. The most perfect proportions of the woman are in some respects the reverse of beauty in the man, and the long body and short legs of the child would amount almost to deformity in the adult; and the same is, in a degree, true of grace. The attitudes of children are proverbially graceful; yet there are some proper only to childhood, and which would be absurd in elder life, as there are attitudes graceful in women that belong to them only. The slightly inward inclination of the knees in the structure of the female may be often increased with an increase of grace; but any such deviation from the straight line from the hip to the foot in man becomes disagreeable; and though the representation of peculiar characters may sometimes require us to give an effeminate structure to the man or a masculine one to the woman, this must always be at the expense of the beauty proper to each.

Egyptian Bricks.

Egyptian bricks were generally crude, mixed with straw and dried in the sun; kiln-burnt bricks were occasionally used in foundations, quays, the raised terraces on which the towns were built, or in any situation where they would be exposed to frequent contact with water. The crude bricks were about 15 inches in length, 7 inches in breadth, and a little more than 5 inches in thickness: this simple material was found to be peculiarly suitable to that dry, hot climate, where rain scarcely ever falls, and were further recommended by the ease and rapidity with which they could be made. The brickfields afforded abundant occupation for numerous labourers, and the demand was so great and the trade so profitable, that the Egyptian Government took it into their own hands and considerably increased the revenue by this monopoly. In order to prevent unauthorised persons from engaging in this manufacture, a seal containing the name of the king or some other privileged person was stamped upon the bricks before they were dried; numerous bricks, thus stamped, have been found at Thebes and elsewhere. According to Vitruvius, crude bricks should only be manufactured in spring or autumn, in order that they may dry slowly; those which are made in the heat of summer speedily dry outside, while the inside remains moist: the brick thus becomes defective and easily gives way. He further observes that bricks ought to have been dried five years before they can be considered fit for use, and that their having been so should be certified by a magistrate. If these rules originated with the ancient Egyptians, it is probable that the stamp before mentioned may also have been a warrant of the solidity of the bricks.

J. H. Mortimer.

The talents of Mortimer were prominent in his day, and generally directed to the higher objects of his art. King John signing Magna Charta and the Battle of Agincourt, of which there are well-known prints, afford no mean specimens of his strength in history, of his conception of character and his powers of composition. His mind seemed to partake in a great degree of that romantic cast of thought so conspicuous in Salvator Rosa. He delighted to represent banditti under all the circumstances which the mode of life pursued by these picturesque plunderers naturally suggests to a fertile imagination. But though he could exhibit the robber with success he wanted the powers of Salvator to place him in an appropriate scene. He was inadequate to express that wild grandeur of solitude, that savage sublimity of nature, where the ferocious and half-armed freebooter appears to be the characteristic inhabitant. The works of Mortimer in general show considerable skill in anatomy, and a well-grounded knowledge of the human figure in all its varieties of action and repose. He drew with great facility, particularly with the pen, which he used in a style of uncommon spirit and effect; his sketches with this instrument may be classed among the happiest of his productions. His forms are sometimes incorrect, but seldom vulgar; and though his characters are occasionally overcharged and exaggerated, they rarely fail to be appropriate and expressive. In the other parts of his art the merits of Mortimer are not equally conspicuous. His finished works retain but little of that vigour and spirit of execution which characterise his sketches. His oil pencil is tame and laboured, his colouring betrays no great sensibility to the beauties of tone, and his effects little scientific arrangement of light and shade. On the whole, however, his powers appear to have been of a superior class, and such as, under better regulation, might have raised him to the highest rank of competition. His productions were few and irregular; they were flashes of intellect which, while they dazzled by their own light, strongly impressed men with the brilliancy of that fire from which they proceeded.

NOTES AND COMMENTS.

THE name of JONATHAN SWIFT is associated not only with the squalid part of Dublin in which his deanery and cathedral stood, but with several country houses in Ireland. A small property known as Loughbrey Castle and demesne, within three miles of Stewartstown, in the county Tyrone, which was sold a few days ago, is one of the places distinguished in that way. In the grounds stands "Dean Swift's Cottage," and according to tradition a part of the "Tale of a Tub" was composed there. That Rabelaisian treatise on doctrine appeared in 1704, and it was serviceable to the High Church party of those days. But a book which VOLTAIRE could recommend to his followers was not a foundation for orthodoxy, and it lost SWIFT the mitre for which he longed. He never acknowledged the authorship, although his exclamation about the genius he possessed when he wrote it was evidence enough. TOOKE, the bookseller, was aware that SWIFT was the author, and FAULKNER, the printer, testified that the Dean informed him of the fact. PORSON'S discovery of the coincidence between a sentence in "Gulliver's Travels" and another in the "Tale" may also be considered as evidence. GULLIVER says he was confined by fourscore and eleven chains locked to his left leg by six-and-thirty padlocks, while in the introduction to the "Tale of a Tub" we read:—"Fourscore and eleven pamphlets have I writ under three reigns, and for the service of thirty-six factions." The Dean evidently forgot himself when writing one of these two sentences. The mystery that surrounded SWIFT does not impart much interest to his abodes, and we doubt if the cottage at Loughbrey was valued at a high rate by the gentleman who gave 8,300*l.* for the castle and demesne.

A VERY few months have elapsed since Mr. W. WOODWARD vigorously opposed the carrying out of the system of decoration that is in progress of realisation at St. Paul's. We are pleased to see that in disregard of a suspicion of inconsistency he now puts forth a scheme for obtaining aid towards the completion of the work. WREN was a zealous Freemason, and held high office. Accordingly Mr. WOODWARD offers the following suggestions:—"That every lodge in England forego one banquet this year, and devote to the decoration fund the amount which would probably have been expended on such banquet. That a grand Masonic ceremony, with His Royal Highness the Prince of WALES at its head, take place this year in St. Paul's to further direct attention to the needs of the cathedral, and to aid the decoration fund. That inasmuch as the contributions resulting from these efforts would probably not be sufficient to complete the scheme of decoration, a certain portion—say, the dome and the transepts—be set apart as that with which the Freemasons would be particularly associated, and that the work be completed before December 1897, the bicentenary of the opening of the choir for service." There would be no excessive self-sacrifice imposed on any Freemason by Mr. WOODWARD'S proposals, and it is remarkable that the remembrance of an ancient grand master's connection with the building has not inspired the raising of contributions at an earlier time.

THE President of the gas managers of Scotland, in his address, did not ascribe to the severe frost all the fractures in pipes which have caused much loss of money and inconvenience in the North. In many cases it might be the sole cause, but he was of opinion that generally partial fractures or defective joints previously existed, though from the open nature of the ground any escape was better able to diffuse itself, and therefore did not make its presence felt. The amount of damage that was caused to gas and water pipes will probably remain an indefinite sum. In Birmingham it was found necessary to lay 1,675 new lengths of pipes, for there were fractures in those laid under 176 roads and streets. Where the bursts had been numerous it was considered more economical to entirely relay the pipes, and this was done, the pipes in most cases being replaced at a greater depth. It was found in many cases that the pipes were not originally laid at a sufficient depth, and that, the level of the roads having been altered from time to time, the pipes had been brought too near the surface. The

expense is estimated at 15,000*l.*, which will mean an addition of 2*d.* in the pound to the rates. In London the inhabitants will not have to bear the cost of reparations unless in an indirect form, and that thought may lighten the inconvenience. The water companies cannot expect any commiseration.

SANITARIANS who visit Jerusalem are generally scandalised about its condition, and some thirty years ago the Baroness BURDETT COURTIS had a survey made with a view to a water-supply. The work was entrusted to an Irish surveyor and agent for sale of ordnance maps, Dr. IRWINE WHITTY. On one of his maps he indicated the position in which he supposed SOLOMON'S rampart once stood. The excavations of the Palestine Exploration Fund have revealed that the guess was a shrewd one, for the wall nearly coincides with the line laid down. While we are ready to give Dr. WHITTY all the credit which belongs to his feat, we must demur to his endeavour to have the ancient wall called "Whitty's Wall," although he believes that, whatever may be done, that name "can never be erased, never more while Zion's Hill and Zion's Wall remain in human thought, endeared to human memory, be craftily ignored, concealed, obliterated, or even tampered with." It is astonishing how easily a Celt believes he can become famous, and the craving after notoriety has done incalculable harm to Ireland as well as to France. We do not suppose that the excavators of the Exploration Fund were guided by Dr. WHITTY'S dotted line, or that it saved a shilling expense. If, however, he has served the cause he is only one among many zealous men who have toiled for years without any desire to have a temple, a sepulchre, or a wall called after them.

AN agreement has been entered into between the French Government and the Commune of Périgueux by which the chapel dedicated to St. JOHN will henceforth be recognised as one of the historic monuments of France. It is of much later origin than St. FRONT, as it was founded in 1521. But it has many attractions as a work of the sixteenth century. The building stands in need of reparations, the cost of which will now be shared by the State if not entirely defrayed out of the public funds.

THE exhibition at Athens, which is to be opened on the 28th inst., has been organised by the Société Biotechnique. Although intended only for native products, it will be accessible to foreign exhibitors of such articles as may assist in the development of Greek industries. All expenses will have to be borne by the exhibitors, who will, moreover, have to pay a tax of 2 drachmas for each article worth 100 drachmas. Articles worth more will be charged half a drachma per hundred in addition. The committee of the exhibition will sell the exhibits at a commission of 5 per cent. The exhibition will be open each year from March 13 (March 1, O.S.) to July 12 (June 30, O.S.), and from September 27 (September 15, O.S.) to January 27 (January 15, O.S.).

THE French Ecole de Rome, of which, as we mentioned last week, the Abbé DUCHESNE has been appointed director, must not be confounded with the school in the Villa Médicis, which is the goal of so many young students. The Ecole de Rome has a local habitation on the second storey of the Farnese Palace. There are only a dozen members, who have not to follow any courses of lectures in the establishment, for the school is without professors. Rome itself and its treasures are the objects of study, and the members are free to engage in any kind of investigation which they may consider advantageous. The office of the director is to advise them and to facilitate their researches. The school was founded in 1873, and at first there were only two students. One was the Abbé DUCHESNE, who is now director; the other was M. EUGÈNE MÜNTZ, the conservator of the Ecole des Beaux-Arts, whose scholarly works on the history of art are a testimony to the use he made of his opportunities in Rome. The Abbé DUCHESNE is no less eminent as an authority on history, archæology and philology, but his works are addressed to a more restricted circle of readers than those of his fellow student.

YOUTH AT THE MONUMENT OF HENRI REGNAULT.

AMONG the men who fell in the Franco-German War was HENRI REGNAULT, who although a young man, had attained a prominent place among French painters. His friends resolved to erect a memorial of him in the Ecole des Beaux-Arts, and permission was given by the Government. Afterwards the character of the monument was altered, in order that it might commemorate other students who were slain in the cause of their country. The dominance of the part relating to HENRI REGNAULT suggests the original intention. The painter's bust is placed on a stele, and La Jeunesse, or the representative of the subscribers, is shown as about to place a branch of laurel beside the bust. On either side are Ionic columns surmounted by a pediment, the whole being an example of French neo-Grec.

INDUSTRIAL ART.

AN Arts and Crafts Exhibition was opened in the Queen's Rooms, Glasgow, on Saturday. The place was decorated from a design by Mr. Rowntree, architect.

An address was delivered by Professor Baldwin Brown. He said that the exhibition was called an exhibition of arts and crafts, or they might call it perhaps an exhibition of home industries. These words—arts and crafts and home industries—represented a movement which had been going on for some time, and which had been productive of some very good results. The movement rested, he thought, upon two principles. The first was that it was of value in our lives to have a certain element of beauty and of interest in the objects of our immediate surroundings. He did not mean beauty and interest in expensive pictures and masterpieces of sculpture. He meant rather this element of art in the objects which surround us—our furniture and fittings and the material environment, if he might call it so, of our daily life. The second principle was that this beauty and interest in objects of this kind was best secured when they were not turned out by the thousand by machine, but made by hand, and so carried with them a certain mark of the individuality of the craftsman. He thought there was no need for him to offer any abstract arguments as to the truth of the first principle. He knew there were a great many who would controvert it, or, at any rate, did not see any force in it. There were many excellent people who were perfectly satisfied if their houses were warm and comfortable, and if the furniture and fittings served the purely utilitarian purpose which was their primary object, and who thought that this talk about beauty and art and that sort of thing was rather unpractical and nonsensical. Those people were best left to the quiet working of the sounder and more liberal ideas on this subject which were so very widely diffused now throughout the community. One had only to look at the works brought together in that hall, and to the interest which that show had excited and would excite during the time it was open in Glasgow, to feel that these sounder and more liberal ideas on this subject were certainly fully alive in our midst. The exhibition contained a great deal that was of first-rate artistic excellence, both in the matter of idea and design and also in execution. He had not the least doubt, however, that they would see a good deal that was not up to the first standard. Whatever the actual character of the exhibits looked at from the highest artistic standpoint, they might be sure that they were all done according to the right principle, and on the only principle he thought on which it was possible for productions of industrial art like this to be successful—they were all done by workers who had taken a real, a genuine, a personal interest in what they were doing. The workers had put a little of their own thought and of their own art into their productions, and had turned them out with a certain stamp of their own individuality upon them. There ought not to be anything remarkable in this. There would not have been anything remarkable about it in any other age of human history but our own. From the beginning of human history things made primarily for use were also made beautiful and interesting. Within this century, within the memory of some now living, that natural connection between art and objects of utility suddenly came to an end. The tradition stopped and began, they might say, to die away, and art and beauty became divorced from objects of utility; and where beauty and art were still to be found in objects of utility they were put there as something extra, as it were, for which often a considerable additional price had to be paid. In various ways attempts had been made to counteract the

tendency of the time and to restore as far as possible the spirit, if he might call it so, of artistic craftsmanship. These efforts had been partly official, partly private and sporadic. The great institution of the Science and Art Department was founded with this view shortly after the Exhibition of 1851, and that had established schools in every important centre of the kingdom, some of which, like the excellent school in Glasgow, had done, and were doing, very excellent work. Besides that, and nearer our own time, organisations had been established in various parts of the country for the encouragement of what he might call local handicrafts. Endeavours had been made to keep alive any particular artistic industry that had survived to this age, and where they had not survived to establish something of the kind. Still, he thought there had been possibly a certain defect in the system—he was speaking rather of the official system of the Science and Art Department—that had perhaps stood in the way of good which might have been done if another principle had been adopted. What he meant was that the Science and Art Department had been too pessimistic in the way in which it had dealt with ornament. It had looked upon ornament too much as if it were a dead thing belonging to the past, as if it were an independent thing to be used or let alone. There were two very familiar watchwords of the official publications of the Science and Art Department which exactly expressed this view, which he ventured to think, was in many respects an erroneous view. The watchwords were "historic ornament" and "applied ornament." He felt very strongly that whatever ornament was, or ought to be, it ought not to be looked upon as historic or applied. What he thought was that ornament should be treated as a thing that is alive and that grows, and should be considered as a thing not apart from the object adorned—not a thing that could be applied ready-made to an already ready-made object of use—but as a thing which should grow out of the material and the process; it should be in intimate and organic union with the object. A defect in our present system which, however, was being rapidly remedied, was that the designer and the workmen were too much apart. Instead of being, as they were all through the ages of the past, one person, they were now two. One, the designer, had got rather out of touch with the material and the process, while the workman on his part had forgotten that he ought to be, what he was in all periods but our own, an artist in his way as well as a craftsman. Designing was too much an affair of paper and pencil, whereas it should be done, he ventured to think, in the material and in close connection with the process by which the material was wrought. The truth of this was certainly seen in Glasgow, where there were workshops established in close connection with the school. He hoped before very long that no school of art or of design would be considered complete unless there was a set of workshops connected with it. In these workshops he should have a smith who could hammer iron, a silver worker who could beat up silver and a joiner who could put pieces of wood together. He would take the pupil down into the workshop and show him the capabilities of the material for which he was drawing a design. In that way he thought the designer would come to see that ornament really grows out of the character of the material and the process. He noticed the other day that a great traveller, Mrs. Bishop, had received a present of a collection of objects of art and industry from the King and Queen of Corea. He was quite certain that the objects produced there would be on the whole excellent in taste and colour, and in all essentials which went to make a pleasing artistic product. Compare that for a moment with the great collection of objects which ought to have been objects of industrial art which were on view a few years ago in the collection of jubilee presents to the Queen. He supposed in the whole history of the earth there was never such a collection of tasteless and ugly things brought together, and he trusted that under the altered conditions it might never be possible to bring together such a dreadful collection of things which were exactly what they ought not to be from the artistic point of view. There was really only one good thing in the collection, and that was a copy of the famous Roman fountain of the Renaissance. Why we had lost the tradition was that designer and workman were dissociated; and why the tradition was still maintained in far off regions like Corea was that the unsophisticated workman was still in touch with his material; he started from that and worked it. In this revival of artistic craftsmanship those who were not professional or non-professional artists had an important part. They had the onerous, but at the same time honourable, task of being paymasters. Unless there was encouragement for artistic work of the kind that they saw in part accomplished there there was no chance of the thing really flourishing in our midst. Hand-made work would necessarily cost more than machine-made work. But take the difference in value. It was simply infinite between a fine piece of hand-made industrial art and a piece turned out by a lifeless

machine. Moreover, a hand-made production was a unique thing; it could never be reproduced, and they had the advantage of having something that nobody else possessed. In the case of a machine-made production, every one of their neighbours could have the same thing by going to the same shop and paying the same price. When that was more widely realised he did not think that there would be any complaint of want of patronage for this new or—he would rather use the term—this revived, artistic craftsmanship.

Mr. F. H. Newbery proposed a vote of thanks to Professor Baldwin Brown for his address. It was, he said, a sign of the times that a professor of the fine arts belonging to a university such as Edinburgh should, in a spirit, he thought, as broad as the world, embrace under the word art all the crafts that the human hand was capable of accomplishing. Fifty years ago that would have been almost impossible. As far as the Science and Art Department were concerned they were the servants of the public, and while they would take no initiative, they would follow a lead. Men like Morris and Crane were their examiners. If they could get better men they should do so, but he was sure that the Department very gladly did what these men required. The Department was very squeezable just now. They had been sitting on the fence for a long time, but with the influences that were being brought to bear he had no doubt they would come down in a year or two on the right side.

THE ÆSTHETIC UNITY OF THE FINE ARTS— MORE ESPECIALLY IN RELATION TO ARCHITECTURE.*

IT is only necessary to preface my remarks by saying that I address you as an artist to artists, in the broadest and most catholic sense of the term; fellow-worshippers at the shrine of the beautiful in nature, who feel their dearest ambition is to capture a ray of her glory and crystallise it into some form of art, which may reflect its refining influence for the good and happiness of mankind and be an incentive to virtue and noble deeds.

In speaking of architecture it is not merely in its constructive sense of building, but the conception and creation of such edifices as claim to possess elements of grace and beauty, dignity and attractiveness, which should elevate the soul of the beholder and be a joy for ever.

God created man in his own image—body, soul and spirit—and the first mental activities the primitive creature put forth were to build his rude habitation, carve ornaments on the door-sills, colour them with rude pigments, and chant his dirge or war song. This imitative activity was the genesis of the arts of design; painting, architecture and sculpture, together with poetry and music—making the five sister muses of form, proportion, colour, melody and rhythm—the media by and through which the good and beautiful commune with the soul of man and satisfy his intellectual cravings. And are not these faculties intimately connected and associated with each other in their highest æsthetic fulfilment by some hidden mystery not yet revealed, the principle underlying each being one and the same?

An apt figure of the five sister arts, their intimate relationship and interdependence, suggests itself to the mind in the structure and vocal organs of the human body.

1st. The skeleton—that wonderful mechanical arrangement upon which all other parts depend, combining, as it does, economy, lightness, strength and ingenuity, suggesting the building or architecture.

2ndly. The outer covering, *i.e.* the muscles, giving the contour of form, beauty and motion, expressed in sculpture.

3rdly. The colour and texture of the features and the skin represented in painting.

4thly and 5thly. Speech and vocal sound, the organs of poetry and music.

Here, then, is the perfect model set up by the Divine architect, the synthesis of the fine arts, comprehending or embracing colour, texture, form, harmony, melody, rhythm and proportion—a living expression of the beautiful in mind and matter.

In the language of the immortal bard, "What a piece of work is man!—how noble in reason! how infinite in faculties! in form and moving how express and admirable! in action how like an angel! in apprehension how like a god!—the paragon of animals."

Before leaving the masterpiece of creation as the type or ideal model of beauty, examine for a moment his component parts. The osseous structure called the skeleton, marvel of economy and strength for the burden imposed upon it; the cranium, with its dome and arching brow, exquisite precision of sutures that join the skull; the vertebræ, ribs, pelvis, con-

dyles of the limb bones, with their perfect ball-socket joints. Here is fitness and utility, though not necessarily beauty, yet models for the builder and mechanic in this age of steel.

It is when we consider the myology or muscles that life and beauty are apparent, and both architect and sculptor have been inspired with the perfection of form for their models. The design of the Greek and Roman mouldings is evidently inspired from the profile of the face, mouth and chin; the gently expanding and tapering columns from the limbs; the groining of the ear, chiselling of nose and nostrils, have also influenced design in architectural forms. In woman, though less powerful than man in structure, the still more graceful curves of form present a veritable incarnation of unspeakable loveliness. Thus we see form in its highest type, which receives its consummation in its texture or outer covering, the skin, the human epidermis; as seen on the cheek of a beautiful woman, combining and blending, as the painter learns, every delicate and luscious tint with the bloom and down of touch—a setting indeed for that incomparable jewel of all, the eye—the soul's window. In colour and texture added to form, we reach the absolute, the highest æsthetic ideal of beauty. This trinity in unity of colour, texture, form (form including proportion), constitutes the essential and inseparable elements which the master builder has incorporated, and shows the relation and dependence of each upon the other to express a perfect *ensemble*, each of the links being a *sine qua non* to the success of the whole, and without which neither the sculptor, painter, architect nor poet can create his airy palaces or portray his themes of lore.

Bulwer well appreciated this unity in the elements of the beautiful in Claude Melnotte's description of the home to which he would take his bride could love fulfil its prayers. "A palace lifting to eternal summers its marble walls from out a glossy bower of coolest foliage; musical with birds, whose songs should syllable thy name . . . while the perfume lights stole through the mists of alabaster lamps, and every air is heavy with the sighs of orange groves, and music from sweet lutes and murmurs from low fountains that gush forth in the midst of roses."

What is the principle in design that predominates in the human form and runs all through nature? It is a succession of curved lines of varying length, entirely free from harshness, producing to the senses a feeling of blending, melody, buoyancy and harmony.

Beauty's wave in human form,
In rose or lily, bird—
In womanhood transcends all things,
'Twas always so, I've heard.
'Twas so in ancient days, when Art
Sat graceful on her throne,
And gave her sons that curious line
True artists love to own.

The religion of the ancients required a habitation in which to worship their deities and store their *lares* and *penates*, and from the four walls of mud and wood, or brick or stone, grew the temple. Ornament, columns and capitals were added; then the gable broke the monotony of the horizontal. Colour followed. The beauty of texture was absent, till marble or an imitation filled the want. Still life was not there—human life. At length the sculptor's chisel and painter's brush filled the pediment with the deed of heroism, and enriched the walls with polychrome. Finally the temple became a work of symmetry, power and beauty; every member was studied with regard to optical value and refinement—carving, gildings and tinting drank in the glorious hues of the prism, which shone resplendent upon its harmonious proportions.

The life of action and deed of valour were implanted there in the metopes and friezes. The magnificent quadriga and acroterium statues adorned the angles. Caryatides took the place of columns; finally the temple became clothed with the matchless genius of Phidias and Apelles—fit habitation indeed for the crowning glory within, the shrine of the god Zeus or Athene in chryselephantine. Gold, ivory and precious stones; what would Homer have said had he seen these wonderful achievements in art?

It was centuries before he sang of the god:—

He said and nodded with his shadowy brows;
Waved on the immortal head the ambrosial locks,
And all Olympus trembled at his nod.

Remember, it was not the intrinsic value of the material that made the masterpiece. Its value lay in its incomparable embodiment of benign beauty and sublime expression. The genius of Phidias, appreciating the importance of æsthetic unity, at once saw that even marble failed, beautiful as it was, to fulfil the highest ideal of texture as representing the flesh, and so chose ivory, which of all material bears the closest resemblance to the human epidermis. White marble is beautiful when fresh from the chisel, but without great care soils and loses its appearance, till old age or time has turned it into the colour of ivory, like the Venus of Melos in her hallowed shrine

* A paper read by Mr. Hamilton MacCarthy at the fifth annual convention of the Ontario Association of Architects, and published in the *Canadian Architect*.

in the Louvre, or the memorials of old gold hue such as are seen in Westminster Abbey, or the Elgin Marbles from the Parthenon and now in the British Museum—the latter cut 438 B.C.

The true artist or *dilettante*, who has drank the nectar from those gods of form and beauty, Phidias, Myron, Scopas, Polycleus, Praxiteles and others, of the age of Pericles, can only contemplate their works with wonder and fascination at the supreme mastery gained by these sculptors of the human form over their art, yet mingled with regret that so few examples have escaped the hands of the iconoclast and the ravages of war.

We who have worshipped at the feet of Hermes, Aphrodite, the Discobolus, the Gladiator or the Illisus, or the other masterpieces that adorn the Parthenon, feel that this is not the occasion to enter upon the various merits of the works of those great artists. They have been of incalculable value to art and history. They tell the story of their age. We acknowledge them to be the absolute and immutable standards of physical beauty, the ideals for the artists and *dilettanti* of the world.

The pediment of sculpture expresses at once grandeur, power and life, and it is to be regretted that architects of the Victorian era have not been more inspired with the use and possibilities of statuary—the most profound and longest enduring form of art—especially in connection with public buildings and monuments, in which the nation's history should be indelibly written.

And how have we of the eighteenth and nineteenth centuries treated the Classic orders? These forms of architecture have been largely used for public buildings, both in Great Britain and America, but what relation have they borne to their ancient prototypes? Where are the sculptured pediment, frieze and metopes of beauty and action, once instinct with life and imagery, the tinted walls and coloured story? They have departed; the sheen of the rainbow has gone from the Classic mouldings; texture of marble, mosaics, encaustic and polychrome, all omitted; Phidias and Apelles are banished; the temple has fallen. The diadem has been torn from her brow, the jewel from her breast, the robe of beauty replaced by sackcloth and ashes. The skeleton alone, in dingy grey or blackened stone, is all that remains to us moderns to help us to imagine we are beholding a noble Greek or Roman columnar edifice and to enthuse about. Surely an anachronism in art.

With the extravagance and luxury of imperial Rome the purity and beauty of Greek sculpture were lost, and with Rome's final destruction all art was extinguished, except that of the monks.

From the Byzantine and the basilica evolved the Gothic, an entirely new departure. No doubt the minaret was the progenitor or archetype of the spire and tower; but the principle underlying this remarkable revolution from an æsthetic point of view was the overthrow of the rectangular in art. The temple, shorn of its sculpture and colour, is heavy, uninteresting and depressing, and its minor ornaments, though chaste, are monotonous and severe.

Both in plan and elevation the disposition of the masses of material in the Gothic, being modelled more after nature's ideal of form, is a blending of harmonious lines pleasing to the eye. There is nothing in nature suggestive of the rectangular. The luxuriant plant-life ornament of the Early English, the clustered columns, trefoil tracery, graceful arches and groined chapels, those lofty spires, seemed to break through the burden of earthly cares, and carry up with them like incense the prayers of the Christian in worship of the true God to the very feet of heaven. "Lift up your heads, oh ye gates, and the King of glory shall come in." This was the spiritual significance of the Gothic, and it became clothed with at least earthly glory.

Colour and texture were added to form. Marbles of every tint, mural paintings, mosaics, the sculptured niche and statues—everything that wealth and art could bestow to render the habitation of God a dream of heavenly beauty. "Gloria in Excelsis Deo."

In the revival of art and learning in Italy, sculpture and painting again took their place as a power in the world. Æsthetic unity and harmony of design were insured and rendered more potent by the fact that, in so many instances, painting, sculpture and architecture were combined in the work of the same artist.

The Florentines were quick to appreciate and express their joy on the dawn of renewed artistic life. When Cimabue first taught the world to paint anew Florence proclaimed a public holiday in honour of his masterpiece—for St. Maria Novella. Nicola Pisano, Giotto, Brunelleschi, Donatello, Della Robbia, Ghiberti and other architects, painters and sculptors, the progenitors of the Renaissance, brought their genius and devotion to bring about the fuller perfection which culminated in Raphael, Correggio, Da Vinci and Michel Angelo, the four pillars or archangels of that great epoch of art, and terminated in Cellini, Tintoretto, Titian and Paul Veronese, masterful exemplars of the mundane magnificence of Venice.

The Italian revival affected the purity of Hellenic form, but it accomplished something greater—it portrayed not merely

the perfection of sensuous beauty in the form or sublime grandeur of the gods; the teachings of Christ were expressed in human sympathy and love, devotion and adoration, at the gift of God in his Son, and the struggles and throes through which man is passing to attain eternal life. What a joyous note of hope, of harmony, of sentiment, of love and adoration was theirs—Pisano, Giotto, Donatello, Della Robbia, Ghiberti.

Religious faith was the stimulus which inspired their genius and devotion. How much is art indebted to these sculptors of the early Renaissance?

In the conception of a noble edifice the architect has crossed the border line of a mere building, *i.e.* a huge cube with holes to admit light and entrance, and entered the domain of the painter and sculptor. Form in its first stage, *viz.* the handling and arranging into harmony of the gross masses or masonry, so as to bring about the greatest effect of beauty and proportion, realising a noble outline or form in the gross. The carver must now join him in decorative enrichments to make the work interesting and repay closer inspection—form in detail or abstract, still only ornament. The sculptor then takes him to a higher plane, with emblematic or symbolic figures, in *basso* or *alto* *relievo*, or round attached form in transition, in which the walls gently breathe the story or mind of the building, its history or purpose. No form of art is more profound than these children of the mist emerging from fancy into reality—form in the first stage of statuary.

Every building of importance should be treated in this way, and would therefore be an object lesson and work of interest for ever, not only to those who see it many times, perhaps every day of their lives, but also to the stranger; the most emphatic record of civic or national achievements, events or progress.

The Reformation gave the death knell to sculpture and ornamentation for a time in Protestant countries, till a church became bereft of all beauty. The Gothic was treated similarly to the Classic, shorn of its art, the shell only remaining, and all art suffered in consequence.

How sad it is to look upon our cathedrals in brick—not in form, but, alas! in texture and colour. It is only during the last quarter of this century that we are beginning to awake from this iconoclastic superstition and believe that we can worship God "in spirit and in truth," and at the same time beautify his house with tinted walls and stained-glass and other decorations.

Freedom and toleration are the spirit of the age, and the impulse in art is to discover something new and best adapted to our surroundings. In architecture we are in a state of transition, if not of chaos, and in danger of degenerating into confusion and ugliness. It is this critical stage that affords the opportunity for our architects to create a style that, while retaining all that is beautiful in the heritage of the past, will meet the requirements of the climate and be distinctly national in character, ornament and expression.

Form is the first element of the beautiful in æsthetics, and influences everything we see and hear in nature and art, from the throat of a nightingale or a Patti, the melody of a Stradivarius, to the acoustics of a building, and should be the object of study from the lowest step to the highest pinnacle of a structure. In a wider sense it also affects the laying out of streets, parks, squares and gardens; the selection of a site, the raised plateau or eminence, grandeur upon which important edifices may be erected; the fountain, steps and terraced walk, with sculptured vases and ideal statuary, such as we see at the Crystal Palace, Versailles, the Tuileries Gardens, or in Edinburgh. All are form perceptible to sight and touch, and instinct with life and power to give us joy and elevate our souls, improve our manners and relieve our daily burdens.

The modern Romanesque does not impress you with a sense of grandeur or beauty. Its basket-work ornament, unlike the longer and more graceful Gothic plant life, is indefinite and confusing, and with the horrible heads of animals called "grotesque" is barbarous. It no doubt originated in the early stages of inability to imitate life better. It is unfit for a woman to look upon, and should be banished from the front or any part of a building where the lesson of beauty should be presented. There is a place for the conventional, but as little of it as possible. The lamp of truth in art has been extinguished so many times by wars and puritanism that form still goes on crutches in the respect of carving and sculpture.

Foliage, fruit, flowers and other imitations of organic objects should keep as close to nature as possible to be of interest, due regard being paid to the nature of the material employed. Organic nature should be more largely drawn from for objects of ornament, and executed in the fulness of its natural beauty. The divine sculptor has furnished us with many noble and beautiful examples for imitation, to wit, the lion, the tiger, the horse, the ox, the ram, the hound, the deer and gazelle; the eagle, the swan, the dove and other birds; the dolphin, the nautilus and other denizens of the deep. Many of these are symbolic; all are grand or beautiful, and as ornament in appropriate positions would be of far greater interest than conventional scrolls, and serve to remind us of the wonders of nature.

The higher stages of sculpture proper, viz. figure subjects in relief and the statue, or group in the round form, may be termed the "lamp of life," and provision should be made for each of these forms in every building which claims to be a work of architecture. The relief has been described as the shibboleth or watchword of art, and has a philosophy peculiarly its own. It is specially adapted for emblematic figures, filling spaces in the architecture, and for special subjects in the history of the institution to which the building is dedicated, on the exterior or in positions where painting is undesirable.

The entrance and inner halls, vestibule and staircase, are suitable for natural or emblematic statuary, brackets for busts, and niches for statues of the genus loci, founder or benefactor, care being taken by the architect that light is provided at a suitable angle for both night and day.

The highest stage of sculpture has no necessary connection with a building, unless from local circumstances. It is reached in either the group or solitary figure, expressing an abstract motif, an emotion or passion, or any of the higher attributes of our being, or the elements of nature which may bear personification, or in national monuments where philanthropy, statesmanship or patriotism are commemorated.

The next important member of the æsthetic trinity is colour, and when we consider the share this element occupies in the book of nature—how generously the Almighty has decked his creatures—whether our wondering upturned eyes gaze into the infinite azure of the brave o'erhanging firmament fretted with golden fire, the jasper of the vasty deep, the carnation of the rose, the pallor or orange of the lily—each with its spiritual significance and relation to form and sound—we recognise at once the length and depth and breadth of his boundless generosity in this particular gift, and we marvel how it can be possible that in the nineteenth century man should, even in his most joyous and festive moments, clothe himself in black from head to foot—a colour that is always alluded to in terms of horror and associated with our worst enemy, and one that is the least seen in nature's kaleidoscope.

Colour is nature's life and light and joy-giver, and when its presence is withheld from us, our spirits are in like measure depressed. To speak of her riches requires the rhapsody of the poet; to comprehend her glory the eye and wings of the eagle, to carry us to the floor of heaven. The painter is privileged to penetrate her hidden mysteries and capture the fleeting subtleties of her ever-changing moods.

In architecture the scheme of colour decoration should receive the most careful consideration and be in relation and conjunction with the carving and ornament in form. In all important buildings spaces should be provided in the halls, staircase and ceilings, arches and domes, for special frescoes by artists of ability, affording opportunity for tableaux of prominent incidents or scenes in the life of the country, in alliance with the objects of the building. By this means the skill of our eminent painters could be utilised for the education, happiness and intellectual enjoyment of the people. Stained-glass, mosaic, furnishing and lighting should all be included in the one scheme of design, and require the same mind and care in their use, the cardinal virtue of all decoration being strictly observed, viz. the securing of cluster and space and repose, so essential in art.

In order to effect a complete æsthetic harmony, texture—its substance, or rather, material—has to be considered, which, of course, is involved so largely in colour that the one can hardly be discussed without the other, bearing, as it does, the same relation to form as form does to sound. The ancients saw the importance of producing colour and texture, and where costly marbles could not be procured, the artificial substitute approaching as nearly as possible to the semi-transparent beauty of marble was provided. Stone is the next best material, especially for carving, but cannot be relied upon to stand climatic influences, besides not fulfilling the highest æsthetic requirements. Brick as it has been used is an abomination, but we are glad to see improvements taking place in its manufacture. Greater size and neutrality of colour, combined with a soft or egg-shell glaze, may render it much more acceptable.

In the brief remarks the present opportunity has afforded me, I have endeavoured to show the important place form occupies in the elements of the beautiful, especially in its pre-eminent phases of architecture and sculpture, and the influence it must have upon the dignity and attractiveness of a city of learning, art and culture, and as the medium of expression of a nation illustrious in noble deeds and beneficence; yet I feel the fringe only of the subject has been approached.

Before concluding this paper, I venture to call attention to two or three matters seriously affecting the beauty of our city, and which constitute an outrage to good taste and common sense.

1. The dangerous and unsightly trolley, telephone and electric-light poles, wires, &c., which should never have been erected in a city like Toronto.

2. The want of public squares tastefully laid out. The objectionable mode of taxing lawns at the side of residences.

3. The disposition to build up our principal corners to an angle instead of to an octagon or circus.

4. We are now erecting municipal buildings of a costly character, and if the system of building without regard to beauty is allowed to continue, the view as you ascend Bay Street will be narrowed and the court-house dwarfed by some enterprising merchants. Such a course would be worse than a blunder, and should not be allowed to take place at any price.

Many other points in connection with the æsthetic welfare of our city demand immediate attention. What is required to prevent future mistakes, and perhaps rectify past errors, is the appointment of some central authority, such as a city architect or Minister of Public Works, to prevent the erection of unsightly buildings, and preserve important open places as gardens. Such a person or board of control should be appointed for their known taste and abilities, and they should be backed up by an association of *dilettanti*, both professional and lay, who would carefully guard the æsthetic interests of the city, and render it the pride of her inhabitants, the admiration of its visitors and the envy of other cities.

Brethren in art—as the genii and guardians of the beautiful in all that concerns the artistic progress of your country and the cities in which you dwell, you are called upon to devote your talents, your love and your watchfulness to her service; to bind yourselves together in the brotherhood of art, for her defence; for the vanquishment of the Philistine and the utilitarian; for the prevention of errors and incongruities, outrages to taste and beauty, frequently occurring, and which now threaten irreparable injury to the few remaining places of interest in this city; that you apply your genius to the development of a distinctly Canadian architecture, suitable to the conditions of the country, and upon which shall be implanted in sculpture and painting the romance and lore of her history, the valour of her sons, the beauty of her daughters and the industry and resources of her people, together with the picturesque grandeur of your scenery and skies—notes of harmony and patriotism which shall shed lustre upon your country, inspire the poet, the musician and the historian, and earn for yourselves a niche in the eternal temple of fame.

POINTS ON ACOUSTICS.*

ACOUSTICS, the science of sound and hearing, it is to be regretted, is but dimly understood. We are groping around in the dark, following a will-o'-the-wisp that we seem seldom able to catch, and when we do catch it it appears more by chance than by a previous certainty of scientific fact.

Instead of using acoustical science as the primary basis in constructing the design of a public speaking place, we too often leave it to a mere secondary place, letting it take care of itself, and apologising for bad acoustics by an artistically proportioned or decorated interior.

In this paper I shall not delve into theory but rather glean over some of the principal points in practice. In designing a church, theatre or public hall the first consideration should be proportion, length and breadth, with galleries to seat our required audience, and proportionate height of ceiling to accommodate all. Saunders's experiments give as a result that an ordinary speaker in the open air on a still day may be heard distinctly 92 feet in front, 75 feet on each side and 31 feet behind. Wren, however, claims less—his observations giving 50 feet in front, 30 feet on each side and 20 feet behind. It will thus be seen that the circumscribed area will seat roughly about 1,000 people. This area being enclosed and galleries inserted, as many as 2,000 persons might be accommodated, and allowing for conduction and retention of the sound waves, we might increase the area to accommodate 4,000 or more.

Large buildings may roughly be divided into two classes—(1) those in which the audience hears by direct radiation only, such as theatres or music-halls, when high shallow rooms are advisable; (2) those in which the audience hears by conducted radiation, such as cathedrals or other large churches without galleries, when long low buildings are best. In either construction it is bad policy to have the auditorium contain any more air than is absolutely necessary. The more air there be, the more vocal exertion necessary to set it in vibration, and for ventilation have good quick circulation, preferably from the speaker to the rear, or what is still better, use the "plenum" system, which is exceptionally good, on account of the heavier sound wave produced in the slightly condensed air.

In designing an auditorium to seat a given number of persons, a certain floor area is required, but how to divide this required area into main floor and galleries to come within a

* A paper read by Mr. David Gunn Baxter before the Ontario Association of Architects.

proper proportioned width and length, and what shall be the contour and height of ceiling are indeed vexed questions, calling for a great deal of personal observation and ingenuity; bounded by no iron rules, governed by few fixed laws, affected by the restrictions of site and finances, these limitations, together with the whims and caprices of the proprietors, make the problem to the architect indeed a difficult one.

For lecture and schoolrooms a height of 2, depth of 3 and breadth of 4, has proved extremely satisfactory, the speaker being on the longest axis. For small churches, court or other rooms, where the speaker is on the shortest axis, a height of 1, width of 2 and depth of 3, has proved good.

On account of the nodal points established by the columns in nave and aisle churches, a length of 4 to 5, width of 2 and height of 1 to 1½, works well; this is for cubical contents, but on account of the lower ceiling in the aisles the nave ceiling may be greatly increased in height over the above proportions. On account of limitations of site no definite rules can be given for theatres—generally speaking a height of 3, breadth of 4 and length of 5, is satisfactory. Many successful Chicago theatres are of this proportion.

In all buildings for public speaking, except perhaps cathedral churches, floors should be constructed on the isacoustic curve plan, straight slopes being as bad for sighting as a level floor, and if anything worse for the passage of the sound curves.

Ceilings greatly affect sound. Where flat, they should never join the walls at right angles, but in sweeping curves or coves, and are best lightly panelled. Skylights, if introduced, should have a sash at the ceiling line to cut off the contained air, which, starting in a sympathetic vibration of its own, would cause an echo, or if not, would form an eddy, much to the detriment of the free passage of the sound. If possible, it is well to bring down the ceiling on a regular curve or jogging slope, as low as possible above and behind the speaker. This considerably reduces the volume of air to be set in motion, eliminates all chance of echo caused by the eddying of sound vibrations at this point, and directs the waves out into the hall. In theatres a line should be drawn from the top of the proscenium arch to the top of head room over the highest gallery at the rear wall, and the ceiling kept on this line, of course not a straight slope; cut the ceiling up into steppings, coves and panels. This helps artistically, and also breaks up the continuous reverberation which would cause echo from the rear wall. It is also advisable to have theatre ceilings follow the curve of the proscenium arch for some little distance out, at least as far as the last box. Vaulted ceiling churches are exceptionally good for speaking in. The ceiling breaks up continuous vibration, and the columns help to direct the sound forward by forming nodal points on which the sound curves turn.

Walls have no mean part to play in the acoustical properties of rooms. They should always be broken with slightly projecting pilasters or shallow recesses. In theatres it is advisable to draw in the walls at the boxes at an angle of, say, 45 deg. or even longer; this contraction at the proscenium, together with the sloping ceiling, gives the interior a speaking-trumpet or funnel shape, which is extremely easy to speak in. Like the expansion of the circles produced on still water by the dropping of a pebble, so also do sound waves expand as they recede from the speaker. In addition to this all air-space is cut off where it is not required and where lines of sight die out; the less air to be set in motion, the easier it must be on the speaker.

Galleries are never good when of excessive projection; the greater the projection the higher they should be. The ceiling underneath and the floor below should on section be shaped like a wedge, not generally as is the case, small end out and big end in, but with wide end out and narrow end in, thus counteracting the absorption of sound by the soft clothing of the audience and the gradual lessening of power in the sound as it recedes from its source. Besides, this shape is a great gain in structural strength, the only objection being, of course, ventilation, which is extremely hard to perfect in this construction, especially if the gallery be low.

The proper location for the choir in non-ritualistic churches is hard to arrive at and varies with whims of the proprietors altogether too much. In front and below the preacher is not admissible for several reasons. They should not be behind him and on nearly the same level, for a great deal of effect is lost from the discourse by the preacher being surrounded by a halo of beaming femininity; therefore I incline to believe that a choir is better when raised up above the speaker's head and placed in a groined recess. This form raises up the volume of choir sound above the heads of the congregation, and there being a recess, the tendency would be for the sound to travel in a greater volume and farther ahead.

In designing ritualistic churches care should be taken that the chancel arch does not project more than a few inches on each side of the walls on the chancel side. If the chancel width be contracted very much at this point, the sound therefrom will be greatly muffled and appear flat and dead.

The orchestra in theatres should receive careful consideration. Around it resonant materials should be used, and the shape must be such that the sound will be directed up and out over the audience.

All buildings present obstacles and auxiliaries to the passage of sound, and the direction of it properly over the audience. In designing auxiliaries can often be introduced, but as they are of doubtful result—doubt not only as to their proper working, but that they will not prove formidable obstructions—it is advisable to discard all experiments thereon and confine our attention to the elimination of as many obstacles as possible.

A great deal might be said about what materials are best to use on the surface of our work and what are not. Thin pine boards in long lengths are exceedingly good; or in plaster-work I know of nothing better than "adamant," on account of its extreme hardness and uniform elasticity. Any soft covering is never good, as it deadens sound by absorption. Walls and ceilings vibrate in unison with the vocal chords of the speaker, and any lining which is resonant and elastic enough to keep up a sympathetic vibration throughout the entire wall or ceiling length is only admissible for use, preference being given to such materials as are capable of sustaining or augmenting the vibrations. Again, in rooms where an echo is perceptible while the room contains its full capacity of auditors, a judicious use of drapery or curtains will generally remove it. If these be not admissible, then some soft surface covering over that part or surface which causes the trouble will have the desired effect.

In rooms where the acoustical properties are poor, to improve them resonant materials for walls and ceilings are usually good in result; often only a sounding-board behind and above the speaker will have the desired effect, or it may be necessary to change the shape and contour of the walls and ceiling.

THE PORTRANE ASYLUM.

THE following memorial of Mr. Kaye Parry has been addressed to the Council of the Royal Institute of the Architects of Ireland:—

The Memorial of W. Kaye Parry, M.A., F.R.I.A.I., Architect, of No. 35 Dame Street, Dublin.

Saith:—I. In common with fifteen other architects in Dublin, I, on or about the 12th day of August, 1894, received a letter from the Board of Control of Lunatic Asylums in Ireland, asking me to prepare and forward designs and estimates for a lunatic asylum, to be erected and built at Portrane, in accordance with certain printed conditions contained in said letter, and a blue book of "Suggestions and Instructions," which accompanied said letter, and it was therein stated that all said conditions would be rigidly adhered to and enforced. I refer to a copy of said letter, and the "Suggestions and Instructions" and conditions mentioned.

2. Pursuant to said letter and conditions, to which I agreed by letter dated 13th August, 1894, addressed to the Board of Control of Lunatic Asylums in Ireland, I, at great expense, prepared designs and estimates, to which I devoted considerable time and labour, and these designs and estimates were duly forwarded by me to the Board of Control on the 31st of December, 1894. My motto was "Mens Sana."

3. Some day prior to January 12, 1895, all said designs and estimates were submitted by the Board of Control to a committee of selection, consisting of—

- (1) George T. Hine, architect, F.R.I.B.A., London.
- (2) Sydney Mitchell, architect, Edinburgh.
- (3) Dr. James M. Moody, medical superintendent, London County Asylum, Cane Hill, Surrey.

And the function of this committee (as per the conditions) was "to select from the designs sent in to any number not exceeding three which they consider of merit, placing them in the order of merit;" and it was a condition that certain specified prizes, namely, 100*l.*, 75*l.* and 50*l.*, would be given for the designs placed first, second and third respectively by the assessors, while the authors of all other designs should each be paid 35 guineas, but the "premiated designs" were to become the absolute property of the Board, who reserved to themselves the right to adopt any of them or none at their discretion.

4. After the report of the committee of selection hereinafter referred to had been received by the Board of Control (but prior to any adjudication thereon), namely on January 12, 1895, I received notice from the Board of Control that all designs sent in would be on public exhibition at the Royal University, from January 15 to 18, 1895, and said exhibition duly took place and was open to all. I am informed and believe that during and after the exhibition the names of the competitors and their particular designs were well known and freely canvassed. I submit that no exhibition should have taken place until "after adjudication" by terms of the conditions. I refer to a copy of said above-mentioned notice.

5. On January 28, 1895, I received a letter from the Board of Control, dated January 26, informing me that three designs, of which mine was one, had been selected by the committee of selection, who bracketed them together as possessing "equal merit," and I refer to a copy of said letter. But, contrary to the conditions, the committee seem in framing their report to have entirely ignored the question of the sufficiency or otherwise of the estimates of the competitors or "excess of cost," and said report contains no reference whatsoever thereto. Subsequently said three designs were, as I am informed, submitted to a local firm of surveyors, who were asked to report on the cost of the buildings, and at this time the names of the authors of the selected designs had been published in the daily papers, having appeared on January 24, 1895.

6. The surveyors' report was received by the Board on or about February 7, and was thereupon forwarded, together with the report of the committee of selection, to the Board of Governors of the Richmond Lunatic Asylum for the purpose, as it would appear, of ascertaining their views on the three selected designs. I submit that this proceeding was distinctly at variance with the spirit of the competition and the express letter of the conditions, as the competitors were not informed at any time that the Richmond Board would be so referred to at all, and, in addition, the identity of the competitors was then known.

7. The result of the reference in the preceding paragraph mentioned was, as I submit, the practical transference of the final decision to the Richmond Board instead of the Board of Control, the former Board being unable to bring any technical knowledge to bear on the designs, and thereby introducing into the competition a most objectionable personal element, as the authors of the designs were then known. The Richmond Board reported in favour of one design entitled "Aspect," and that the most costly of the three selected designs, notwithstanding the fact that "material excess of cost beyond the necessary outlay" was laid down in the conditions as a ground for disqualification, and one of the "chief points" enjoined on competitors was "economy of construction" and "economy of working supervision and future extension."

8. On March 7, 1895, I wrote to the Board of Control asking them to take steps to have my design placed in order of merit, pursuant to the conditions already quoted before any decision was arrived at, but beyond a formal acknowledgment, I never received any definite reply from the Board. Again, on March 21, I instructed my solicitors to write to the Board on the same subject, and they too merely received a formal acknowledgment to their letter of that date. I say that my design was never placed in its proper order of merit, as stipulated. I refer to copies of the letters above-mentioned as containing the grounds on which I then relied as entitling me to have my design placed in order of merit.

I submit that I am and was entitled to have my design placed in its proper order of merit; and this before my identity was revealed or any decision had been come to by the Board of Control.

9. On March 21, 1895, I received a letter from the Board of Control, informing me that the design "Aspect" (namely, that which the Richmond Board approved) had been accepted for the proposed works at Portrane, and that the total prize money of 225*l.* mentioned in the conditions would be divided among the three selected competitors equally, giving them each 75*l.* (save the successful competitor, whose prize would merge in his fees), the result being equivalent to a second prize to each. I submit that the three selected designs being bracketed by the committee of selection as equal, fairly entitles each of the authors (under the conditions) to a first prize, viz. 100*l.*

10. In the *Irish Times* issue of March 25, 1895 (to a copy of which I refer), an article appeared in which the circumstances attending the contest were reviewed, and it there appears that the author of the successful design was permitted to alter and amend his design so substantially and materially that the surveyor's estimated cost thereof was reduced by 40,000*l.*, or alternatively, by some very considerable sum, but a like privilege was not extended to the authors of the other selected designs, though these were pronounced of equal merit with the successful design. I submit that this procedure on the part of the Board of Control was irregular, and a breach of the meaning attached to the conditions by the competing professionals.

Your petitioner prays that the Council will take the facts and documents mentioned in the foregoing memorial into their careful consideration, and reply to the following queries for the information and guidance of the memorialist and the profession of architects generally, as involving matters of grave professional importance.

Replies of the Royal Institute of Architects, Ireland, to the Questions contained in this Memorial.

Q. 1. Were the assessors justified under the conditions of the competition in bracketing the three selected designs, instead of placing them first, second and third respectively?

A. No. We do not consider this was an adjudication in the terms of the conditions.

Q. 2. Should the competitors' estimates have been examined and checked by the committee of selection before reporting? And was the omission to do so a material irregularity?

A. Yes. Yes.

Q. 3. Were the Board of Control justified in accepting or in any measure acting on the report of the assessors under the circumstances, or should they have referred the report back to the assessors, and requested them to examine the estimates and place the selected designs in their proper order of merit?

A. No. Yes.

Q. 4. Was it in accordance with the spirit of the conditions, that the estimates should be examined and checked by a firm of surveyors, instead of by the committee of selection, and if this examination was admissible, should it have been made after, instead of before, the names of the authors had been made public?

A. No. Checking of estimates is an essential and indispensable element in adjudication by them. It would be, of course, open to the Board of Control to refer to surveyors for confirmatory estimates after adjudication by assessors. Examination should have been made after the names of authors were made public.

Q. 5. Are the authors of the selected designs under the conditions each entitled to 100*l.*, the value of the first prize?

A. (See reply No. 1.) There being no adjudication, according to the terms of the conditions it would be impossible to answer this query.

Q. 6. Was the reference by the Board of Control to the Board of Governors of the Richmond Asylum consistent with the spirit of the competition and with the conditions—whether it influenced the ultimate and formal decision of the Board of Control or not?

A. It was not consistent with the conditions as they must have been unequivocally understood by the competitors accepting competition.

Q. 7. Was it in accordance with the conditions that a public exhibition of the plans should be held before the sealed envelope containing the award of the assessors and the envelopes containing the names of the competitors had been opened, seeing that these conditions stated that the exhibition, if any, should take place "after adjudication?"

A. The exhibition should not have taken place until after the envelopes containing the names of the competitors had been opened and the final decision of the Board of Control known.

Q. 8. Was it right or just under the conditions, and in view of the general rules which govern competitions of the kind, that the author of one of the three selected designs should be afforded an opportunity of substantially amending his design, whilst no such opportunity was extended to the other authors of designs stated by the assessors to be of "equal merit?"

A. No opportunity to amend his design should have been afforded to any one of the competitors until after the final decision of the Board of Control, unless similar opportunities were afforded to the authors of the other premiated designs.

"Antiquity after a time has the grace of novelty."—HAZLITT.

THE FIRE OF LONDON.

THE following account of this occurrence was found among the papers of Dr. Worthington, who was master of Trinity College, Cambridge, during Cromwell's protectorate. On September 2, 1666, he wrote to one of his friends (MS. Harl. 7045):—"I preached at Benet Fynk in the forenoon on Matt. v. 3. There was no sermon in the afternoon. A great confusion in the City by reason of a dreadful fire, which began in Pudding Lane. On Monday night, or Tuesday morning, it burned down our church and went through the parish, not leaving an house."

A few days after Dr. Worthington addressed the following letter to another friend, Dr. Evans:—

September 11, 1666.

My time is but short in these parts; I am now preparing for my removal into my northern solitude. God hath discharged me from any further employment in London, where I have

preached for some time, and (through his goodness) not without some fruit. Some of all persuasions, and that had wandered through all forms, placing the kingdom of God in opinions and exterior essentials, have been awakened to other thoughts and received settlement in better things, as I have received it from them and others. A serious auditory of many persons engaged me to hold the place longer than I should. For as for the incomes from the place, they were not so much as they should have been; and the whole was no superfluity, if it had been received. Yet do I not the less thank you for the place; I know you could have been glad it had been more. By reason of this dreadful fire, the church, the house, and the whole parish is consumed, and the people scattered (every one shifting for himself), so that I shall lose, in what was due, for the two years I preached there, and would have been due at Michaelmas, at least 90% (as I have computed the particulars), which though it make no great report and sound in the ears of the great and rich to abundance, yet it is as much to me as their thousands to some; nor could I have held out so long had I not been helped by a little I have—which is little enough for a family of eight persons. By reason of the fire's coming on so suddenly, and the great confusion of such a time, I lost several goods in the house. Some I forgot in this distraction, and some I had not time to remove, having none to help me but one maid. My wife was not well, and others in the family were to be tended, not being well, so that I had not the hands and help which else I might have had. Some trunks that I removed had like to be lost in the streets; they were thrown down and trampled in the dirt, and were given for lost, but at last very hardly recovered. The best of my trunks was given to the flames. It stood in a corner and out of sight, and some things of a far better value than we carried away were also lost and consumed. Next to the danger of the fire was the confusion in the streets, in ours especially (being a great thoroughfare), so that to me it was a wonder that many were not crowded to death or trampled and crushed in pieces by the carts and horses. Several lost their goods after they were carried out, losing the porters in the crowd. Sometimes I have seen places in the streets all strewn with feathers, which might be the destruction of beds. One burden which I sent I thought had been lost, the porter not appearing of a long time; and one porter that carried away a chest for me, finding it heavy, left it in the streets in a corner, and we saw him no more, but happily got our chest again. Some porters would go away after the first carriage and then we were to seek new ones. It is impossible for any man that was not an eye-witness to express, or for the absent to imagine, the dreadfulness of this conflagration, the confusion in the streets and at the gates (where people were forced to stay an incredible time to get through with their burden), the consternation and amazement of men's minds. Every one is now ready to say that they might have preserved more of their goods, or secured more houses from the fire; but at that time their reason and dexterity was half taken from them that they rather gazed upon the flames, and went about their business in a hurry, than acted rationally. I stayed as long as I could in the house, and, night coming on, I was fain to go to Hackney. Many are quite undone, others almost. Bee hath lost 6,000 lib., some say 10,000 lib. Other booksellers 4,000 lib., or 2,000 lib. Dr. Bates hath lost 2,000 lib. in books. Dr. Tackerey's library, in Scriveners' Hall, was burned. Sion College destroyed, and many of the books. Gresham College was preserved by the activity and bounty of some in it, and the fire was stopped in Broad Street, the Dutch minister's house and Dr. Bolton's house being burnt, but the Dutch church not hurt, and but a little of Dr. Bolton's on the south end. Sir Nath. Bernardiston, in St. Martin's Owtwich parish, by the bounty of his purse, engaged men to work hard, and stopped the fire there, and so it was stopped at Aldersgate and elsewhere. Of ninety-seven parish churches there are but twelve remaining. Of the rest, only the walls or some pieces, and the steeples; if it were not for these, it could not be known where the streets were. Blackfriars Church, that had no steeple, is so buried in the heapes that the old clerk, who hath been there forty years, could not discern where the church stood. The Exchange was gone in less than an hour. I walked over part of the ruined city that I might be the more sensibly affected, as none can be but by seeing it. And I think such a mortifying sight is worth a journey, that men may be the more convinced of the uncertainty and vanity of things below. I was afraid of some severe judgment when I considered that many were not bettered by the former judgment, the Plague of London. God grant that this Fiery Tryal may purge and purify us from our filth and soil. I was with others beginning to put the business of procuring Petitus his MSS. in a probable way, but now there is no moving for the present. I wish I could have done more for the public good of learning and encouragement of worthy, ingenious persons than I have, and am glad that I have done somewhat when I had opportunities. It was a pleasure to me when I was in the university or in London. But I am now taken off from a more

public active life into a more private retired way. On October 2, I intend (God willing) to leave these parts, and after I have ventured my health about Mr. Mede's book and my life in preaching all the plague time, I am where I was when I came hither. I did not expect much, nor am I therefore much disappointed. I have for a long time desired the private retired life for some space, and it may be, God sees it best for one. I wish that those that are well provided and accommodated may improve their opportunities for the promoting and encouraging of what is for the public good, which is their concernment as well as mine. If there be anything that I owe you upon any payment due from Benet Fynk to your society, I desire to know it that I may take order about it, for I would owe nothing to any but love.

THE LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

A MEETING of this Society was held at Chetham College, Manchester, on Monday night. Mr. J. Holme Nicholson presided. The principal paper of the evening was by Lieutenant-Colonel Fishwick, who gave an interesting account of Tim Bobbin's paper war with John Whittaker, the Manchester historian. Colonel Fishwick showed that while Collier duly acknowledged the value of some of Whittaker's work, he felt himself justified in ridiculing not a few of the writer's theories. The plain common sense of the critic was strong enough to demolish a considerable number of the learned doctor's castles in the air. Colonel Fishwick thought Collier was fully justified in the somewhat severe criticisms he delivered on the subject, and said it was to the credit of the humble schoolmaster that he so readily discovered the weak places in a work which at the time it was published was no doubt considered a masterpiece of erudition. Collier was master of the situation on many points. Modern research had proved him to be right and Whittaker to be wrong. In the course of his paper Colonel Fishwick referred to the supposed Roman road over Blackstone Edge, and said it was a significant thing that Collier, who lived within a short distance of the locality, should have said that there never was the least vestige of a Roman road there, and that there was no probability of there having been such a road. A question thus arose as to whether the road that was now supposed to be a Roman road was then completely covered over, for if the road was exposed Collier must have seen it, and he was far too honest a controversialist to have ignored its existence. Or was it possible that the road was then used for some purpose which to Collier's mind made it clear that it was not a Roman road?

THE SOHO FOUNDRY.

THE fame and fortunes of Soho, says the *Birmingham Daily Post*, have been the wonder of the world for more than a hundred years, and the names of Boulton, Watt and Murdock have become honoured memories through the engineering world. The *edax rerum* has triumphed at last, and in a few months longer the sites will be lost for ever. The Soho House, where Matthew Boulton lived, with lavish courtesies to all the famous people of the last century, still remains as a School of Art. The old Soho Works, so well known, and so famous as "the toyshop of Europe," and the development of the vast houses of steam-power, the rare and graceful products of skill and fashion for all parts of the world, the huge and busy workshops which were the "sights of Soho," and the admiration of all who saw them, secured for Soho unrivalled fame. Half a century ago the times and fashions had changed, and in 1850 the works were slowly dismantled, and scarcely a relic now remains. The "Old Pool" was drained, the picturesque trees which surrounded the works were felled, the vast manufactory, which had been growing for nearly a hundred years, with the fine and handsome Soho House, was rapidly surrounded by the modern builder, and the eight various branches of industry—"Buttons in general, buckles and latches, silver and plated goods, medals and rolled metals, mint for Government coin, mercantile trade, ironfoundry and steam engines and letter-copying machines"—the pleasant views and the keepers' cottages were doomed and lost for ever, leaving scarcely "a wrack behind." One portion of the works which had been added by Boulton in 1775 and completed in 1776 was, however, an important establishment, although at a considerable distance from Soho. It was provided partly as a relief from the crowded workshops in the original building on Soho Hill and over the Great Pool, and partly for the manufacture and finishing of heavy work and machinery, for boring, drilling, lathes, cylinders, and especially for foundry-work, which was developed and increased partly by Matthew Boulton, and in later years by the genius and industry and skill of William Murdock in 1809, when solid cylinders were

bored, special slide-valves invented, oscillating engines perfected, models of locomotives made, gas-lighting purified and perfected, and the area and powers of the foundry were marvellously improved. In 1850, when Soho was dismantled and broken up and sold, the coinage was removed to the foundry and continued and extended with marvellous skill and success, especially in the bronze coinage, which has never needed alteration or correction, and which produced enormous quantities of the familiar coins. Matthew Boulton, himself not merely an able business man, but an able mechanician, designed all his presses and dies, and his work has remained unchanged and unchallenged down to our own times.

The Soho Foundry of 1776 was the scene of a very remarkable "Rearing Feast" on December 30, when it was formally dedicated by the "princely Boulton," and the workmen were regaled in good old English style and in a curiously classic form. The address of Mr. Boulton, sen., upon entering the foundry was in the following terms:—"I could not deny myself the satisfaction of wishing you a happy and joyous day, and expressing my regard for all good, honest and faithful workmen, whom I have always considered as classed with my best friends. I come now as the father of Soho to consecrate this place as one of its branches; I come also to give it a name and my benediction. I will therefore proceed to purify the walls of it by the sprinkling of wine, and in the name of Vulcan and all the gods and goddesses of fire and water I pronounce the name of it Soho Foundry. May that name endure for ever and ever, and let all the people say amen, amen. This temple now having a name, I will propose that every man shall fill his pitcher and drink success to Soho Foundry." Mr. Boulton then proceeded to give the establishment his benediction:—"May this establishment be ever prosperous, may no misfortune ever happen to it, may it give birth to many useful arts and inventions, may it prove beneficial to mankind and yield comfort and happiness to all who may be employed in it. As the smith cannot do without his striker, so neither can the master do without his workman. Let each perform his part well and do their duty in that state to which it has pleased God to call them, and this they will find to be the true rational ground of equality. One serious word more and then I have done. I cannot let pass this day of festivity without observing that these large piles of building have been erected in a short time in the most inclement season of this year, without the loss of one life or any material accident. Therefore let us offer up our grateful thanks to the Divine Protector of all things, without whose permission not a sparrow falleth to the ground. Let us chant hallelujahs in our hearts for these blessings, and with our voices, like loyal subjects, say, 'God save great George our King.'" Alas for all human hopes. The Soho Foundry, after its long and honourable career and services, will soon be known no more. Its famous record and its very site, perhaps, will be forgotten. A series of misfortunes has led to difficulties; the gates have been closed, and the great engines and tools, which have won so many prizes, will soon be scattered.

Fortunately, however, there are some relics of great interest, and even of historic value. The machinery may be removed and disposed of, but the records remain. These include nearly all the books, drawings and plans which have been preserved for nearly a century and a half; the books of letters, wages and drawings have, happily, been preserved, and form an unrivalled mass of facts relating to the founding, development and growth of one of the largest and most interesting departments of a great and famous industrial enterprise for more than a hundred years. Excepting the Plantin Museum at Antwerp, where a printing office of the sixteenth century has been preserved intact, with its presses and types, and where even stray "proofs" have been kept, there is probably no other record so extensive as the relics of the Soho Foundry to be found anywhere. The drawings and papers include the growth and progress of all kinds of work, the history of the steam-engine, the development of gas-lighting, the growth of nearly all the great industries of Soho. In many cases the details of wages, the costs of materials, estimates, &c., are preserved. The letters, not only of Boulton and Watt to each other, but those of Murdock, Creighton, Southern and Buckle, the famous "Soho" men, almost innumerable letters from the most eminent scientific men of the past eighty to one hundred years, number, all told, about 15,000. All of these are full of interest, and have great historic value. Many of the minor inventions, as models, of Watt and Murdock, have been carefully preserved and endorsed; and rare engravings, the original etters patent, and daily records and incidents of scientific value have happily been saved from loss. Most of these have been unseen and unknown, and might readily have been lost, but some years ago the manager (Mr. W. Henry Darlington) collected and arranged the mass of papers, drawings and relics, and placed them in a special room, where they were overhauled and preserved—a record-room which is unrivalled, and which will be found to be not merely curious, but a unique summary of industrial history and of national progress. Mr. George Tangye has generously and thoughtfully, with considerable

difficulty, succeeded in securing this unique collection intact. It was feared that some American millionaire might buy the whole collection, or that it might be removed elsewhere, but it is now placed safely in the Cornwall Works, and will be carefully arranged and described; and, in addition, Mr. Tangye has had a series of photographs taken of the most important parts of the once-famous works.

GENERAL.

Mr. William D. Caroe, who is a younger son of the Danish Consul of Liverpool, has been appointed architect to the Ecclesiastical Commissioners, in succession to the late Mr. Ewan Christian.

Sir George Scharf, K.C.B., has been appointed a trustee of the National Portrait Gallery.

The Council of the Royal Society of Painter-Etchers have elected the following Associates Fellows of the Society:—D. Y. Cameron, J. Finnie, O. Hall, J. Knight, R.I., A. Legros.

The Visitors to the New South Wales National Gallery during 1894 numbered 273,757, or an average of 750 daily.

Mr. W. Bindloss, who was mayor of Kendal, has bequeathed 3,000*l.* to provide a chime of bells for the new Kendal Town Hall, 10,000*l.* for the purchase and conversion of his hospital at Milnthorpe into a block of almshouses, 30,000*l.* for the extension and improvement of the Kendal water-supply, with his family residence, surrounding land, out-buildings and farm adjoining, for the maintenance of the Kendal Town Hall.

Mr. James Price, who was formerly chief engineer to the Midland Great Western Railway Company, died a few days ago at his residence, near Dublin, in his sixty-fourth year.

Mr. Lionel Cust has been appointed director of the National Portrait Gallery in succession to Sir G. Scharf.

Sir Frederic Leighton, P.R.A., will not preside at the Royal Academy banquet next month. According to the *New Budget*, the President has been advised by Sir W. Broadbent that he must at once leave England on a prolonged holiday, and he starts for Gibraltar, his first resting-place. Sir John Millais, R.A., will fill the vacant chair at the banquet.

Mr. J. Vicars, of Sydney, has been appointed city surveyor of Adelaide. There were thirty candidates.

The Improvements Committee of the London County Council have recommended the purchase of the strip of land at the eastern corner of Wellington Street, at its junction with the southern side of the Strand, with a view to increasing the width of the latter thoroughfare at this point from 68 to 80 feet, and thereby affording relief to the traffic. The Duchy of Lancaster have agreed to accept 10,000*l.*, and the National Telephone Company 6,000*l.*, for their interests in the property.

The Roman Villa recently unearthed at the pretty little village of Darenth, in Kent, is attracting a large number of visitors, many of whom are doubtless impelled by pure curiosity alone, but the majority certainly outwardly bear the impression of those learned in antiquarian lore. The nearest station is Farningham Road, on the London, Chatham and Dover Railway, about twenty minutes' distance from the discovered ruins.

The Commission for three figure-windows for Sandon Road Wesleyan church, Birmingham, has been received by Messrs. Swaine, Bourne & Son, Birmingham and London, artists in stained-glass, and will be fixed next month. The same firm executed the large chancel window so highly eulogised by both the press and public last year.

The Annual Meeting of the Leeds and Yorkshire Architectural Society took place on Monday, when the following were elected office-bearers for the session 1895-96:—President, E. J. Dodgshun; vice-presidents, W. Watson (Wakefield), W. Carby Hall; hon. treasurer, William H. Thorp; hon. librarian, W. H. Bevers; hon. secretary, Francis W. Bedford; members of council, W. S. Braithwaite, H. B. Buckley, G. F. Danby, W. A. Hobson, James Ledingham (Bradford), W. C. Williams (Halifax); auditors, H. S. Chorley and L. S. Dodgshun.

Colonel Mitford has given a new altar to Filey Church (of which living he is the patron), in memory of his golden wedding. It is of carved oak, over 8 feet long, the panels of which have been painted by Miss Wheelhouse.

New Hunstanton, Norfolk.—A limited competition for the District Council Buildings for this place has just been decided, the plans of Messrs. George J. & F. W. Skipper, architects, of Norwich, being unanimously selected. Four other architects (all of London) were invited to submit plans. The amount to be expended is 2,000*l.*

The Architect.

THE WEEK.

A GREAT painter who was never sufficiently appreciated by his countrymen was PAUL CHENAVARD, who died last week in Lyons. He was born in 1808, and was therefore one of the few survivors who could recall the contests between the champions of Romanticism and Classicism. As a pupil of INGRES he belonged to the latter side, and, like his master, CHENAVARD attached more importance to careful drawing than is now thought to be advantageous. In 1827 he went to Italy. It was the time when the Germans were asserting their power in Rome, to the surprise of the rest of the world. CHENAVARD was brought under their influence, and he aspired to make of his art something more than a gratification for the eyes. Like CORNELIUS, KAULBACH and OVERBECK, he wished to have painting a rival of literature. Accordingly, when he returned to Paris in 1830 he commenced the preparation for a great series which would exemplify the *History of Humanity*. He devoted himself to his task with a self-sacrifice that corresponded with JAMES BARRY'S when he decorated the room of the Society of Arts. LOUIS PHILIPPE'S Government did not care much about humanity in general, and CHENAVARD received no encouragement. When the Revolution of 1848 succeeded, the painter believed his opportunity had arrived. He obtained a decree by which the Panthéon was assigned to him in order that he might represent the *History of Humanity* around the walls. He was allowed four assistants, artists as enthusiastic as himself; but the pay was more than modest, viz. 10 francs a day. The pictures were to be about 20 feet high. The fall of the Republic was fatal to the scheme. CHENAVARD took home his cartoons, and they remained with him until 1870, when he was persuaded to present them to the Musée of Amiens, which was his native city. They were the great work of his life, and he never cared to undertake (nor, indeed, was he offered such a commission) another enterprise of equal importance.

THE series begins with *The Deluge*, and although wanting in colour, the cartoon indicates the immensity of the desolation. The next is *The Judgment of the Kings of Egypt after their Death*. The *Death of Zoroaster*, an incident in the Eastern contests between the military and sacerdotal castes, shows talent for representing vigorous action. The architectural detail of the temple where the murder takes place may not correspond with modern discoveries, but it has a grandiose effect, and suggests the study which CHENAVARD must have given to building, which at the time was always conventionally treated. His *Trojan War* is one of the noblest of Homeric illustrations. In *The Death of Socrates* the artist avoided competition with DAVID by representing the sage as lying unmoved after drinking the hemlock. The *Age of Augustus* enabled CHENAVARD to represent a scene that was not tragic. He has grouped the celebrities with skill, and in VIRGIL and HORACE, who appear in a prominent place, he has expressed character. In representing a part of the life of CHRIST, CHENAVARD proved his competence to treat the most sacred themes. In the *Catacombs* he has hazarded much by dividing the picture in two, the upper part showing the barbaric treatment of the Christians, while below is seen a group at a love feast awaiting martyrdom. CHENAVARD provokes comparison with RAPHAEL in his *Interview between Pope Leo and Attila*, but he is far more true to history. The *Decameron* is a group in which DANTE and BEATRICE, PETRARCH and LAURA, BOCCACCIO and others are seen in an enchanted garden. In Paris a painter would be obliged to subdue the importance of the event *Luther tearing the Pope's Bull*, and CHENAVARD consequently introduces only a few spectators as witnessing the transaction. More flattering to his countrymen is the *Age of Louis XIV.*, in which the celebrities who gave renown to that time are seen at Versailles. It is the climax of the series. On that account probably neither NAPOLEON III. nor his successors in ruling France were eager to allow CHENAVARD to represent his *History of Humanity* on a more enduring material than sheets of paper.

IN one of the papers read at the last meeting of the London and Middlesex Archæological Society, the Roman remains discovered during the excavations on the site of 62 Threadneedle Street were described by Mr. H. JONES. Sanitarians will be glad to learn that the most interesting object was a bath formed of some kind of cement. Apparently it was intended for family use, since it was too large to be accommodated in the Guildhall Museum or the British Museum. In either institution it would be unique. The bath suffered during the excavations, for labourers could not be expected to imagine that the rough cement they encountered was more than a part of a foundation.

THE new hospital for sick children at Rillbank was described by the architect, Mr. G. WASHINGTON BROWNE, to the members of the Edinburgh Architectural Association on the occasion of a visit on Saturday. He pointed out that the wards ran from east to west in order that they might have as much light and sun as possible. There were four large wards, each with twenty-four beds; one spare ward and small wards for observation and isolation, providing in all for about 120 patients. The nursing staff was larger in a children's hospital than in one for adults, and there it would consist of five sisters, twenty-one day nurses and eight night nurses. With resident doctors, matrons, &c., there would be a medical and nursing staff of forty. A new feature in such buildings was introduced, viz. a play alcove for convalescent children. The kitchen was placed on the top of the house, and for the twelve domestics who would be required there was a servants' hall. The cooking had to be done principally by gas. All through the building the ventilation had to be by natural and not mechanical means, and the heating, in four sections, by low-pressure hot water in coils and pipes. The artificial light was to be electric, and for that they were laying down their own plant, with two boilers, engines and dynamos. Either engine might be driven by either boiler, so that they were safeguarded from a breakdown of the light. About half-past ten o'clock at night the light would come from cumulators, and hence there would be no machinery going at night. In any case, the machinery was away from the building. There would be 404 lamps of 16 and 8 candle-power. They were also laying down their own steam laundry. In showing, on the various floors, how the plans had been realised, Mr. BROWNE drew attention to the absence of ornamental plaster-work, and remarked that the hospital was constructed in a purely utilitarian spirit. It is expected that the premises will be ready for occupation in August.

CARE will have to be taken that the examination of buildings by local authorities does not become a farce. From time to time we hear of proceedings which are not only oppressive but are based on groundless charges. A case of the kind was heard during the week at King's Heath, Birmingham. Messrs. J. H. HALL & Co., builders, of King's Norton, were summoned at the instance of the King's Norton Rural District Council for infringing the by-laws by constructing houses with bricks unfit for use. The surveyor said he inspected the buildings on April 2, and found that the bricks were not good. On the 3rd he took some to the Selly Oak Workhouse, where the District Council were holding a meeting, and the bricks, on being examined, were condemned. For the defence it was said that the case was of considerable importance to builders. The firm who had supplied the bricks were engaged in extensive building operations at Cotteridge, and for the bricks used to be condemned in that wholesale manner was a very serious matter. The manager of the firm who supplied the bricks, Mr. OWEN, architect, and several bricklayers gave evidence to show that the bricks used in the buildings were sound and good. The foreman of the bricklayers said that the samples had been taken from a heap of rejected bricks. The Bench decided to dismiss the case. We suppose all builders are liable to suffer persecution of the kind that was condemned at King's Norton, but should less rashness not inspire the action of the authorities it must be expected that by-laws will be brought into general disrepute, and magistrates will hesitate before they punish manifest breaches of the law.

MEDIÆVAL CONSTRUCTION.*

AS American poets and other writers have regretted that the Pilgrim Fathers did not bring some English ghosts with them to confer a little romance on the new settlements, we suppose many American architects have often desired the possession of a few Gothic cathedrals and churches. An art like architecture, which depends so much on precedent, cannot expect to thrive where no precedents are visible. In England or France, if there is a doubt about a question of Mediæval detail, it is not difficult to solve it in the most convincing way by examining genuine examples. An American architect would be compelled to depend on the authority of some witness. A case of the kind is exemplified by the volume before us. Mr. Huss explains its origin when he says:—"While preparing drawings for a large cathedral church in New York city the article 'Construction' of the 'Dictionnaire Raisonné' was freely used, and then the idea was conceived of translating it into English." It would be an advantage if many, if not all, of VIOLLET-LE-DUC's articles could appear in an English form. The volumes of his "Dictionnaire" are supposed to be indispensable in every architect's library. But the use made of them by the majority of the possessors depends mainly on the woodcuts, which may be said to speak a language which is intelligible to architects of every land. The text is rarely studied. And yet in such articles as "Construction" we have not only an immense amount of information or facts derived from the study of buildings, but what is more rare in works of an encyclopædical class, much shrewd thought. In gathering up the conclusions from other articles in those summaries the author is not afraid to express his own opinions, however startling or inapposite they may appear. Take one case. It is natural to expect that an enthusiast for Gothic art and an architect who had charge of the conservation of ecclesiastical buildings would hope to see French churches lasting as long as the great globe itself. But VIOLLET-LE-DUC, who might struggle against the effects of time, was assured there was a more potent enemy which no architect or commission for the preservation of historic monuments could resist. In one place we find him saying:—"The cathedral of Noyon has stood for seven centuries, and provided it can be repaired suitably, it can last five hundred years longer; now twelve hundred years appears to us a reasonable duration for a building, *since the great social revolutions to which humanity is subject will destroy them anyhow*, even if they are able to continue for a longer period." In politics he was no less disposed to be wayward. VIOLLET-LE-DUC was one of the hangers-on at the last Imperial Court in France. Yet we find him treating the labour problem in a manner that must have startled the Tuileries, if any of the guests could be supposed to be capable of reading the "Dictionnaire" and reporting the contents. He says, for example:—"Workmanship has declined among us at the periods when men have tried to submit individual labour to diverse Classic rules established by an absolute power. Now when workmanship declines, social crises are never far off in France." And then he goes on to explain how the building trades were a dangerous force. The unlimited Haussmannising in Paris and some of the provincial cities may have been intended to subdue the malcontents.

VIOLLET-LE-DUC could occasionally surprise people, and who knows if he were now alive whether he would recommend the translation of his "Construction" for the use of the American architects who were engaged in the St. John's Cathedral competition? He would uphold what he said about Gothic alone furnishing the "ingenious and practical means of solving the numerous difficulties which surround the constructor living in the midst of a society whose needs are complicated to excess." But he might express a doubt whether nineteenth-century cathedrals, assuming them to be necessary, must have Pointed arches and resemble the buildings which were planned for a different sort of ritual. He would be likely to ask why Americans who had been so

well able to meet novel requirements in engineering construction, and who could span wide rivers and valleys by trusses that were more ingenious and more economical than any devised in Europe, should not be permitted to develop Mediæval construction in the way that seemed to be most rational? What he said about the Carolingian builders is not inapplicable (*mutatis mutandis*) to a time when another transformation has become desirable, and nowhere would there be a more fitting place for a trial than in the youngest of the great capitals of the world, New York:—

The stern necessities by which these first constructors found themselves confronted compelled them to fall back on their own resources in preference to the studies of ancient monuments, which they understood but very imperfectly, and which in the greater part of the Gallic provinces existed only in a state of ruin. Ever ready to imitate foreign works, they submitted these to their own imperfect processes, and in thus transforming them they made them contribute towards a unique art in which reason prevailed over tradition. That was a hard school; resting with uncertainty upon the past, finding itself confronted by the needs of a civilisation when everything had to be created, possessing but the elements of the exact sciences, it had no guide other than experiments; but this method, if not the quickest, had, at least, the advantage of making practical observers, who were careful to collect all the improvements which could help them.

In an age when the methods of science are brought nearer to perfection, it might be supposed that something more is feasible than was accomplished by the Carolingians and their successors during the succeeding centuries. As long, of course, as certain forms are held to be sacred, it is dangerous to depart from them. With VIOLLET-LE-DUC, however, form was considered to be of less importance than constructive methods, and it should always become subservient to necessity. When speaking of the courageous attempts of the old builders, and their defiance of anything like academic conservatism, he says:—"Construction was not for them, that science which consists in saying, 'Here are the rules, here are the examples, follow them out, do not go beyond them.' On the contrary, science for them said:—"These are the general principles; they are broad, they indicate nothing but methods. In their application, extend them as much as the material and your experience allows you; we ask nothing of you, except to remain faithful to those general principles; moreover, everything is possible to him who knows how to apply them." It would be pardonable if the Mediæval monks were satisfied with their early efforts to solve the problems of construction. Nor could it be expected that they would be zealous in meeting all the claims of secular clients. It was the opinion of VIOLLET-LE-DUC that before the end of the twelfth century the majority of architects were laymen. One of his reasons is the absence of praise of the builders and buildings in the monastic chronicles. The churches of the Romanesque period form the subjects of many laudatory notices, but the annalists become abruptly silent at the end of the twelfth century, when architecture passed from the cloisters into the hands of the laity; perchance there is a word about the edifice—a phrase dry and laconic—but as to the masters of the work nothing. In the voluminous records of the church of Notre-Dame at Paris, which contains documents dating back to the twelfth century, not a single word is said about the construction of the present cathedral. But in the earlier days when experiment was more difficult, without the religious bodies architecture might have remained for a much longer period in its trance. It was the monks who awakened the sleeping art and fostered architecture until it had regained some of its earlier strength. Many people will suppose that their care was selfish, a grasping after power, a superseding of the more competent laymen; but, as VIOLLET-LE-DUC explains, individual laymen could not prevail when architecture needed most care:—

The religious orders were the first who could by themselves undertake important building. First, because they could assemble at one place a number of workmen sufficiently united by a single thought, subject to discipline, freed from military service, possessors of the land on which they lived. Secondly, because they amassed property which grew rapidly under a regular administration; because they joined in amicable intercourse with neighbouring establishments, because they ploughed up and rendered wholesome uncultivated lands, laid out roads, acquired by gift or purchase the richest quarries, the best woods, built workshops, offered to the peasants guarantees relatively certain, and peopled their lands thus rapidly to the detriment of those of the lay nobility. Thirdly, because they were able, thanks to their privileges and the comparative stability of their institutions, to form with their monasteries schools of artisans, subject to a regular ap-

* *Rational Building.* A Translation of the Article "Construction" in the *Dictionnaire Raisonné de l'Architecture Française* of M. Eugène-Emmanuel Viollet-le-Duc, by George Martin Huss, Architect. New York and London: Macmillan & Co.

prenticeship, clothed, fed, maintained, working under the same direction, preserving traditions and recording improvements. Fourthly, because they alone, at that time, extended their influence to a distance, in founding establishments subject to the mother abbey; because thus they continued to profit by all the partial efforts that were made in countries very diverse in climate, manners and customs. It is to the activity of the religious orders that the art of construction owes its rise from barbarism to the eleventh century. The Order of Cluny as the most important, the most powerful and most enlightened, was the first which had a school of architects, whose new principles were to produce in the twelfth century monuments freed from the last Roman traditions.

It might also have been added that the ecclesiastics had preserved the tradition of the art as it was recorded in copies of VITRUVIUS. There is a remarkable instance in the correspondence of EGINHARD, who was the friend and it may have been the son-in-law of CHARLEMAGNE. Afterwards he became a priest. In a letter to his son VUSSIN he says that he sends with it lists of obscure words and phrases which he collected from VITRUVIUS in order that VUSSIN may help him with an explanation of them. The letter reveals that a busy man like EGINHARD, who was engaged in the affairs of the empire as well as in building churches and collecting relics, could occupy himself with the ancient treatise on architecture, and would not skip difficulties without an effort to understand their meaning. It also shows that owing to the progress of learning the succeeding generation possessed an increased power of interpretation. That was not attained by the comparison of texts alone, for EGINHARD tells his son of the aid he may obtain towards a solution of the difficulties by an examination of a certain coffer with columns of ivory, which was made in imitation of an antique monument. VIOLETTE-LE-DUC says that CHARLEMAGNE could not obtain architects from Rome, but from EGINHARD's letter it is evident that models of Classic buildings were available for builders. We also know from the Emperor's will that he possessed a silver table which he prized, for on it a view of Rome was delineated.

Models and views could be only incentives to exertion. Constructive difficulties must be overcome by the patient toil of the builders. Neither models nor views were likely to be correct, but it is not unreasonable to suppose they suggested the prevalence of vaulting in the Roman buildings, and the conclusion would then be drawn that every important building and especially churches must be vaulted. The basilican churches in Rome, it is true, were covered in a different way, but they could only be taken as mere interim structures. The region of Europe in which the attempts were made to revive dome construction was very wide. As E. A. FREEMAN says:—"The ducal chapel of Venice repeats the patriarchal church of Constantinople, as it is itself repeated in the far-distant abbey of Périgueux." The number of failures that occurred may have been incredible, for we cannot suppose that the Romanesque builders of the eleventh century were moved by any sudden or novel inspiration. Development generally moves like a stream, at one time sluggishly, at another time quickly, but whatever the rate the motion was continuous. There was a necessity for improvement in roofing. To the Christians a vaulted roof may have been typical of heaven, especially when they heard the words "sursum corda." It was certainly more dignified than a flat surface. What was most needed was, however, the nearest approach to uninterrupted space. Waggon vaults were inadequate for roofing, for with them there must be either a very limited width for churches or longitudinal division walls, which would be obstacles to seeing and hearing. The aim of the clergy was to unite the people as one body, which was not possible so long as they were separated by walls or large piers. The whole problem was the covering of space while employing only a few points of support. The Roman vault was adapted only for spaces that were square, but, says VIOLETTE-LE-DUC, "during the eleventh century the builders had constructed vaults which partook of both the dome and the ground vault, in that these vaults, instead of being formed by the intersection of two cylinders at right angles, are produced by four semicircular arches joining the two piers, and two diagonal arches which are themselves semicircular, and hence present a longer radius than those of the first four." When after long years of groping that mode of covering a space was found practicable, which differed both from the ancient

Roman and the Périgueux methods, a new era in construction had opened. The roof assumed due importance, for its arrangement became one of the first thoughts of the architect when planning. That may now seem strange, for there are many facilities for constructing roofs of enormous span. But the Mediæval builders were compelled to depend on their masonry, for they could not form a framework of iron which in secret would oppose all that might lead to rupture.

When the start was made progress became comparatively easy. The new vaulting made Romanesque forms appear out of keeping, and as a consequence what we call Gothic was perfected. The architects were ambitious to amaze the world and endeavoured to make it appear more and more puzzling how their buildings were sustained. The flying buttress was one of their expedients. VIOLETTE-LE-DUC maintains that the adoption by the builders of the flying buttress, which led to so many collapses, at the end of the twelfth century was a despairing act, "since they were seeking to avoid it as far as possible, and since they distrusted this means whose advantages and power they were not yet able to appreciate, and that they regarded it only as an auxiliary, a last resort, often an afterthought, and when they had learned that they could not do without it." He has to admit that in such a case as the choir of Beauvais Cathedral there is inherent weakness, for "that outer scaffolding of stone which forms the whole strength of the building is subjected to the action of the atmosphere; it seems as if the builder, instead of trying to protect the vital parts of his structure, had taken pleasure in exposing them to all the chances of destruction." But VIOLETTE-LE-DUC cannot refrain from expressing his admiration of the experiment. It is on a par with the charge which was magnificent but not war, with the brilliant surgical operations which only gave pain to the patients. If masons' bills need not be paid, if clients' interests could be ignored, a repetition of the fine feats at Beauvais would be entertaining, but under the modern system of debit and credit they can hardly be considered as building in the accepted sense of the word, for it does not signify expending money to insure a collapse.

In many other cases a collapse was avoided by the employment of safeguards that are analogous to the veiled girders and rolled joists of our time. How many admirers of the exquisite little Sainte-Chapelle in Paris are aware that every course from base to summit was secured by iron fastenings? All the parts of Notre-Dame in Paris which are later than the early part of the thirteenth century, or which were repaired, are also fastened by iron cramps set in lead. In such cases the Mediæval builders have obtained a reputation for daring under false pretences. They were not able to devise the parts of their buildings so that only direct compression would result, for, says VIOLETTE-LE-DUC, "the way in which these anchorages are arranged shows, moreover, that what they feared most was the bending or twisting of the piers and walls." English Mediæval buildings can also present similar examples of precaution against the contingencies that arise out of courageous construction, and the neglect of the maxim about the necessity of building stronger than strong enough.

When Gothic began it was a mason's style, and many a building must have been erected for which there were no drawings except what might be made with chalk on a board. In the days when it attained most *éclat* and unsafeness it had become a draughtsman's or a geometrician's style, which would still have interest if the work never advanced beyond the paper stage. The sketch-book of VILLARD DE HONNECOURT suggests that friends like himself and PIERRE DE CORBIE could amuse themselves in creating novelties of construction which no contractor would care to undertake to realise at a moderate cost, or unless he was free from liability for accidents. We may suppose that many other educated gentlemen in the time of St. Louis found pleasure in similar efforts.

The civil construction of Mediæval times represents different conditions, and another sort of treatment was permitted. The churches were governed by the necessities of the covering, but, as VIOLETTE-LE-DUC says, in other buildings "very rarely, unless it may be in a few towns of the south and centre, the ground-floors were vaulted; consequently there were no buttresses, no projections on the

exterior." Unfortunately, not many examples of Mediæval secular building have survived, and it is therefore safe to assert that they, to a large extent, corresponded with churches. VIOLLET-LE-DUC does not, however, fear to say that "civil and military construction preserved something of Roman art when the last traces of this art had long since been abandoned in religious architecture. There were, then, two quite distinct modes of building, dating from the end of the twelfth century, the religious and the civil, and this state of things lasted until toward the middle of the sixteenth century." During that period we have means enough to know that the builders must have been guided by principles, and regarded the nature of the materials they employed as well as the requirements of the occupants of the buildings.

In one part of his article VIOLLET-LE-DUC notices the desire for a new style, which is not yet abandoned. He does not ridicule it, but he says the style is not to be obtained by forbidding the study of that style of architecture which was most supple and free in the use of material means. Whether the "Dictionnaire" has brought us any nearer to the new style is not apparent, but there can be no doubt that it has revealed the value of Mediæval architecture with a clearness that is without precedent. The article on "Construction," which is one of the most important of all as an exposition of the subject, is masterly, and could only be produced by a man who was fortunate in having constant opportunities not only to study Mediæval architecture as it appeared to the world, but to see within the outer casing and to study the causes of stability and decay. The English translation by Mr. HUSS is therefore an addition to professional treatises which should be prized.

MATTIA PRETI: IL CAVALIERE CALABRESE.

AMONG the Naturalisti of the seventeenth century Mattia Preti was not as renowned as Spagnoletto or Caravaggio or Stanzioni through his paintings, but he gained a notoriety by his adventures, which perhaps was an equivalent. He might have modelled his conduct after the example set by Benvenuto Cellini, but fewer deaths can be charged to his account. In his wanderings, however, he surpassed Cellini.

Mattia Preti was born in 1613 at Taverna, a small town of Calabria. His genius for painting early developed itself, and at seventeen he went to Rome to join his brother, Gregorio, who at that time was director of the Academy of St. Luke, but whose name has passed into oblivion. From him he received instruction, and was guided in studying the works of the greatest Italian masters and the noblest statues of antiquity. He gained the patronage of Cardinal Rospiglione and of Pope Urban VIII., by whom he was made a knight of the court. While Preti was still undecided about the school he should follow, Guercino's *St. Petronilla* was brought to Rome. This at once decided him, and he immediately set out for Cento, where Guercino resided, and on his arrival was received with much kindness. For many years subsequently to this period Preti devoted himself almost exclusively to the study of design and composition, and did not take the brush in hand until his twenty-sixth year, when he painted a Magdalen in a manner that obtained praise from Guercino.

Preti was the Wandering Jew of painting. He travelled over half of Europe in order to make the acquaintance of the most distinguished painters and to visit the richest galleries, with the view of improving himself in the practice of his art. He journeyed to Parma in order to study the masterpieces of Correggio and to Venice to examine those of Titian, Tintoretto and Paul Veronese. Afterwards he met a Frenchman, who induced him to visit France, where he saw the paintings of Simon Vouet and of Le Brun. He was the most impressed with the pictures which Rubens had painted for the adornment of the Luxembourg. The sight of them determined him to repair to Flanders and make the acquaintance of that artist. On arriving at Antwerp his first care was to seek out the works of Rubens, which he daily visited. On one occasion while he was standing in the cathedral wrapt in admiration, he was accosted by a stranger, who requested his opinion of the painting at which he was gazing. Preti praised it and added that he had come to Antwerp solely for the purpose of making the acquaintance of Rubens and of studying his works. The stranger invited him to his house and they repaired together to a handsome mansion, richly furnished and adorned with noble pictures. But the more these were praised by Preti the more they were depreciated by the unknown. At length an explanation took place and the courteous stranger proved to be Rubens himself, who showed his Italian admirer much

kindness and presented him with a picture of *Herodias with the Head of St. John*. After leaving Antwerp, Mattia travelled through Germany. He was absent from Rome six years, and on his return he continued his studies. His name gradually began to grow famous. For the Pope he painted a *Christ crowned with Thorns* and *Penelope driving her Suitors from the Palace of Ulysses*, which were so highly thought of as to be at first ascribed to the pencil of Guercino. By birth Preti was descended from an ancient and honourable family, and he might consider himself as not unworthy of the honour when the Pope admitted him into the Order of Malta, the ceremony being held in the church of St. Anne in 1642.

The new knight could also claim to be as skilful with the sword as with the pencil. A fencing-master or bravo in the service of the ambassador of the Emperor challenged him to fence. The trial of skill was converted into a duel in presence of the Roman people, and the result was that Preti severely wounded his antagonist. This drew upon him the anger of the ambassador. The Pope, who knew that Preti was in danger of assassination, induced him to leave Rome at night and embark for Malta, at the same furnishing him with recommendations to the Grand Master. At Malta Preti painted the portrait of that dignitary, and a *Decollation of St. John*. His stay in the island was, however, very limited, for a knight of the Order having insulted him by sneering at his nobility, Preti struck him so rudely that he left him half dead. He was condemned to imprisonment for this offence, but saved himself by embarking in a felucca bound for Leghorn. At that seaport he met the Papal nuncio on his way to Spain, and joined his suite. He remained in Spain for some time, and painted several pictures, and, after the death of Urban VIII., returned to Rome along with his patron the nuncio.

There he found Lanfranco and Pietro da Cortona in possession of the popular favour and got little employment, except from the picture-dealers. This compelled him to leave the Eternal City and lead the life of a travelling artist, painting at Bologna, Venice and Florence. After the death of Lanfranco he returned to Rome, where his picture of *Jupiter and Niobe* obtained the prize of the Academy of St. Luke, of which he was soon after elected a member. The decoration of the church of San Andrea della Valle had been left unfinished by Domenichino and Lanfranco, and Preti received the commission to complete it. His pictures, however, contrasted unfavourably with those of the Bolognese artists who had preceded him, and this inferiority was contemptuously alluded to by one of his rivals. This was enough to inflame the hot blood of the Calabrian and a duel was the result, in which Preti dangerously wounded his opponent. To avoid the consequences he fled to Naples, where his adventurous career was nearly brought to a premature and disgraceful close. The plague was then raging and all strangers were prohibited from entering the city upon pain of death. Preti, ignorant of the circumstance, attempted to enter, was rudely opposed by the guards, and a soldier struck him on the cheek. To this insult he replied by a sword thrust, which laid his assailant dead at his feet. He succeeded in disarming a second antagonist, but was at length overpowered by numbers, thrown into prison and condemned to die. But the Viceroy, who knew his merits, interfered to save him, observing, "*Excellens in arte non debet mori*," and imposed upon him as his only punishment the task of painting upon the eight gates of the town the guardian saints of Naples. Preti afterwards became one of the favourite artists of the Neapolitans and obtained many commissions. For one of his patrons he painted a picture of the *Martyrdom of St. Bartholomew*, in which he introduced as one of the executioners a farmer whom he had often seen at the house of his employer. Unfortunately, the countryman recognised his likeness, and was with difficulty prevented from attempting to kill the painter who had taken such an unwarrantable liberty as to represent him engaged in slaying a saint. During his residence at Naples, Preti experienced considerable annoyance from the self-sufficiency and ignorance of some of his patrons. He had been employed by the monks of San Pietro à Mazella to work for their convent, and had established his studio on the pavement of their church, where he was occupied with a series of paintings from the life of St. Catherine of Alexandria, which were ultimately destined to be placed at a great elevation above the eye. When closely examined they appeared of course rough and unfinished, being painted in a free and bold style, calculated for the lofty position which they were intended to occupy. The prior, however, refused to accept what appeared to him to be little better than a set of rude sketches, and insisted upon Preti's refunding the money that had been paid for them. In vain the painter pointed out the reasons for the appearance of the pictures in their present position; the prior was obstinate and would not be convinced, and arbiters were therefore appointed, who pronounced the paintings excellent and ordered them to be placed in their destined position, which was no sooner done than the prior and his monks were compelled to confess their error and acknowledge the skill and forethought of the artist. So well

pleased, indeed, were they with the effect of Preti's pictures when properly placed, that they entreated him to continue his labours, which he was with difficulty persuaded to do. Greater men than Preti have had their works slighted and censured by ignorant pretenders with as little justice. Some time after his dispute with the monks of San Pietro, Preti sailed for Malta, where he was well received by the grand master, De Redin, and employed in executing paintings for the cathedral, which occupied him for thirteen years, and with which the Order were so well satisfied that they made him commander of Syracuse, and granted him a pension. He subsequently painted a number of pictures for France, Spain, Germany, Flanders, and also for his birthplace, Taverna, where he had endowed a chapel. He laboured constantly in his vocation, but latterly only for the sake of the poor, and on being reproached by a friend with his incessant labours, which were undermining his health, he replied, "What will become of the poor if I don't work?" He who had traversed Europe in pursuit of his art, had undergone dangers innumerable by sea and land, had escaped the attacks of secret enemies and open foes, was at length destined to meet his death from the results of a trifling scratch. His barber happened to cut his chin whilst shaving him, gangrene appeared, and, after suffering for two months, Preti died at Malta in 1699, at the advanced age of eighty-six. He was interred in the cathedral and his body was borne to the grave by the commanders of the Order. In spite of his fiery temper and his readiness to appeal to the sword, Preti appears to have been generally popular and beloved among his contemporaries. He had none of that paltry jealousy that was too common among artists, and especially prominent among the Neapolitan painters of the seventeenth century; and his conversation, enriched and enlivened by extensive reading and travel, is said to have possessed a peculiar charm. His chief merits as a painter consist in his design and composition, which are excellent; in a strong impasto and a vigorous contrast of light and shade, in which he resembles his master Guercino, though his pictures are blacker in the shadows. He is distinguished rather by the force than by the grace and delicacy of his pencil, and his sombre colouring is well suited to the general character of his subjects, which are commonly of a tragical and melancholy description, such as plagues, acts of penitence and martyrdoms. These had been introduced and rendered popular among the Neapolitan artists by their great founder Caravaggio and his successor Spagnoletto, who had treated them with marvellous breadth and power, but sometimes also with a ghastly minuteness of detail, as if they had gloated over the tortures of a martyr. The finest of Preti's works are still to be seen at Malta; but his oil-paintings in Italy and other parts of Europe are almost innumerable, as his long life, constant activity, rapid handling and habit of leaving some memorial of his genius wherever he went, enabled him to execute an incredible number of pictures.

THE LATE ERNEST TURNER.

IN the *Journal of the Sanitary Institute* for April Mr. A. Wynter Blyth offers the following tribute to the memory of Ernest Turner, architect, who died at Tunbridge Wells on March 16, 1895:—He was the third son of the late William Hall Turner, F.R.C.S., L.S.A., surgeon to the Asylum for the Deaf and Dumb, Southwark, and afterwards, of Red Hill, Surrey. Mr. Ernest Turner, born on July 24, 1844, was educated at King's College School, London, and afterwards articled to his cousin, the late Mr. Arthur Newman, architect, also of Southwark. On the expiration of his articles he was for some years assistant to Mr. Bulmer, architect and county surveyor, Maidstone.

On the death of Mr. Bulmer he took an office and commenced practice, first in Verulam Buildings, Gray's Inn, then in Bedford Row, W.C., and lastly in Regent Street. Mr. Turner early turned his attention to practical sanitation, and soon stood foremost among architects in his knowledge of the principles of hygienic construction and their application. One of his early successes was the acceptance, from a crowd of competitors, of his design for the Rotherhithe Sick Asylum. Afterwards he designed the Central London Throat Hospital and the hospital at Teheran, Persia. Besides these large undertakings he designed several steam laundries, such as those at Battersea, Kilburn and Penge, redrained a number of country houses, and also built several schools and private houses.

Mr. Turner's connection with the Sanitary Institute dates from almost its commencement. He attended the first annual meeting in 1876, before the incorporation of the Institute, and has always since that time been a member of its Council. He has filled various honorary posts, as chairman of committees, and a year ago was elected unanimously chairman of Council. In the ordinary course of things, had he lived, he would have been elected for a second year. During his connection with

the Institute no one has devoted himself with greater assiduity to its work; only urgent necessity ever caused his absence from a single meeting. Latterly the duties of chairman of Council have been particularly arduous, and it is to be feared that his strict and conscientious labours were during the past few months in excess of his strength. He presided all through a meeting of Council three days before his death.

Mr. Turner married in 1880 Miss Julia Davis, and the marriage was in every respect a most happy one.

Mr. Turner's extreme amiability of character endeared him to a large circle of friends; the more intimate the knowledge of the man the more there was found to admire. Learned in all matters relating to his own profession, and gifted with great common sense, his opinion was always valued.

To the cause of public health, as embodied in the labours of the Sanitary Institute, the loss is irreparable, and the small society of men on whose shoulders the labour of the work chiefly rests, acutely feel the death of their able and industrious coadjutor.

At a special meeting of Council held on March 20 the following resolution was unanimously passed and forwarded to Mrs. Turner:—"That the Council of the Sanitary Institute have received with profound sorrow intelligence of the death of their chairman, Mr. Ernest Turner, F.R.I.B.A., who was one of the members of the original Council of the Sanitary Institute of Great Britain in 1877, and retained his seat on the Council of the Sanitary Institute up to the time of his death. The Council desire to record their appreciation of his unremitting devotion to the cause of public health, and to the Institute with which he was so long and so prominently connected. The Council would wish to convey to Mrs. Turner and the members of the family their sincere sympathy in the great loss they have sustained."

TEYNHAM CHURCH, KENT.

AT the church of Teynham, Kent, an accident has led to a discovery which is of considerable interest to the antiquary and archæologist. The west door has recently undergone a renovation, and the removal of all superficial covering has disclosed a very fine massive oak door in an admirable state of preservation. The most noticeable feature about the door is that it is scarred in several places with bullet marks. The white paint formerly concealed these marks from view. Now, however, they are to be seen clearly enough. There are eight distinct bullet marks, and in some of the punctures the leaden bullets still remain embedded in the door. In one or two instances the door, massive though it is, has been penetrated by the bullets, which are not all of the same bore, some being distinctly larger than others. There is evidence in support of the theory that these bullets were fired into the door by some of Cromwell's soldiers when they were engaged in their work of spoliation and desecration of Kentish churches. Teynham Church, like others in this neighbourhood, is known to have sustained considerable damage at the hands of the Roundheads. All the stained-glass windows were destroyed, this work being presumably accomplished from outside the building. The assumption is that when the church was attacked the large west door was closed against the intruders, and that the Cromwellian soldiery, in order to force an entrance, fired at the door in the manner described. The bullets are of extraordinary size, giving the appearance of having been fired from muskets of large bore, which used to be fitted with a resting-piece, and were fired from a stationary position. In addition to the bullet holes the surface of the door is charred in one or two places, giving the appearance of an ineffectual attempt to fire the door having once been made.

TESSERÆ.

Counties Palatine.

COUNTIES palatine are so called a *palatio* because the owners thereof—the Earl of Chester, the Bishop of Durham and the Duke of Lancaster—had in those counties *jura regalia* as fully as the king had in his palace *regalem potestatem in omnibus*. The peculiar jurisdiction and form of proceedings of the courts of law in the county palatine of Lancaster are the result of those privileges which were granted to its early earls and dukes to induce them to be more than ordinarily watchful against the predatory incursions from the Scotch border, and to prevent their tenants from leaving the territory defenceless and exposed to hostile aggressions, while seeking redress at the more distant tribunals of the realm. Law was to be administered by the officers and ministers of the duke, and under his seal; and anciently all offences were said to be against his peace, his sword and dignity, and not as now "against the peace of our lord the king, his crown and dignity."

The king's ordinary writs for redress of private grievances, or the punishment of offences between man and man, were not available within the county palatine, such writs then ran in the name of the duke; but in matters between the king and the subject the palatine privileges could not contravene the exercise of the sovereign power, and the prerogative writs were of force lest injuries to the state should be remediless. Since 27 Henry VIII. all writs have run in the name of the king, and are tested before the owner of the franchise. Hence it is that all ordinary writs out of the king's court at Westminster for service in this county are addressed to the chancellor of the duchy, commanding him to direct the sheriff to execute them, and that all processes to that officer out of the chancery of the county palatine are not tested before the king or his justices at Westminster, as in other counties. The franchise and revenue of the duchy being under different guiding and governance from those of the crown, all honours and immunities and all redress within this county, with very few exceptions, must be derived from the chancellor of the duchy, as the principal minister of the king, in his capacity of Duke of Lancaster. Justices of assize, of goal delivery and of the peace are, and ever since the creation of the county palatine of Lancaster have been, made and assigned by commission under the seal of the county palatine, and the sheriffs for the county of Lancaster are appointed in the same way.

Chateau-Gaillard.

The ruins of Château-Gaillard, that key of Normandy, reveal Richard I. in the character of a great captain and subtle engineer. The very situation of the place was chosen with rare skill to separate the mighty French forts of Vernon and Gisors, to command the Seine, cover Rouen, and be a strong coign of vantage over his enemy's country. Nor were the details of the plan itself less remarkable for strategic skill. Over against a bold peninsula, two sides of which were covered by the Seine, Richard erected, firstly, a strong octagonal work, with ditches, palisades and towers, upon a little island situate just at the apex, connecting both banks by a wooden bridge. This commanded the river and secured communication between the contemplated fortress on the one hand and the opposite shore on the other. He made the *tête-du-pont* on the right bank opposite the peninsula large and strong, so that it soon held a small town, styled Petit-Andely. Behind this, by retaining the waters of two streams which joined the river there, an immense moat was formed which completely isolated the bridge, *tête-du-pont* and camp from that, the enemy's, side. At the head of the lake or moat, the Grand-Andely was strongly fortified and ditched. These works still exist. Upon a promontory rising more than a hundred yards above the Seine was planted the principal fortress, advantage being taken of every projection of the rock; towards the south a very narrow tongue of land served to link this promontory to the surrounding hills. At the base of the escarpment and enfiladed by the castle a stockade, composed of three rows of piles, was placed across the Seine, which was further protected by palisaded works along the side of the right bank, also a wall descending from a tower built halfway up the hill, and a fort lower down the river, guarding its flank. The peninsula was thus secured. The single attackable point of the fortress was the tongue of land. In front of this was erected a strong and lofty tower, the parapets of which attained to the level of the topmost plateau, and commanded the summit of the hill; this was flanked by two others, connected by curtains to it, which, diverging, were united again by another curtain, forming on the whole a triangle; at the points of union were placed two more lofty towers. This work had therefore five great towers, and was nevertheless but an advanced defence for the citadel, from which it was divided by a deep ditch cut in the solid rock, and portion of an escarpment carried all round, and down to the river. On the other side of the fosse, and parallel with the base of the triangle, ran a curtain, at whose ends stood two more tall towers commanding the former; from this the curtains ran backwards to a further pair of towers, somewhat wider apart than the last; thence the walls followed the natural form of the rock and enclosed the great central donjon. From the walls of this, again, sprang the fortification of the "interior castle," sweeping in an irregular ellipse, whose long diameter was about 70 mètres (the whole castle, with the outwork, being about 180 mètres). A peculiarity in the construction of the *enceinte* of the internal castle characterises the genius of the royal engineer; it is formed of a succession of segments of a circle, the chords about 3 yards in length, connected by portions of curtain-wall not more than 1 yard long; consequently the attack of such a wall, loopholed as it was, was a serious matter indeed. The donjon within was not less admirable as proof of art. The castle was furnished with vast cellars, stables, offices, a chapel, a well and tunnels bored in the rock. In addition to the out-works first named, there were numerous towers and flank-works stepped along the cliff and down upon the river bank. Proofs of design of the highest order exist throughout. One year had sufficed for Richard to erect all these enormous works and the whole system of defences which was attached to them. Well

might he exclaim, in his heart's pride, "Is she not fair, my daughter of a year!" when he beheld them completed.

The Palace of Az-zahra.

The palace of Az-zahra is one of the familiar names of the romance of Spanish history. It is known to all the world how Abdurrahman, to gratify the capricious fancy of a beautiful and beloved mistress, expended millions and tasked the labour of thousands in erecting on the plain beyond Cordova a fairy palace and city which might bear her name and be her own. And like a fairy fabric did Az-zahra vanish, for so utterly was it destroyed during the wars and civil tumults attending the fall of the race which raised it, that at the present day not a stone can be found, not a vestige even of the foundations traced, to show where it once stood, and all that we know of this "wondrous freak of magnificence" is drawn from the glowing accounts of contemporary writers, who saw it during the brief period of its glory. It is principally from Ibn Hayyan that Al-Makkari has copied the details of this marvellous structure, with its "15,000 doors, counting each flap or fold as one," all covered either with plates of iron or sheets of polished brass, and its 4,000 columns, great and small, 140 of which were presented by the Emperor of Constantinople, and 1,013, mostly of green and rose-coloured marble, were brought from various parts of Africa. Among the principal ornaments were two fountains brought from Constantinople, "the larger of gilt bronze, beautifully carved with basso-relievo representing human figures," the smaller surrounded by twelve figures, made of red gold in the arsenal of Cordova; they were all ornamented with jewels, and the water poured out of their mouths. The famous fountain of quicksilver, which could be set in motion at pleasure, was placed in the Kasr-al-Kholaiifa, or hall of the caliphs, "the roof and walls of which were of gold, and solid but transparent blocks of marble of various colours; on each side were eight doors fixed on arches of ivory and ebony, ornamented with gold and precious stones, and resting on pillars of variegated marble and transparent crystal, and in the centre was fixed the unique pearl presented to An-nassir by the Greek emperor." The mosque and baths attached to the palace were on a corresponding scale of magnificence, and the number of inmates, male and female, is said to have been not less than 20,000. The expenses of the establishment must have consumed the revenues of a kingdom, if we are to believe the statement that 12,000 loaves of bread were daily allowed to feed the fish in the ponds. "But all this and more is recorded by orators and poets who have exhausted the mines of eloquence in the description," says Al-Makkari, who, after enlarging upon "the running streams, the luxuriant gardens, the stately buildings for the accommodation of the guards and high functionaries, the throngs of soldiers, pages, eunuchs and slaves, attired in robes of silk and brocade, moving to and fro through its broad streets, and the crowds of judges, katibs, theologians and poets, walking with becoming gravity through the spacious halls and ample courts of the palace," concludes with a burst of pious enthusiasm. "Praise be to God who allowed those contemptible creatures (mankind) to build such palaces, and to inhabit them as a recompense in this world, that the faithful might be stimulated to the path of virtue, by reflecting that the pleasures enjoyed by their owners were still very far from giving even a remote idea of those reserved for the true believers in paradise."

Palladio's Treatment of the Orders.

Palladio scarcely ever repeated himself in any of his numerous compositions; he had at his disposal all the means, all the combinations which the elementary parts of architecture could furnish, and he had the art of moulding them to his use, without ever exceeding the just medium which the art permits. His orders are elegant, and he did not scruple to vary the proportions of an order, according to the nature of the building to which it was to be applied; he generally made the heights of his columns, when used in a particular storey only, equal to the width of his principal rooms; a circumstance probably accidental, but which might have suggested itself from the rule, established by Vitruvius in the case of a circular temple, for making the heights of the column equal to the width of the cell. Palladio adapted the composite and Corinthian orders to enclose two storeys of apartments. He was extremely partial to the use of the Ionic order, yet the others, particularly the Doric, were frequently employed by him; he occasionally made use of insculcating columns, a practice not to be recommended for adoption. If the front of the house in which Palladio lived is truly of his own design, he committed a great error in giving the Tuscan base to both the Ionic and Corinthian orders employed therein. It is true it is used at the Coliseum in the Corinthian order, but in so immense an edifice a small part being irregular is, perhaps, not of so much consequence, as from the elevated and combined situation it appears no more than a speck; but where it is brought so much nearer the eye, as in a private dwelling, any irregularity must certainly be considered as a violation of the

rules of architecture. Palladio occasionally used insulated pilasters, and Inigo Jones rendered them much more familiar to us. Palladio left the columns and pilasters plain when used at the ends of porticoes, and most of the school have followed his example. He was generally particular in applying a single order to each storey it was intended to decorate, though in large buildings he had no objection to introduce at the angles a tier of mezzanine windows, occupying perhaps four storeys in height; the larger orders he retained for his entrance-halls and courts, with small pilasters behind them to carry the floor of the gallery. His favourite display of the orders seems to be the Doric and Ionic, then the Ionic, and thirdly Ionic and Corinthian. Of the first, the Chiericato Palace affords a good example; the second appears mostly in the porticoes to the country houses; the third is shown in the house at Udine. He also used the Ionic alone with good effect on a rustic basement, and in the same way the Corinthian. The upper orders are sometimes placed on pedestals and sometimes not, and the pedestals are as often found without plinths, both arrangements seeming to depend upon the position of the windows and the height of the storey. The lower columns were placed upon plinths or surbasements; the larger orders generally upon pedestals, to give additional height to them. These peculiarities of manner are only observable in the works themselves, for he has not left any directions concerning the composition or design of edifices, the only glory of the architect. Decorations, however they may affect the less educated, are least regarded by the judicious eye. In windows having columns for part of their enrichments he generally used the order ranking under that employed as principal. All these peculiarities are seen in the school, but after the time of Jones the lesser orders were not so generally adopted, but the larger were employed to decorate the whole height of the façade; while another characteristic at that period is the use of the space under the entablature of the Corinthian order, formed between the caps of the columns and the continued necking, which space was usually decorated, sometimes extravagantly so by festoons, with masks and other ornaments. Palladio's designs, which have been such happy models for architects, abound, as has been shown, with various instances of the different dispositions of the orders, but he has not always trusted to them for the effect he required; in some places he has introduced arcades, and in others, even plain walls, under his skilful direction, make an elegant appearance.

Rubens's Composition.

The composition of Rubens is indeed the most ornamental of any painter; and more than any other delights in the play of serpentine lines, rejecting as much as possible everything rigid and formal. Who would indeed wish it other than it is, excepting in character and form? and in reference to these we should certainly prefer another Moses and another Aaron in the place of those in his *Brazen Serpent*, and we should all agree that his Venus scarcely vindicates the taste of Paris. Whatever appearance of art there may be in the arrangement of Rubens's materials, it is always so much under the influence of natural principle, and there is so much of life and of energy and unity of purpose in him, that painting would have wanted a great and splendid feature had he never appeared. Indeed he reconciles us to a degree of artifice which, instead of being objectionable to him, makes his style, compared with that of others, something like the difference between verse and prose. Even the ostentation of art in Rubens sits gracefully on him. He is not to be censured for wanting simplicity of line, for his aim is to unite the utmost intricacy of beauty of which composition is capable with the greatest possible breadth—an aim in which he has entirely succeeded. Rubens is the great painter of action; in such works as *The Battle of the Amazons* and *The Fall of the Damned* there is an impetus in the struggling and falling groups which we find nowhere else, excepting in Michel Angelo's *Last Judgment*; and it was not ill said of one of his hunting-pieces, founded on Leonardo da Vinci's *Battle of the Standard*, that "it seems as if painted on horseback." But it is the besetting sin of genius so animated as that of Rubens to delight itself beyond bounds with what it can do best, and movement composition sometimes carries him into mannerism. There is in the Louvre a small and slight work of his masterly hand, the subject of which is a village festival. It contains not less than 100 figures, and of these scarcely one or two are not in motion, dancing, romping and rolling on the ground, while even of those who sit on benches or on tables not one appears to be able to sit still. It is a wonderful display of the most difficult attitudes, mastered with consummate ease, but the whole together is too far removed from the probabilities of nature; and any picture of the younger Teniers of a similar subject placed beside it would show at once how much the truth is to be preferred to such splendid falsehood. And yet Rubens could be simple, and is often and most so in his landscapes, and particularly where they are, as is frequently the case, transcripts of nature. The beautiful *Moonlight*, once in the possession of Rogers, the poet, by his hand, is a scene of

such perfect stillness that you would seem to hear a horse in the foreground cropping the grass; and there are others of his landscapes, of which the engravings by Hendrix are common, as simply natural as are many of Gainsborough's.

Children in Raphael's Pictures.

In nothing does Raphael appear to more advantage than in the introduction of children into his compositions, and he was extremely fond of introducing them whenever the subject allowed him. A fault of many painters in their representations of childhood is that they make it taking too great an interest in what can only concern more advanced periods of life. Raphael's children, unless the subject requires it should be otherwise, are, as we see them generally in nature, wholly unconcerned with the incidents that occupy the attention of their elders. Thus, the boy in the cartoon of *The Beautiful Gate* pulls the girdle of his grandfather, who is entirely absorbed in what St. Peter is saying to the cripple. The child, impatient of delay, wants the old man to move on. In *The Sacrifice at Lystra* also the two beautiful boys placed at the altar to officiate at the ceremony are too young to comprehend the meaning of what is going on about them. One is engrossed with the pipes on which he is playing, and the attention of the other is attracted by a ram brought for sacrifice. The quiet simplicity of these sweet children has an indescribably charming effect in this picture, where every other figure is under the influence of an excitement they alone do not partake in. Children in the works of inferior painters are often nothing else than little actors, but one of the very greatest distinctions of Raphael which separates him from most of his imitators is that his expressions are always genuine, never acted. This is a difference that cannot be described; it can only be felt, but it places him still higher than even his invention, his skill in composition, or his grace; though indeed of the last it is the great charm that it is never acted grace.

Teniers's Styles.

The early works of Teniers invariably partake of a brown tone of colour, and such appear to have been painted previously to his thirtieth year, about which period he gradually quitted these predominant brown tints and adopted a much more clear and what is termed silvery manner of colouring. Many of his finest works are dated 1647. In his latter time his handling became feeble and tremulous and his colouring less transparent, with a tendency to a yellow brown. The vehicle or medium used by him in painting was evidently of the same kind as that with which Rubens, Breughel, and other artists of that school worked; and, whatever this medium may have been, it is plain that it possessed two very important qualities, namely, of giving transparency to the colours, and being a convenient texture for its application; for nothing short of these, in conjunction with a perfect knowledge of the principles of the art, could have enabled him to produce such an incredible number of pictures, many of them filled with a multitude of figures displaying the most lively animation and an infinite variety of action. The pictures most esteemed by connoisseurs are those painted on a light ground, formed with a preparation of chalk or plaster of Paris, over which he scumbled his various tints of brown and pearly grays; the figures, and some of the accessories, were at the same time spiritedly sketched in with bistre, and the principal shadows thrown in; these were succeeded by the half-tones, taking always especial care to preserve delicacy and transparency. In the finishing all the higher lights, and whatever required solidity, were charged with a body of colour; a few sparkling and spirited touches, and occasional glazing tints, completed the work. Some idea may be formed of the extraordinary number of pictures produced by this expert painter by a quotation of his own words, "that it would require a gallery two leagues in length to contain all his pictures."

Ancient Paintings.

There is no doubt a certain degree of sameness in the ancient Greek and Roman paintings which have survived. The Romans only copied themselves and the Greeks, therefore they had not that range over all ages and all situations which is open to modern art. The Greeks, who only depicted themselves, and an occasional Persian or Amazon, were still more confined as to models. The shading of a modern picture is generally artificially contrived by a light let in by a small window, or even a small hole in a shutter purposely closed, and which produces an effect rarely observed in nature. The ancients, on the contrary, seem to have preferred the light of day for their works, and one curious advantage is gained by it. The pictures of the ancients produce a pleasing effect when only surrounded by a simple line of red, while the very best of modern paintings is very much indebted to the carver and gilder for its gorgeous and burnished frame, without which its beauties are so much diminished that it almost ceases to be a decoration to an apartment.

NOTES AND COMMENTS.

A COLLECTION of historical and architectural notes on Whitehall by the Rev. W. J. LOFTIE forms the latest monograph of the *Portfolio* series. The subject is interesting, and Mr. LOFTIE has often demonstrated his acquaintance with all that can be known about London. The illustrations are from rare prints. Mr. LOFTIE is occasionally severe on modern architects, and he is surprised that INIGO JONES's design for Whitehall was not realised when it became necessary to erect new Houses of Parliament. But we presume he does not expect that anything he can say will make the public undervalue architects. Mr. LOFTIE concludes that JONES when he designed his palace only "made these beautiful drawings for his own pleasure, a kind of vision which he knew could never be realised" on account of the expense. How could he tell the extent of the king's accumulations or estimate the yield from subjects' purses? The design is so well adapted to the site one cannot take it for a castle in the air.

ON Wednesday the half-yearly meeting of the Court of Governors of the University College, North Wales, was held in Bangor. It was announced by the principal, Dr. Reichel, that the council had passed a resolution asking the Court of Governors to appoint six of their number to act with a like number of the council and delegates from the Bangor City Council, to consider the question of providing additional building accommodation at the college, rendered necessary by the large increase in the number of students. The council could see their way to provide temporary increased accommodation for the next session, but owing to the large expenditure involved did not like to act in the matter of permanent accommodation without the co-operation of the court. Accordingly six of the governors were selected to consider the subject.

BUILDING in New York is not always the creating of structures that will last for ages. There is an official building department in the city, but as happens often with authority in America, it can occasionally display inactivity that in a political sense may be masterly, but not in any other. A disaster which has occurred in Orchard Street has opened men's eyes to the dangers which some builders are preparing, and there is an outcry against official and other negligence. Among other bodies the grand jury have taken the trouble to recommend a reorganisation of the Department of Buildings on the following basis:—(1) The appointment of a superintendent of buildings who shall have been for ten or more years in active practice as an architect or civil engineer, or engaged in business as a builder. (2) A deputy superintendent of buildings as above. (3) A civil engineer to be chief of the engineer's department, who shall be a graduate of a recognised scientific school or college. (4) Two assistant engineers qualified as above. (5) A clerical force necessary for the work of the office, to be composed of persons familiar with plans and building operations. (6) The district inspectors, those at present acting, to appear before a competent board and be examined as to character and fitness to discharge their duties, and such only as shall pass a satisfactory examination to be retained, present and all future vacancies in the department to be filled by graduates from the architectural or engineering departments of recognised schools or colleges. (7) The sanitary department may be left as at present constituted. (8) An advisory board constituted as follows:—Two architects, one to be appointed by the mayor and one by the local chapter of the American Institute of Architects; one civil engineer, to be appointed by the local society of civil engineers; one sanitary engineer and one mason builder, each appointed by the three members first above named; one member of the Board of Fire Underwriters, appointed by that organisation and the superintendent. Members of the advisory board to meet at least once a week, and be paid 10 dols. each for every session. The duties and powers of the board shall be to exercise a general supervision of the work of the building department, in addition to which it shall have the appointment of and shall fix

the salaries for all *employees* of the building department, except that of superintendent of buildings. A majority of the board as above constituted shall be competent to act. (9) No existing building to be torn down, demolished or removed without a permit from the Department of Buildings. We also recommend that no building be erected hereafter or changes or alterations made to an existing building without the employment of a duly licensed architect, who shall furnish the necessary plans and specifications of the same and superintend the same from first to last during its progress. No person to practise the profession of architecture, make plans and specifications for a building or superintend its erection unless duly licensed for that purpose and registered. In reorganising the department we would suggest that a separate class of inspectors be appointed for ordering and locating fire-escapes and passing on their construction, and whose duty it shall also be to examine and report all buildings regarding the posting of notices called for by law respecting the weight allowed to be carried per square foot of floor space. The great objection which will be raised against the proposal is that so little is made of political qualifications.

THE report by Captain J. H. THOMPSON, R.A., Her Majesty's Inspector of Explosives, on the circumstances attending the explosion which occurred at the dynamite factory of NOBEL'S Explosives Company at Ardeer, in Ayrshire, on January 5 of this year, makes it evident that specially adapted construction will be needed in all buildings where explosives are made or stored. It appears that on the day in question a fire broke out in a building licensed as a laboratory magazine to contain miscellaneous explosives, and while the factory fire brigade were endeavouring to extinguish it a violent explosion occurred, causing the death of two men and severe injuries to two others. Captain THOMPSON mentions three possible causes of fire in the building, namely, ignition of the roof by a spark from a chimney or locomotive, ignition of the woodwork by long-continued proximity to the steam pipes, and the spontaneous ignition of one or other of the explosives. Of these the third he holds to be far the most probable, and therefore he discusses it at some length. He points out that all nitro-compounds are more or less liable to decomposition by prolonged exposure to high temperature. This decomposition is attended with an evolution of heat, and if it takes place sufficiently rapid the heat evolved may suffice to cause ignition. Captain THOMPSON therefore thinks it probable that one of the smaller samples on the shelves first ignited and set fire to the woodwork, and that the explosion was due to a burning fragment of wood being projected on to some boxes in the middle of the building. He attaches no serious blame to any one, and notes that with a view to prevent accidents of a similar kind in the future the company propose to make several alterations in reconstructing the building.

FROM the annual report it appears that the condition of the Sheffield Society of Architects is satisfactory. There is a balance in hand of 64*l.* 0*s.* 6*d.*, which exceeds the wealth at the beginning of the year by 59*l.* 12*s.* 6*d.*, and while subscriptions are owing there are no liabilities. Allusion is made in the report to the award of the School Board with respect to a school at Tinsley Park, which was so much at variance with the conditions that the competitors sent a protest to the Board, and the Council forwarded a letter of complaint, but no satisfactory reply was received. Visits to Wentworth House and Hardwicke Hall are contemplated. The following officers have been elected:—President, Mr. CHARLES HADFIELD; vice-president, Mr. R. W. FOWLER; treasurer, Mr. F. FOWLER; hon. secretary, Mr. C. J. INNOCENT; council, the above officers and Mr. T. J. FLOCKTON and Mr. E. M. GIBBS (ex-officio), and Messrs. T. WINDER, J. SMITH, W. H. LANCASHIRE, H. W. LOCKWOOD and W. C. FENTON. Messrs. F. W. CHAPMAN, C. M. HADFIELD, C. F. INNOCENT, J. B. MITCHELL-WITHERS and J. R. WIGFULL were elected a committee to manage the sketching class.

THE RUINS OF TIMGAD.

A CORRESPONDENT of the *Journal de Genève* supplied the following interesting account of a visit to the ancient city of Thamugadi:—

I have just seen a marvel, that is Timgad, a Roman city of which the ruins have an area of nearly 250 acres. Forgotten by history during many centuries, it arises slowly from the ground, thanks to the excavations there conducted for two years and a half. It is another testimony to the power of the Roman people. The ruins are situated at a distance of 24 miles from Batna in a south-easterly direction.

The road, which is in good condition, passes through Lambèse, which was formerly the principal quarters of the third legion of Augustus. The Roman camp measures 500 mètres by 420 mètres. In the enclosing wall were four gates, of which two have survived. At the intersection of the principal roads is found the prætorium, or offices of the commandant of the legion. It is quadrangular, and measures 33 mètres by 30 mètres. It is in tolerable condition. The façades are 15 mètres high to the cornice. The interior, which is open to the sky, has been converted into a museum, where we see fragments of statues, inscriptions, gravestones or votive records found at Lambèse or at Timgad. In the environs of Lambèse are two triumphal arches, one dating from the time of Commodus; the other, which is the more beautiful, from the time of Septimus Severus. There are also the ruins of two temples, one of which was dedicated to Esculapius and Hygeia jointly. The second was dedicated to Jupiter, Juno and Minerva. They are in a more ruinous state than the prætorium, and they could hardly be otherwise. The materials of the ancient Lambèse were utilised to construct the city of Batna, which dates from 1849, as well as the new Lambèse, which occupies a part of the Roman city, and also to build the great penitentiary, a large building containing 900 prisoners. From this it is evident that the Vandals have had successors.

Thamugadi, wrongly called Thamugas by some scholars (the Arabs called it Timgad), occupies a site that has an altitude of between eleven and twelve hundred mètres. About twenty years ago an Englishman, Mr. Playfair, drew the attention of his countrymen to the ruins. They remained, however, neglected until M. Ballu, the architect in chief of the historic monuments of Algiers, ordered excavations to be commenced, which have been crowned with astonishing success. The resurrection of Thamugadi must be ascribed to his influence.

The Algerian Pompeii dates from the first century of our era. It was traversed by two principal highways, of which the pavement in blue limestone from El-kantara has been found in a perfect condition at a depth of about 10 feet. The stones are of large size, sometimes measuring more than a metre and a half in length. They are deeply furrowed by the wheels. The sewers ran under the road, and could still be utilised. The *latrina publica*, which have divisions marked by dolphins carved in stone, have a monumental character that is no longer given to such places.

Numerous monuments surround the forum of the city. On the east side is a grandiose basilica measuring 38 mètres by 20 mètres, the curia and the Temple of Victory; a portico in the form of an elegant colonnade surrounded the place, with the exception of the part before the tribune, which was left open in order that the orator could be seen by the crowd. From the forum a passage led direct to the theatre. The lower ranges of seats are intact; thirteen columns out of fifteen remain, but in a truncated state. About 4,000 spectators could be accommodated in the theatre of Thamugadi. The greatest width is 63 mètres, which exceeds by 3 mètres the theatre at Philipville. At Taormina the width was about 108 mètres.

The culminating point of the city was occupied by the capitol. There was erected a temple dedicated to Jupiter, Juno and Minerva. The proportions were colossal and the style Corinthian. It was approached by thirty-eight steps; the height of the columns was 14 mètres, the diameter of the shaft at the lower part was 1.44 m. The capitals measure 1.58 in height. From the terrace of the temple the whole extent of the city was dominated. The soil is strewn with *débris*, and trunks of columns emerge here and there.

At a little distance from the capital at the road which leads to Lambèse is a majestic triumphal arch. It was constructed

by Trajan in the year 100, and has three openings. It was adorned with niches, statues and columns in the best Corinthian style; unfortunately it has suffered much from earth tremors, stones and columns are disjoined, and it has been found necessary to construct arches of masonry in the interior in order to sustain the structure.

What is more important than Trajan's Arch, or the theatre or the baths or the forum or the basilica, is the market or *macellum*. A portico with eight columns, of which the bases alone remain, led to a rectangular court, with a fountain in the middle. At the end, which was semicircular, are the remains of the shops of the merchants with stone tables. They afford an idea of one phase of Roman life. We can assist in imagination at the everyday transactions between buyers and sellers, and neither at Rome nor at Pompeii is it so easy to reconstruct an antique market as at Thamugadi.

Although the initiative of the excavations must be ascribed to M. Ballu, credit is also due to Felix Watin, architect, who was the conservator of the ruins. He has directed the operations with all the competence of an enthusiastic archæologist. He has collected in a small provisional museum, which is not yet open to the public, a great many rarities, including amphoræ, vases, utensils, fragments of fine statues, tragic masks, about 3,600 Roman coins, which will be kept in a bath of oil for four months, a Roman balance with a series of weights in polished stone, and other things.

The thickness of the soil which has covered the ruins is of an average depth of from two and a half to three mètres. The sum allowed for excavations is 40,000 francs a year. The works are suspended during the winter and are resumed in spring. The men confined in the penitentiary are employed on the works. For restorations M. Watin hires masons at Batna or at Lambèse. They are mostly Italians or masons from Ticino; the latter are the best workmen. Up to the present not one Frenchman has offered his services.

This year it is proposed to operate on the ground between the baths, the capitol and the market, and a successful result is anticipated. As showing the interest taken in the ruins, it may be added that about 600 tourists visited Thamugadi during last year.

THE VIA APPIA.

THIS road was first constructed by Appius Claudius, the censor, 310 years before the Christian era. It was, indeed, repaired by the Emperor Trajan, but about nine hundred years after its foundation the secretary of Belisarius saw it in all its pristine solidity. So durable is "the queen of roads" that between Rome and Capua may often be observed the foundations and materials of which it was built. It will be so seen near the tomb of Cæcilia Metella. The substructions in the valley of Aricia are still the wonder of posterity; it traversed the Pontine marshes by the well-known places of the Three Taverns and Appii Forum, and the first town in the Neapolitan territory is built amongst its everlasting silex stones. The description given of this road by Procopius in the sixth century of the Christian era may here be seasonably inserted:—"To traverse the Appian way," says that historian, "is a distance of five days' journey for an active traveller, and it leads from Rome to Capua. Its breadth is such that two chariots may meet upon it and pass each other without interruption, and its magnificence surpasses that of all other roads. For the construction of this great work Appius caused the materials to be fetched from a great distance, so as to have all the stones hard and of the nature of millstones, such as are not to be found in this part of the country. Having ordered this material to be smoothed and polished, the stones were cut in corresponding angles, so as to fit together in jointures without the intervention of copper or any other material to bind them, and in this manner they were so firmly united that in looking at them one would say they had not been put together by art, but had grown so upon the spot. And after the wearing of so many ages, being traversed daily by a multitude of vehicles and all sorts of cattle, they still remain unmoved; nor can the least trace of ruin or waste be observed upon these stones, neither do they appear to have lost any of their beautiful polish. And such is the Appian way." Twelve centuries since the time it was so have not entirely defaced it, and perhaps the children of ages yet to come may tread the pavement of the Via Appia. Still, no more shall the conqueror be seen moving along this road to enter the city in triumph; nor will the steps of the temple ever again be crowded to welcome the return of a Cicero from exile.

The Duke of Westminster has decided to have a light railway from Chester to Eaton Hall, on similar lines to the narrow-gauge railway laid down on the estate of Mr. A. Percival Haywood at Duffield Bank, near Derby. The cost, including equipment, is estimated at about 1,200*l.* per mile.

EXCAVATIONS AT ST. ANDREWS.

A CORRESPONDENT of the *Times* gives an account of the excavations at St. Andrews undertaken by the Marquis of Bute. In the course of it he writes:—

Nothing seems to have been done in the way of excavating at St. Andrews till 1879, when Providence showed the way dramatically enough. Some stonemasons were at work on the foundations of a new house just outside David Beaton's Castle. One man wheeling his barrow over a heap of rubbish felt the earth give way beneath him, and incontinently disappeared, barrow and all; he had fallen into what is now known locally as the Castle Passage. The place was duly examined and proved to be an undeniable subterranean alley, vaulted and floored by human hands, and running in a straight line from the castle towards the cathedral for a distance of 90 feet; there it was blocked by the wall of a house. It is provoking to think that in 1879 the house in question had only begun to be built, and that nothing but the anxiety of the builder prevented the passage from being pursued to its natural end. That, no doubt, is in the cathedral, where some people believe there is a crypt, and in the crypt the treasure of all the Fifeshire monasteries, which, tradition avers, used to be kept at St. Andrews as in a money-box in troublous times. But the melancholy fact is that Mr. Hay Fleming, the well-known Scotch archaeologist, and the only authority on the matter, thinks there is no crypt, and scouts the idea of hidden treasure. Fancy loves to think that Mr. Fleming is wrong, and at least in 1879 the truth might have been known. But between the virtuous indignation of an architect and builder and the curiosity of mere amateurs it is an unequal battle. No antiquary took the matter up; Mr. Linskill, a name well familiar to golfers and the chief leader in later excavations, was not then in St. Andrews, and the chance was lost. Let us be thankful that the passage was not closed up altogether, as was actually proposed at the time. As it is, its 90 feet may be explored by any one who does not fear a dusty jacket. Entering by a wicket of red brick which has been put up under the ivied wall of the castle, such an adventurer finds the way descend abruptly at a height of 14 feet and a breadth of 5 feet, with a groove cut in the rocky floor, until it widens suddenly and falls upon a lower storey. This is reached not without difficulty and a ladder, when the explorer finds himself in a room about 14 feet broad and 10 feet high. Passing through this he will come to the foot of a wide staircase cut in the living rock. There are 34 steps, and then comes the obstructing wall. In this room there are stone tables, shelves and chairs; and worth noticing also are the *culs-de-sac* which diverge from the main passage close to the entrance, one of them going to the length of 21 feet westwards, the other turning eastward for only 5½ feet. They are usually explained by the theory that the builders were trying for the nearest way to the cathedral.

The Castle Passage, so fortuitously discovered, remains the only authentic trophy of its kind. Its discovery, of course, set people trying for other subterranean alleys, and in those days Mr. Linskill's informal society was formed for their pursuit. But the records of the Society are rather plucky than exultant reading. Several bits of passages have been found or have seemed to be found; they have invariably blocked at crucial points. Of these the Pends Passage was the most notable. It was discovered in 1884, when a plumber—his profession alone ought to have discredited him—declared that he had come upon something similar to the Castle Passage fourteen years before when he was laying the gas-pipes of what was then the College Hall. The excavators pierced a road running south of the priory at the point indicated by the plumber, and in two days' hard work disclosed a most promising and satisfactory passage. They explored it for about 70 feet from the entrance, but encountered then the wall of the priory and a vandal—in its proprietor of that day—who sternly forbade them to go further. So the Pends Passage was filled up and remains a pleasant reminiscence, for the hard labour it cost—given by more than one working man gratis—and for the interest which Bishop Wordsworth took in it. Its mystery, however, is dissipated, for Lord Bute's digging within the priory has proved it to be little better than a drain. The conclusion of the whole matter seems to amount to a strong probability that there are many other passages if they could but be come at. What chance discovered once in the instance of the castle chance will probably discover again, and, considering its history, St. Andrews may well be honey-combed with such hidden exits and entrances. Perhaps the most interesting word on the subject was that of an old stonemason who was near his end when the Castle Passage was discovered. He recalled the year '30 and the tardy removal by Government of the rubbish which had been allowed to accumulate at the ruined cathedral. One day a mass of stones, great and little, was pushed aside, and, lo! the first steps of a winding staircase lay open to the air. The foreman ordered it to be covered over, and accordingly it was covered over, but

his comment was startling. "Oh," said he, "it'll just be one of they staircases that go down to the sea." He was used, this foreman of the year '30, to such disclosures.

The priory was built about the beginning of the present century, and, if vengeance waits below upon Philistines, the first proprietor's case is pitiable. It was not enough to build—hideously—on the site of the Hospitium Vetus; he must erect a hothouse against the south wall of the cathedral, which bounded his garden, and, walling up the arches which led up to the cloister, train apple-trees thereon. Mercifully Lord Bute bought the priory in 1893, and henceforward there is an end of vandalism there. The monastic buildings were these:—There was the prior's house, or Hospitium Vetus aforesaid, which was founded about 1140 by Bishop Robert and by King David, that "Sair sanct for the Crown;" this was repaired by Bishop Lamberton. Then there were the cloisters, of which Bishop Arnold laid the foundation-stone in 760; the refectory, built by Prior John White before 1258; the great hall, or Magna Camera, in the east of the monastery, which Prior John de Haddington built about 1300; the Seintie House, known also as the sub-prior's house; and a chamber adjoining the cloister was erected by Prior John de Forfar and used by Prior William de London (in 1385). Among those who did most to improve and ornament the monastery was Prior James Holdamstone; among other pious acts he constructed what was called a "handsome palace" in the court of the Prior's Hospitium. Knox's famous sermon on Christ purifying the Temple, preached in the parish church on June 11, 12, 13, 14, 1559, made an end at once of the monastery and of the cathedral, and George Stewart was the last prior. After the Reformation the ground fell into the hands of the Duke of Lennox, who sold it to King Charles I., who in turn gave it to the Episcopalian See. The last of the buildings to go was the Seintie House, which was inhabited as late as 1805. In the Seintie House was held an eponymous market, one of the greatest of Mediæval fairs, and attended by merchants from all parts of Europe; the monks presided over this so long as there were monks at all, and after the Reformation the provost (*Anglice* mayor) got leave from Government to hold the fair in the familiar place.

Lord Bute began to excavate in October 1893 without, so far as one can gather, any fixed design. He dug first about the site of the sub-prior's house, now used as the coal-cellars of the priory, to the extent of 80 feet, but found nothing of any interest. Next he turned to the site of the refectory, a few steps south of the priory, having the cloisters on the north. The refectory, according to Martine, the murdered Archbishop Sharp's secretary, was 108 feet long. Here the crypt was laid open with several of its pillars standing upright. Pursuing something like the famous method of Zadig, Lord Bute has filled in the missing pillars and stones, these and all new buildings being erected in red stone brought for the purpose from Dumfries. Thus the grey stone of Mediæval builders and the red stone of those of to-day stand side by side, part of the same whole; and as the old masons' marks are plainly visible on their material, so their descendants have affixed theirs also, to each man's stone his own mark. At one end of the refectory the remains of a short flight of steps are visible; no doubt it led from the refectory to an antechamber. In the crypt there are also the remains of a roundel. What was its use? Lord Bute and his architect believe that it may have been a winding staircase, and point to a similar construction in Durham Cathedral. On the other hand, Mr. Logan, the tenant of the priory, suggests that the roundel may have been built to support an oriel window where the reader would stand during refecton. Mr. Logan adds that the roundel at Durham is not properly analogous; that the steps there begin at its lowest point, while there is no trace of a staircase at the foot of the roundel in the priory. But, of course, these matters are purely conjectural; there is not enough old stone left to determine the point. From the crypt of the refectory the way leads next to another chamber. This, too, is vaulted, a cloistered pillar standing in the centre, and a big fireplace stands in one corner. Probably this was the calefactory, where the monks repaired for warmth as they might nowadays for tobacco. There are marks on the walls where the monks have tried their knives, and have even drawn roughly, as in one case the arms of Prior Hepburn, with a pastoral staff and two leopards pulling at a rose. All this seems to imply that the room was a lounge. Martine, whom we have quoted above, speaks of "a faire, square roome," which they used for their copes and albs. Beyond the calefactory were offices connected with the prior's house, and here four pillars were found still standing in position. And next to the offices this rather dreary catalogue is enlightened by a point of comparatively living interest. Martine says that the entrance to the prior's house was by "a faire gateway," and here, as in Pompeii, the marks of carriage wheels are distinctly traced on the stone. The elation over this discovery was a trifle damped when it appeared that the entrance was not part of the original design of the monastic buildings. But only for the moment; the priors, it was remembered, only used a carriage in later times,

and a few paces south a narrower gateway was found, which the priors must have used originally and discarded in their carriage days for the wider way. South of this another vaulted room with the groining still in position was encountered, and further south the once mysterious Pends Passage, which, as has been said, Lord Bute believes to have been a drain. Some stone-heads were found in it at a depth of 10 feet, the effigies of saints from the cathedral thrown in at the hour of Knox's triumph. One of these is a head of Christ, the traditional *Ecce Homo*; another seems to be an effigy of St. Andrew, with traces of crimson on the garment, and of gold and pink tinting in the features; the third has the visage of Malcolm the Maiden. Only St. Andrew has escaped mutilation, he remains of a severe and Darwinian aspect. These relics, with a pipe of seventeenth-century make, are now in the priory.

Towards the St. Regulus's Tower stand, still above ground, the ruins of the prior's house. The doorway is of the architecture of the fifteenth century, and there are two separate vaultings not communicating. Probably the second was the stable; it stands opposite, as Mr. Logan points out, to the "faire gateway" mentioned above. A stone was found in the crypt of the prior's house with this mutilated inscription:—

Lux urbis Pars Magna
fui sivilibus hic
posuit Ra-
1582.

Outside the house were found some tiles of gun-barrel make, wound round a central core. Turning finally towards the south wall of the cathedral, you come on the remains of the ambulatory cloister and of the monks' dormitory, which extended from the end of the south transept westward. Here the interest is rather historical than antiquarian, for the sake of Prior Robert of Montrose assassinated by a lay brother in 1393. The assassin Plater lay in waiting at a turn of the winding staircase and stabbed the prior as he was going to bed. Two days later Plater was led out and preached at by Bishop Traill; he was then condemned to perpetual imprisonment. His death was a miracle of priestly tact. The ecclesiastical authorities had no power of life and death, and to get a man executed they must have handed him over to civil authorities, which naturally they were loth to do. "So partaking scantily of the bread of bitterness and the water of affliction he (Plater) was soon dead and was buried in a dungeon." In fact, he was merely starved to death.

And thus one may leave Lord Bute amid his excavations. He is only at a beginning of his labours; he will go far before he concludes them. We hope that he will carry his operations into the cathedral. Mr. Linskill at one time got leave to dig within its wall at certain points, and Lord Bute has a knowledge of archaeology denied to its earlier excavators. Only let him not think of building where he digs. To rebuild the old cloisters in the priory beside the south wall of the cathedral would be a lamentable waste of work for a ridiculous result. Conceive a new cloister raised against the wall of King Robert the Bruce! With this reservation Lord Bute deserves every one's good wishes and every one's confidence.

BRAMANTE AND ST. PETER'S.

THE little town of Urbino, which in the year 1883 celebrated the four hundredth anniversary of the birth of the great painter, Raphael Sanzio, has lately, writes Mr. R. M. Mereu, in the *American Architect*, celebrated the five hundred and fiftieth anniversary of the birth of the greatest architect of the Italian Renaissance period who, in 1514, died at the age of seventy years. The name of this grand artist is attached to that of the greatest of the Catholic monuments, the incomparable church of St. Peter, of which he was one of the chief architects. The anniversary was also commemorated by an address at the Technical Institute at Pesaro delivered by Professor Benedetto Passeri, a man learned in the history of art. At the back of the peristyle of the Institute there was unveiled, in the presence of the political and administrative dignitaries and of delegates from abroad, a bust of the celebrated architect, upon which was the inscription—

TO DONATO BRAMANTE,
PRINCE OF MODERN ARCHITECTS,
THE TECHNICAL INSTITUTE OF PESARO
PROUD TO BEAR HIS NAME.
MDCCCXCIV.

The occasion was as brilliant as possible and in all respects worthy of the man it was designed to honour. Bramante was assuredly one of the artists whose works most powerfully contributed to raise the reputation of the century to which he belonged. Chance willed it that he should also be the uncle of Raphael, so that the glory of the greatest of Italian painters and that of the grandest architect are involved one in the other and belong to one and the same family.

Bramante belonged to a poor family, but had at an early hour manifested a strong leaning toward drawing, though at first he seemed rather to incline toward painting, and his father who needed to utilise the budding talent put him to study in the studio of a painter of Urbino, Carnevale, under whose direction he executed several works of very secondary worth. He went to Milan, where he studied closely the celebrated Gothic cathedral, of which the imposing style charmed him and caused to spring up in his breast the inclination toward architecture. Shortly afterwards he arrived at Rome. He still lived by his brush, and he is credited with painting over the Porta Santa of St. John Lateran the escutcheon of Pope Alexander VI. But his penchant for architecture had already become firmly rooted and he devoted the greater part of his time to analysing and measuring all the remains of antiquity remaining in Rome and its environs. Next he spent some time in the south of Italy in studying Greek and Roman remains there. Returning to Rome, he gave open evidence of his intention of devoting himself to architecture, and the first one to encourage him to follow the new career was the Cardinal of Naples, who commissioned him to construct in travertine the cloister of the convent of St. Maria della Pace. Then little by little he was helped by the same patron to secure the construction of several monumental fountains, the Palazzo St. Giorgio, the church of St. Lorenzo in Damaso and other churches. He prepared the design for the palace of Cardinal Adriano da Corneto, at Borgo Nuovo, and he conceived and carried out the enlargement of the chapel of St. Maria del Popolo. But his reputation reached its apogee in 1503, when he entered the service of Pope Julius II., lately elected, whose first commission was the creation of the Belvedere, which Bramante carried out by using two orders, Doric and Ionic. He also did a great deal of work in rearranging the interior of the Vatican Palace, especially the great galleries wherein were placed, later, the most valuable specimens of Grecian sculpture.

Bramante was inventive and impetuous; he worked with feverish and indefatigable ardour, and if events had favoured him he would in a few years have made the right bank of the Tiber a truly monumental city. Unfortunately money was sometimes lacking in spite of the munificence of the popes, and he was forced to curb the ardour which consumed him.

Amongst his chief works we must not forget to include the sanctuary of St. Maria di Loreto, which was finished later by Sansovino, nor the graceful little house in the Trastevere, which belonged to his nephew, Raphael. Yet his chief claim to fame rests on the part he took in the construction of the basilica of St. Peter, a participation which has given rise to many controversies as to whether the part he played was useful or disadvantageous to the beauty of the edifice. Bramante has been accused of too warmly seconding, through personal interest, the intention of the Pope, who wished to tear down the basilica and build a new church. He prepared an infinite number of designs, each more bizarre than the last, but which all bore trace of the fertility of the imagination whence they proceeded. The fact is that a good half of the ancient structure was torn down, and that Bramante set about rebuilding with all the impatient zeal which characterised him. At the death of the Pope the building had already risen to the height of the cornice. He was the first to use vaults with wooden projecting caissons, with the stucco ornaments that encase them, which catch the eye. To him also was due the invention of the method, subsequently used by Antonio San Gallo, of building the vaults on hanging bridges.

Bramante's design was grandiose indeed and colossal, but in addition to the fact that the money at command was not enough to provide for his vast conception, death overtook him too soon and prevented his carrying to completion his gigantic undertaking. We cannot even form an opinion of the value of his plan, because it was altered by the architects who succeeded him, each of whom, for personal reason or because they felt the need of flattering the several pontiffs who ascended the throne, one after the other found it desirable to introduce changes so as finally to totally change its spirit. In the first place there followed Raphael and Giulio da San Gallo, who, after the death of Julius II., changed the design and even altered parts already newly erected. Then came Balthazar Peruzzi, who would have liked to pull down the entire building and make a fresh start, and then in the last place came Michelangelo Buonarroti, who knew how to make all details give way before his iron will, and conform themselves to his taste and manner of conceiving and understanding things. But all contemporary writers are agreed that none of these had succeeded in imagining anything as sumptuous and magnificent as that which Bramante had conceived, and that St. Peter's would have been a monument much more worthy of admiration if Bramante's ideas had been respected. Even Vasari dares to express this belief, in spite of his love for and partiality toward Michelangelo, which so often made him unjust towards others.

He died, as we have said, in 1514, at the age of seventy. He lived ostentatiously, spending with liberal hand the money that he earned. He was very fond of music, and often improvised on the lyre; nor did he scorn to practise the poet's

art, and his biographers declare that some of his sonnets were far from bad. He was a typical artist of the Renaissance, well read and well informed and epicurean, like the popes of that marvellous epoch.

This basilica of St. Peter, of which Bramante was one of the most active architects, is a monument which has passed through the strangest vicissitudes, some of which have modified and transformed its physiognomy. It occupies the site where was in ancient times the Circus of Nero, where all the martyrs were done to death. The remains of these ancient Christians have been placed in a catacomb, of which the entrance is at the foot of Monte Vaticano, and according to a tradition, which is questioned by Protestants, the remains of St. Peter himself were transported thither by St. Marcel. However this may be, about a hundred years after the death of Jesus Christ, the fourth pope after St. Peter, St. Anacleto by name, caused to be erected here a sanctuary. The foundations of the great basilica were laid as follows:—About two centuries later the Emperor Constantine, converted to Catholicism, to show himself worthy of the baptism he had just received, undertook to construct on the ruins of this sanctuary a sumptuous basilica which should be rectangular in form and divided into five naves by four rows of columns, each nave being reached through a separate door in the façade, in this particular greatly resembling the church of St. Paul extra Muros as we see it to-day. After the manner of the time, the structure was preceded by an open square court surrounded with porticoes, of which no trace remains.

In 1440 the basilica of Constantine threatened to fall in ruins and Nicholas V., about the middle of the fifteenth century, conceived the idea of building a new metropolitan church. Nicholas was that pope of enterprise and genius who first practically opened the era of the Renaissance. He loved art for itself, not for the sake of mere show and fashion like some of his predecessors.

The architects of this new structure were Rossellini and Leon Battista Alberti; but it had been raised only a few metres above the ground when Nicholas died and the work was instantly abandoned. Paul V., a man of Venetian birth, undertook a veritable crusade to raise the necessary funds, himself giving five thousand crowns, and on his appeal the faithful sent contributions to Rome for the purpose of continuing work on a structure which shortly after was to become the most noted in the Christian world. But the merit of having given decisive impulse to this grand undertaking was reserved for Julius II., a Ligurian by birth, who, by the boldness of his conceptions and the firmness with which he prosecuted them, may be properly held one of those men of true genius of whom humanity can boast. He desired above all things that St. Peter's should be finished during his reign, and he gave the preference to the design of Lazzari Bramante, who, by the breadth of his views and the ostentatious character of his project, could not fail to seduce the imagination of such a pope. Julius II. urged him to do something which should surpass in size and majesty every fine piece of work that the world contained, and Bramante did not need to be told this twice.

The most characteristic feature in Bramante's design is that the basilica was to have the form of a Greek cross with arms of equal length. He had been much impressed at Florence by Brunelleschi's dome, which is still a masterpiece of elegance and audacity, and he dreamed of repeating it at Rome on a greater scale, to be in keeping with the programme the pope had prepared for him. To this end he had built at the four corners of the transept four enormous piers to serve as supports for the dome. Unfortunately, death surprised him while in the full current of feverish execution, and Julius II. survived him only one year.

His successor, Leo X., entrusted the work to the young Raphael and Giuliano da San Gallo. Their first care was to consolidate the substructures of the four great piers, which did not seem to them to be strong enough to bear the enormous dome which Bramante intended to place on them. It was Raphael who, setting his love for an artistic ideal above the veneration he had for his uncle, changed the general plan of the building, giving it the form of a Latin cross such as it has to-day. Unfortunately, death overtook this incomparable artist, too, in his full bloom, and from 1520 to 1546 the work had to be entrusted to divers architects, who, as much through vanity as through ignorance, often made changes in the design of the monument, which thus grew without the spirit of natural development and underwent alterations the unfortunate effects of which its general style felt. At length, in 1546, the pontiff Paul III. broke through the intrigues which up to that time had kept Michel Angelo at arm's length, and placed the work in his hands. He made the design for the dome, but before it could be built he also died. It was not finished until 1573 by Jacopo della Porta, who entirely respected Michel Angelo's design. This was not the case, however, with the façade, which according to Michel Angelo's design was not so commonplace as the one we now see, with its enormous columns planted against the wall. He intended to have the columns

stand free, forming a portico like that of the Pantheon and those of the great monuments of antiquity, which are not heavy, in spite of their often enormous proportions, simply because light and air have free play over their exterior con-texture.

During the pontificate of Paul V., Maderno finished this monumental structure by completing the façade upon which, in 1612, the name of the munificent pontiff was engraved in huge letters.

Fontana published a monograph of this building, from which it appears that up to 1694 the total sum expended upon the building had been 47,000,000 Roman crowns, which represents in our money the sum of about 45,000,000 dols. There must be few buildings in the world that have cost so much, but it is fair to say that St. Peter's, by its vast size and the richness of its details, accounts for the enormous size of the pecuniary sacrifices that its construction demanded.

The aspect of the building gives no clue to its tremendous size, for every part is so well proportioned that what elsewhere would seem gigantic here appears to be merely of normal size. The circular colonnade which surrounds the piazza serves to reduce to reasonable proportions the enormous mass of the basilica framed between the two semicircular colonnades. This is the reason why, when one undertakes to measure any portions of the building, the resulting figures are far greater than was expected. For instance, the façade has a total height of 167 feet, the columns engaged in the wall are 8·5 feet in diameter and 91·6 feet high, the cornice is 8·5 feet high, the attic 33 feet, the balustrade 5·8 feet, while the statues on the balustrade measure 17 feet. The cross which crowns the structure is 460 feet above the level of the ground. The length of the building is 613 feet and its breadth at the crossing is 124·7 feet. To get an idea of the immense size of the nave it is enough to measure the baldachino which encloses the high altar at the middle of the transept. At first sight it appears to be only of common size, and yet it is really more lofty than the Farnese Palace, the summit rising 91·6 feet above the level of the floor, that is to say 22 feet higher than the pediment of the colonnade of the Louvre at Paris.

The diameter of Michel Angelo's dome is only 3·2 feet less than that of the Pantheon, which measures 141·7 feet. The wall which supports the dome is not less than 25 feet thick and the distance from the floor to the vault of the lantern is 393 feet.

The axis of the building runs almost exactly east and west. The length from the door to the tribune is 597 feet and the width at the high altar the same. Finally, the total height from the level of the piazza to the top of the cross surmounting the lantern is 452 feet.

Michel Angelo passes for the chief architect of St. Peter's, because it was he who had the luck to give the building its definitive character. Maderno injured it by adding a façade which maims the design, and conceals from the spectator in front the view of the magnificent dome as Michel Angelo intended it should be seen. San Gallo and Raphael worked up the details and carried out some of the secondary ideas contained in Bramante's plan. Balthazar Peruzzi fortunately could not carry out his own ideas, which would have turned the temple into a ridiculous monstrosity. The real architect of this cathedral was Bramante, whose anniversary was celebrated last year, and it is proper to do the justice to his memory that is its due. Even the dome which bears the name of Buonarrotti was conceived by Bramante, and the merit is really his. The fame of Michel Angelo is sufficiently great without seeking to make it greater at the expense of others.

LANDSCAPE GARDENING.*

THE soul of the landscape gardener met many a congenial one in Babylon of old, and if he was of a social nature, his genius was enlivened while wine gave rise to many toasts in the banquetting halls upon the Hanging Gardens there. In that early time (genius and prophecy being the same as now) he must have looked upon the future world as an enviable place for his calling, seeing, as he must have seen, his art become not only perfect, but world-wide in its scope. If it has yet come to perfection is perhaps a question, but its world-wide application is as far off, maybe, as it was some thousands of years ago. Between now and that Assyrian time, however, when Cyrus and other sovereigns of the Orient ordered that their palaces and residences be set amid gardens, the years have not been passing over barrenness alone, for beautiful and many have been the spots at which they might have lingered upon the lap of Flora. Palaces in Greece and Italy gave to their occupants vistas of the sea and horizon across landscapes adorned with trees and shrubbery, decked with flowers and

* A paper by Thomas Hawkes, read at a meeting of the Illinois Chapter of the American Institute of Architects at Chicago, April 16, 1894.

plants, and arranged with that artistic skill which knew so well where and how to place appropriately belvideres and statuary. Within how many gardens did Ulysses in his wanderings set his foot? And perhaps the charms of Calypso's isle detained him there as much as the charms of herself. Was not that a garden in which his men wished so much to linger, that Lotus Land where it seemed to be always afternoon? The many references of ancient writers to gardens and landscapes actually existing show that the art was long ago well understood, and as if to show their admiration for the beauties of nature in an artistic setting, their legends refer to mythical places, as the Gardens of the Hesperides and the like.

But we must not linger too long upon these bygone ages, but take a step to more modern times and see in that rough age of Charlemagne that the emperor commanded and showed how gardens were to be laid out and planted. His people, who were warrior bred, confessed by their obeying him that the soul of man loves the beautiful, from which we may premise that were it not that landscape gardening is so little understood, and hence so little brought to mind, it would be an inseparable part of architecture; and why should not this strain of reasoning induce the thought and urge the conviction that the landscape gardener should be an architect?—that as architecture is properly distinguished from mere building by the presence of the decorative or artistic element, so landscape gardening, being similarly distinguished from mere gardening, shows the ambidextrous skill of him who, while with one hand he erects an edifice, with the other he brings the surroundings into harmony with it. Truly the day-dreamer, that person who has only ideas without the means to execute them, has generally better taste than many of those whose means are ample, for it is to be supposed that no castle in Spain was ever airily built without the surrounding landscape being made a garden of.

The arch enemy of landscape gardening is utility, that utility which signifies greed or a pecuniary profit; but those even who are swayed by it lose not the love of nature or the beautiful, even as they grow older and become more and more immersed in business, for these same persons decorate their houses to the extent of their means, take pleasure looking at the landscapes of their pictures, enjoy the scenic descriptions of the writer, and seek in summer in the country the most beautiful natural scenery that is accessible. The question, gentlemen, to you is not so much to show how landscape gardening should be done as to show how a desire may be awakened to bring it to our doors; to show how this utility may be done away with, this Gorgon that in cities turns the innate desire for natural beauty into stone, and which extends its petrifying influence into country homes. But how is to be shown the way by which this utilitarian enemy of the beautiful in nature may be led off? I know of no better method for a beginning than that of making of all architects landscape gardeners. If they were such, the future manner of building would be properly changed in respect to position and exterior form, and some of the roses, flowers and vines upon the decoration of the interior would find a place upon the lawns. The architect of this double skill, for his very love of nature and consequent artistic feeling, would prevail upon the intending builder to so plan that the grounds would receive as much attention as the house. That this would result we may fairly infer if, allowing the imagination a little play, and deeming that architecture and landscape gardening were allied, or were in unison, we consider the magnificence of the gardens of Lucullus as a result, and a very probable one, of the prevalence of the art of landscape gardening in the architectural profession of those days. And this, I think, is more than a supposition, because there were many more gardens than those of Lucullus, and many besides him indulged themselves in an art whose earliest practice was with the Persians, who, according to Sir John Malcolm, had gardens at the time of Mahabad, their first king. That the Romans, contributing to or learning from Lucullus, Adrian and others, surrounded themselves with the charming beauties of vegetation, even if the variety of flowers and plants was limited, according to Pliny, to 1,000, is proven by the country seat of the elder Scipio at Laternum, the crowding of the shores of the bay of Naples with villas, and the applauding by Sylla of the masterly skill of his rival Marius, who had placed his villa on the promontory of Misenum, which on every side commanded sea and land. Passing from that time, the art of landscape gardening seems to have been nearly lost with the fall of the Roman empire, but the splendour of imperial and private gardens, though dimmed, and maybe not so fragrant, was preserved by those monks who so well, too, preserved from oblivion the writings of Greece and Rome. Believing that a thing of beauty is a joy for ever, in more than an ideal sense, these monks perpetuated the art of landscape gardening in the careful selection of sites for monasteries and abbeys. All Italy then wooed with fragrance and beauty, revived an art the effect of which has been felt ever since, and which is strongly shown in the French style, a modification merely of the Italian, and later on the Dutch, although fantastic in many essentials, with

their level grounds, their formal terraces, their canals and straight tree planting, helped to form the natural style of the present day. But let us show now how far has been the realisation of our Babylonian brother's prophecy.

In Europe there is evidence everywhere of an inclination to the art, and in many places the evidence of masterly skill is pronounced, but principally in England has the practice of landscape gardening received the greatest attention. Wealth there, by reason of its concentration to a few, has been expended in vast sums on such work, which, embodying the merits of previous successive changes, and eliminating false styles, has through the efforts of various professors made landscape gardening to be more understandingly practised than at any time in the past.

This art of landscape gardening, which should be encouraged by the wealthy and studied and practised by the architectural profession, is of the utmost aid in obtaining noble architectural effects, and is, whether ranked so or not, above all the arts for its capacity in being able in proper harmony and design to enhance to the eye the appearance and value of a building. It is greatly educational, and consequently more beneficial than the results of the skill and genius of the artist, because, while they are appreciated only by the profession, the work of the landscape gardener is a living picture made of nature's own materials, adorned with its ever-varying beauties of hues and tints as unlimited as the variety and diversity of tree forms, shrubs, ferns and grasses, and it is susceptible to the comprehension of all and so is an art pre-eminently that refines the mind and gratifies that innate longing which most of us have for the beautiful.

"When ages do grow to civility and elegance," wrote Francis Bacon, "men come to build stately sooner than to garden finely, as if gardening were the greater perfection." How noticeable this is when, considering how the art of building has advanced, and particularly so of late in this country, we observe, and to me how lamentably, the landscape gardener's art has failed to keep pace with it. Not to be didactic, which I should consider an impertinence to my audience, who certainly must admire and more or less understand the art so dear to me, I must refer again to its relation to architecture. To understand that relation much thought is required and much experience, and as much taste to its proper achievement as either thought or experience. But some will say to this that everyone is not gifted with taste and will ask if that taste can be acquired. Although it may be taken for granted that one without taste should not be an architect, I think that taste will come with practice, for taste, if to some it be natural, is but another name for skill and can in consequence be gained with labour. As I have before expressed that the landscape gardener should be an architect, I must assert now that no landscape can be properly taken advantage of or modified, that no landscape gardening can be rightly done without a knowledge of architecture, for how can one make a landscape harmonise with the buildings and *vice versa* if he lack the knowledge of architecture? Landscape gardening also requires no slight acquaintance with engineering, because a practical knowledge of the use of materials will be required, as also that of levelling, depressing or raising the grounds; but an engineer alone or an architect who is only such will treat landscape gardening from no other view than that of the profession, and one who is a gardener merely, no matter how skilful he may be in the cultivation of plants and flowers, will have the aim only to display them, and it will follow that congruity and simplicity in all these cases will give way to novelty and picturesque effects, which are two qualities only of landscape gardening.

Intricacy is to be studied in the laying-out of the grounds, and it must have the quality of variety. Simplicity must contrast with grandeur, novelty must give it animation, association must endear it, and all must be bound in continuity. These effects can be best achieved if the landscape requirements be studied before the planning of the building is definitely made, but they can very seldom be attained, and if so in a modified form only, if the structure is erected and the grounds considered afterward. But here I must acknowledge the too apparent truth that architects are not generally landscape gardeners, but this fact should not prevent those who can often mould their clients to their will from pointing out to them the advantages to be gained by employing a competent landscape-gardener to select the site of their building when this is possible. How infinitely superior the results would be, and to how much better advantage would the buildings show, and how much would be gained in the comfort and convenience of the owner? There would be no poor perspective from the approach, where first impressions are gained, to give an unfavourable impression of the edifice that by itself might be perfect, while a proper consideration of the perspective will often make appear nearly correct a building that is the reverse. Of course in all this there is more to be studied than the immediately contiguous scenery: the characteristics of the ground and the neighbouring scenery must be taken into

consideration; the character of the soil, and, too, to arrange the relative positions of the different buildings. Drainage, also, must be taken into account. Collaterally to landscape gardening the finest views for the different rooms are to be studied, and by so doing avoid the frequent case of presenting the worst views from the best rooms of the house, and *vice versa*. A little thought in this matter will so arrange that natural or artificial beauties shall be seen from other rooms than those which are reserved for very indifferent purposes. Shelter from the wind is also an important matter and should be carefully taken into account, for, why, except to obtain a conspicuous position, should a house be built upon a treeless hill unsheltered from the wind and sun? When this is done everything is sacrificed to conspicuousness, and upon closer views the structure presents as forlorn an appearance as the eminence does a barren one. In these instances there are generally utilitarian attempts resulting in unnatural treatment of the grounds, and presenting a picture of hideousness that no after-architectural efforts can efface; but allowing that these conditions can be ameliorated, no laboured art, no amount of skill can compensate for lack of judgment or good sense in the original planning.

It may be asked with the multiplicity of architects, and with the number of them who have an abundance of time on their hands, how these conditions come about. Curious as it may appear, people who would not think of erecting a building without the aid of an architect will select the site and lay out the grounds without a thought of their qualifications for such work; and rarely will you find one frank enough to admit that he requires assistance in such matters, but should he entrust them to another, he will very probably say that he does not do the work himself because he has not the time. It is not to be expected that every one who builds will consult the landscape gardener, or even take into consideration the landscape at all. But I do not speak of those who have not the means to beautify or appropriately treat their dwellings or buildings, for landscape gardening means in every case a proportionately generous expenditure of money, which is made necessary by the fact that it takes time to make any grounds beautiful, and much time is required in many cases, in such as require that designs for the future must be made, for present effects are not always lasting, and often to produce future ones those of the present must be sacrificed. As much as I have in the beginning of my address be-rated that very useful quality, utility, it must be considered in the long run. Under the head of utility may be mentioned that were the landscape gardener consulted in the first place the money paid for his services would be no small part of the saving effected, for, taking advantage of the conformation of the grounds, he avoids expensive so-called improvements.

What is the occasion of the rectangularity of our towns, so rectangular that a curve would seem to be an offence? Surveyors lay out our towns and villages in checker-board fashion. Streets are projected in impossible places, building lots are often inaccessible and drainage is bad, making necessary an ant-like process or excessive expense to cut down the natural hills. These evils seem never to be at first noticed, or if they are they are not considered, because shortsightedness, under the name of utility, wishing to make the greatest number of lots, does not see that were the natural advantages of the ground considered our towns would be better in all respects instead of being ugly for all time. There is a possibility though that these matters may be more generally observed, and that the future holds out some hope, for fast as we have developed it the whole country is not yet quite subdivided.

THE PANAMA AND NICARAGUA CANALS.

THE Paris *Nouveau Monde* has an article on the subject of the present situation and respective advantages of the Panama and Nicaragua Canals.

The concession of the Nicaragua Canal was made by the Government of that State in 1887—that is to say, at the time when the embarrassed condition of the Panama Canal Company commenced to be known, but it was only at the commencement of 1889 that a company with a nominal capital of 100,000,000 dols. was founded by the canal executive under the title of the Maritime Canal Company of Nicaragua. This company immediately confided the works to another company, established at the same time as it, with a nominal capital of 12,000,000 dols., under the name of the Nicaragua Canal Construction Company. In September 1893 the Maritime Canal Company of Nicaragua suspended payment and was made bankrupt. In January 1894 an attempt at reorganisation was made, and at this period the state of the works was as follows:—

Three kilomètres excavated at 5 mètres depth; 330 mètres of dyke constructed on the Atlantic at Greytown, 17 kilomètres of railway, 92 kilomètres of telegraph line. Finally, the land has been cleared of timber on 32 kilomètres only.

The works, machines and interest paid represented at that date 7,300,000 dols., or about 1,440,000*l*. It does not appear as if the works had been continued since that time. In 1894 all the assets of the old company had been purchased for 2,970,000 dols. by a committee of reorganisation, which sought vainly to procure capital in France and England. This committee, since the foundation of the new Panama Company, has formed a company with a nominal capital of 12,000,000 dols.; that is to say, about equal to that of the new Panama Company. The promoters of this company have asked for a guarantee of interest from the Government of the United States, which guarantee has already been refused by the American Senate on two different occasions to the old company. The American Senate has just voted a law granting the financial aid of the United States for the construction of the canal, but before the final settlement this law has still to be approved by Congress.

The making of the Nicaragua Canal has elicited many very divergent expressions of opinion, and it has even been asserted that the canal was absolutely impossible, owing to the frequent earthquakes in the region. The strongest arguments which have been brought against the Nicaragua enterprise appear to be the following:—1. The Nicaragua Canal can only be a sluice canal. The Panama Canal, on the other hand, will be able gradually to become a level canal, and will be better adapted to a larger traffic. 2. The constructors of the Nicaragua Canal will be obliged to build a railway along the whole length, while the Panama isthmus enjoys the advantage of being already served by the Panama Railroad, the co-operation of which with the new company is assured. 3. The Nicaragua works are only commenced, and represent an expenditure of scarcely 1,400,000*l*., whilst those of the Panama Canal represent, at the lowest estimate, an expenditure of from 16,000,000*l*. to 20,000,000*l*. Finally, the new Panama Company, which has already made a large advance, has the period up to October 31, 1904, in which to finish the canal. As regards the terms of the Nicaraguan concession, the canal must be opened to navigation on November 10, 1900.

THE ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.

THE Royal Society of Antiquaries of Ireland have arranged a tempting and extensive programme of meetings and excursions for the present year. During the week commencing May 6 meetings and excursions will be held at Kilkenny and Waterford, the Society visiting the latter place at the invitation of the Waterford and South-East of Ireland Archæological Association.

The principal meeting of the year will be held at Galway for the province of Connaught on Monday, July 8, and a series of elaborate excursions has been arranged in connection with this meeting, a principal feature of which will be the sea trip from Belfast to Galway. The steamship *Caloric*, one of the finest of the passenger steamers built in Belfast, has been chartered for the trip, which will occupy a week. The cabin contains first-class accommodation for one hundred passengers, half of whom will be provided with state rooms, and the table will be equal to that of the best hotel and at a very moderate inclusive rate. Before leaving Belfast an opportunity will be given to members to examine an extensive collection of Irish antiquities collected there, which will be on view in connection with the Industrial Exhibition.

The party will leave Belfast on Tuesday morning, July 2, and, passing Rathlin Island, off the Antrim coast, will visit Tory Island, off the coast of Donegal, with its round tower, and many Pagan and Christian antiquities. The noted Inismurray, off the Sligo coast, will next be visited, and the numerous interesting remains, so fully described and illustrated by Mr. W. F. Wakeman, will be examined with interest.

Iniskea and Inislora, off the Mayo coast, will meet with a full share of attention, and Clare Island and some of the other islands in Clew Bay will, if time and weather permit, be investigated. The steamer will anchor in Killery Bay, and an opportunity will be given of seeing this charming fiord. High Island, off the Galway coast, and St. MacDara's Island, will be visited, if time permits.

The Islands of Aran will be reached on Friday morning, July 5, and here the Belfast contingent will be joined by the members from Dublin and elsewhere, who may have been unable to undertake the trip from Belfast. The combined parties will land at Kilmurvey, a small bay on the east side of the North Island, and here the primitive church of Teampull Mic Duach will be examined. The ascent to Dun Aengus will then be made. This fort stands on the brow of an overhanging precipice, 302 feet above the level of the Atlantic, which surges at its caverned base. The walls are built in a horseshoe form on the summit; there are three enclosures or semicircles, the innermost wall being much the thickest; outside the second wall is a *chevaux de frise* of erect slender stones, averaging

about 3 feet high, which even yet present a formidable obstacle. The innermost enclosure or keep measures 150 feet from north to south, and 140 feet along the edge of the cliff; the enclosing walls, like those of the other forts in the islands, are composed of three distinct coatings or skin, and now measure about 12 feet 9 inches in thickness, and are still about 20 feet in height.

The other forts in this neighbourhood are Dun Onaght, Dun Eocha and, nearer Kilronan, Dubh Cathair, or the Black Fort, all of which present peculiarities of construction and many interesting details of entrances, chambers, stairs, banquettes in good preservation.

The group of ecclesiastical ruins near the north-western end of the island, called Teampull Breacain, or the Seven Churches, will next be visited. There are several inscribed stones here, one bearing the inscription "VII. Romani"—the Seven Romans—and another is in the Irish language. Around the principal church, which consists of a chancel and choir with semicircular choir arch, are the remains of monastic dwellings and a finely sculptured terminal cross.

On the road to Kilronan, which will be traversed on foot, the church of "the Four Beautiful Saints" will be examined and the four graves will be seen where these saints have been interred. Cloghauns, or stone-roofed houses and pillar-stones, occur here, and several groups of primitive churches will be met with on the way.

Oghill Fort, near the lighthouse, will also be taken. Teampull Soorney, and the church and crosses of St. Kieron, or the great Connaught Monastery, called Mainister Connaughtagh, and Killeany Round Tower will be visited, and from it the ascent to Teampull Benain will be made; this is considered the gem of early Irish churches, being only 10 feet 10 inches long in the clear and 6 feet 10 inches broad, and in its vicinity are the remains of a rude chancel containing chambers.

On Saturday, July 6, Inish Mann, or the Middle Island, and Dun Conchobhair, one of the most remarkable of the Aran forts, and which remains almost entire, will be visited. It is oval, standing on the edge of a steep cliff in the centre of the island, and is 227 feet long by 115 broad; the walls are 20 feet high and 18 feet thick at base. In the vicinity there are the ruins of several churches, saints' beds and holy wells, &c., which will be visited in detail. Kilcannanagh, a most complete and interesting cell of the sixth century, will be seen on the return journey. The saint's grave and his holy well adjoin the ruin. Two other churches, one dedicated to the Blessed Virgin and the other called "Teampull Seacht Mic Righ," or the church of the Seven Sons of the King, will finish the objects to be seen on the Middle Island.

The afternoon will be devoted to "Inis Oirir," now Innisheer or the south island. There is a huge dun in the centre of the island, inside of which is the Mediaeval castle of the Cluan Tiege O'Brien, a square tower, 43 feet by 26 feet at the base and 30 feet high. The principal antiquity on this island is the church of St. Kevin, consisting of a nave of the time of the saint, and choir with beautiful choir arch, probably of the twelfth century; the saint's bed is here also still reverently regarded.

This church, like one on Omev Island, and the church of Perranzabuloe in Cornwall, is liable during the presence of strong winds to be buried in the shifting sands which surround it. Fortunately, the wind from the contrary quarter empties it again, and the Board of Works, in whose charge it now is, have been lately devising some means to keep out the sand.

Another interesting church in this island is the seventh-century chapel of St. Gobnet, measuring 13 feet by 9 feet, with square-headed doorway and semicircular-headed east window.

When the ethnographical section of the British Association visited Aran in 1857, they were unable to take in the south island, which contains a great number of interesting remains very imperfectly known. The group of ruins known as "The Burial-place of the Seven" lies westward of the island, and is difficult of access. The name of the church or burial-place is not recorded.

On Sunday the "Claddagh," a primitive community, which until recently had its "king," will be seen, and for those who do not object to a drive on that day the Abbey of Clare-Galway will be visited in the afternoon.

On Monday, July 8, a trip will be made across Galway Bay to Ballyvaughan, from which vehicles will be taken to the Cistercian Abbey of Corcomroe, in county Clare, and the primitive church of Oughtamama will also be seen. A meeting will be held in the evening at the Railway Hotel, Galway.

On Tuesday the ancient town of Athenry, "the ford of the kings," with its ancient gateways, and the ruins of the Augustinian and Franciscan friaries and the castle, will occupy the morning, and in the afternoon the Cistercian House of Abbey Knockmoy will be visited. The members will proceed to Athlone in the evening.

The O'Connor Don, P.C., vice-president of the Society, has invited the members to visit Roscommon and Ballintubber, and the train will be taken at Athlone by the limited mail at ten o'clock A.M. for Roscommon on Wednesday, July 10, where

the castle and abbey will be visited, leaving Roscommon at one o'clock and arriving at Ballymoe at 1.40 P.M., which is distant from Ballintubber Castle about two miles. This castle was the seat of the O'Conors of Connaught for many centuries, and was the largest fortified residence in Ireland. The train will leave Ballymoe at 4.50 P.M. for Dublin and Athlone.

An excursion to the Loughcrew Hills, co. Meath, is arranged for Monday, August 5, and the Wexford meeting and excursions in that county will come off in the week commencing September 9 next.

LOW-LYING HOUSES IN LONDON.

THE following regulations have been made by the London County Council under section 123 of the London Building Act, 1894 (57 and 58 Vict. cap. ccciii.), with the concurrence of the Tribunal of Appeal, prescribing the course to be followed by applicants for permission to erect or adapt dwelling-houses on low-lying land.

Every person who shall be desirous of erecting or adapting any building to be used wholly or in part as a dwelling-house on any land in the county of London of which the surface is below the level of Trinity high-water mark, and which is so situate as not to admit of being drained by gravitation into an existing sewer of the Council, shall first make a written application for a license. Such application shall be addressed to the clerk of the Council.

Such application shall contain a statement as to the nature and extent of the interest of the applicant in the building or buildings proposed to be erected or adapted, and be accompanied by a plan and section of the lowest floor of such building or buildings and the curtilages thereof to a scale of $\frac{1}{2}$ of an inch to a foot, and by a block plan to a scale of not less than $\frac{2}{2500}$ (which may be on a sheet or sheets of the Ordnance Survey, or may be drawn on tracing linen), showing the position of such building or buildings and the local sewer into which it is proposed to drain such building or buildings, and the connection of such local sewer with an existing sewer of the Council.

Such plans and sections shall be accompanied by a description of the materials to be used in the construction of such building or buildings, and shall be coloured in accordance therewith. The points of the compass shall be marked on the block plan.

The position and course of the drainage system proposed to be adopted for the disposal of sewage and rain-water, and its connection with the local sewer or an existing sewer of the Council, shall be clearly shown on the plans and sections, and the diameter and inclination of the drain-pipes shall be figured thereon.

The plan and section shall also indicate in figures the level above or below ordnance datum at which it is proposed to construct the floor of the lowest rooms.

The decision given by the chief engineer of the Council upon such application shall be reported to the Building Act Committee, and the committee shall report it to the Council, and thereupon, if it is to the effect that the erection or adaptation may not be permitted, the clerk of the Council shall by letter inform the applicant that the Council, acting upon the decision of the engineer, has refused permission. If it is to the effect that the erection or adaptation may be permitted, a license under the seal of the Council embodying the conditions of the engineer's decision shall be issued to the applicant.

The following regulation has been made by the Council under section 122 of the London Building Act, 1894, with respect to the erection or adaptation of dwelling-houses on low-lying land:—

It shall not be lawful to place the underside of the lowest floor of any permitted building at such a level as will render it liable to flooding, and every permitted building shall be efficiently and properly drained to the satisfaction of the engineer for the time being of the Council, either into a local sewer or into a main sewer of the Council.

PROFESSIONAL ETHICS.

THE Boston Society of Architects have issued the following code of professional ethics, of which the use should not be confined to America:—

1. No member should enter into partnership, in any form or degree with any builder, contractor or manufacturer.
2. A member having any ownership in any building material, device or invention proposed to be used on work for which he is architect should inform his employer of the fact of such ownership.
3. No member should be a party to a building contract except as owner.
4. No member should guarantee an estimate or contract by personal bond.

5. It is unprofessional to offer drawings or other services on approval and without adequate pecuniary compensation.

6. It is unprofessional to advertise in any other way than by a notice giving name, address, profession and office hours, and special branch (if such) of practice.

7. It is unprofessional to make alterations of a building designed by another architect, within ten years of its completion, without ascertaining that the owner refuses to employ the original designer, or, in event of the property having changed hands, without due notice to the said designer.

8. It is unprofessional to attempt to supplant an architect after definite steps have been taken toward his employment.

9. It is unprofessional for a member to criticise in the public prints the professional conduct or work of another architect except over his own name or under the authority of a professional journal.

10. It is unprofessional to furnish designs in competition for private work or for public work, unless for proper compensation, and unless a competent professional adviser is employed to draw up the "conditions" and assist in the award.

11. No member should submit drawings except as an original contributor in any duly instituted competition, or to secure any work for which such a competition remains undecided.

12. The A.I.A. "schedule of charges" represents minimum rates for full, faithful and competent service. It is the duty of every architect to charge higher rates whenever the demand for his services will justify the increase, rather than to accept work to which he cannot give proper personal attention.

13. No member shall compete in amount of commission or offer to work for less than another, in order to secure the work.

14. It is unprofessional to enter into competition with or to consult with an architect who has been dishonourably expelled from the "institute" or "society."

15. The assumption of the title of "architect" should be held to mean that the bearer has the professional knowledge and natural ability needed for the proper invention, illustration and supervision of all building operations which he may undertake.

16. A member should so conduct his practice as to forward the cause of professional education and render all possible help to juniors, draughtsmen and students.

THE INTERNATIONAL RAILWAY CONGRESS.

THE International Railway Congress and Exhibition, to be held at the Imperial Institute from June 26 to July 9, is the first meeting of its kind in this country, and it promises to possess great interest for the railway world and not a little for the general public. Out of 20,000 odd miles of railway open in Great Britain, over 19,000 will be represented at the congress. Representation is based on the mileage worked—the larger the mileage the more numerous the representation. The initial contributions on any subject will not convey merely the opinion or experience of one man, but will take the form of reports by experts, who, having first submitted questions to railway authorities, subsequently analysed the facts thus gleaned. Mr. Frederick Harrison, general manager of the London and North-Western Railway Company, will report on the organisation of the central administration and outdoor staff, and the various systems of different countries. Mr. A. M. Thompson, M.I.C.E., signal engineer of the London and North-Western Company, will deal with the whole question of signals, introducing recent improvements in block and interlocking apparatus. The subject assigned to M. Sabourat, chief engineer of the central division of the Orleans Company, is "On places in permanent way requiring special attention to avoid the necessity of expresses slackening speed, and to prevent shocks in passing special points, such as sharp curves, long and steep gradients, facing points, road crossings, swing bridges, &c." Rolling stock for express trains will be spoken to by Mr. C. A. Park, carriage superintendent of the London and North-Western Railway. Special reference will be made to the type of rolling stock for express trains and long journeys, vestibule trains, improvements in internal arrangements and various modes of heating and lighting. Mr. William Hunt, chief engineer of the Lancashire and Yorkshire Railway, will deal with the question of the strengthening of permanent way in view of increased speed of trains. Mr. Henry Lambert, general manager of the Great Western Railway, has for subject the acceleration of the transport of merchandise, the influence of speed on the expenses of haulage, and the utilisation of railway stock on the one hand and the number of vehicles on the other. Mr. George H. Turner, general manager of the Midland Railway, will report on the arrangements as to shunting and handling of merchandise, &c., and mechanical and electrical plant in shunting and marshalling. M. A. Zanotta will deal with railway junctions and the best method of constructing these on express lines so as absolutely to avoid slackening speed, and the best

arrangement of points and crossings. The home railway companies are doing all in their power to make the congress useful to visitors from a distance, who will have the opportunity of inspecting the more important railway works throughout England and Scotland.

OXFORD COUNTY LUNATIC ASYLUM.

ON Monday morning, the 15th inst., a fire was discovered in the women's dormitory at the Oxford County Asylum at Littlemore, near Oxford. The outbreak took place in the south wing, which was occupied as the women's quarters, and was discovered by one of the nurses. Arrangements were instantly made for the conveyance of the patients, who numbered upwards of 300, to a place of safety, a task which was accomplished without injury or disturbance. Although the alarm was promptly conveyed to Oxford, considerable delay occurred before the engine could start, owing to the difficulty experienced in procuring horses; but by a fortunate coincidence the Blenheim fire brigade were engaged in a competition at Sandford, a village about a mile from the scene of the fire, and the call being conveyed to them they immediately repaired to the spot and rendered efficient service. It was evident, however, that the south wing of the asylum could not be saved, and the efforts of the workers were therefore confined to saving the adjoining buildings, a task in which they were successful. It is stated that the fire originated in the overheating of a flue in the upper portion of the building, and the damage is estimated at several thousand pounds. Two of the Blenheim firemen received slight injuries through falling from the second storey owing to the breaking of a ladder. One of the Oxford firemen was also disabled owing to some molten lead running off his helmet down his ear and neck.

HAVRE HARBOUR.

THE French Government publish a law giving power to the department of the Seine Inférieure, and to the Chamber of Commerce of Rouen and Havre, to raise 21,250,000 francs (850,000*l.*) towards making up a total of 42,500,000 francs (1,700,000*l.*) required for improvements to the ports of Havre and Honfleur and the course of the Seine between Rouen and Havre. The improvements proposed to be carried out by this Act are:—(1) The dredging of the south-west entrance of the port of Havre to a depth of 3 metres below zero of the charts; (2) new defences at the point of La Hove; (3) the formation of a new harbour outside the present port of Havre; (4) the opening of a dock entrance communicating directly with the basins Eure and Bellot; (5) the dredging of shoals in the Seine by Quilleboeuf; (6) the completion of dykes between Quilleboeuf and La Rizle, and their extension to Honfleur. Havre and the department of the Seine Inférieure advance 13,750,000 francs, Rouen 7,500,000 francs, of the total of 42,000,000 francs required for the works. The rest is to be a charge on the national exchequer. To meet this interest and redemption of the capital during 45 years, new tonnage and passenger dues to be substituted for those at present levied are authorised at Rouen and Havre.

GENERAL.

Mr. H. P. Burke Downing, we are pleased to find, has been appointed architect for a new school at Singlegate, Merton, for the Mitcham School Board.

A Design by Messrs. W. & J. B. Bailey, of Bradford and Keighley, has been adopted for the new Board schools in Tong.

M. Josso, architect, has been awarded the Prix Duc by the Académie des Beaux-Arts for the Musée at Nantes which was completed a few years ago.

The Tollhouse Trustees seek for aid towards the cost of securing and preserving the remains of the Grey Friars Cloisters, Great Yarmouth, and any other parts of the monastic buildings which may be offered for sale.

The London Geological Field Class will commence their series of Saturday afternoon excursions, under the direction of Professor H. G. Seeley, F.R.S., on the 27th inst., when they will visit Olford and Eynesford. Further particulars can be obtained from the general secretary, Mr. R. Herbert Bentley, 31 Adolphus Road, Brownwood Park, N.

A Wealthy Greek, of Alexandria, has offered half a million drachmas for the restoration of the ancient stadium or race-course, so that it may be used for the Olympic games to be held at Athens next year.

A Silk Exhibition has just been opened at the School of Art, Macclesfield.

Dewsbury Parish Church has been reopened after undergoing renovation and partial rebuilding, from the designs of Mr. Street.

The Architect.

THE WEEK.

THE loan collection of pictures which is on view in the Guildhall Art Gallery does not contain one example that is without interest. It is to be regretted, however, that the gallery is not worthy of its contents. The lighting is very defective, and in consequence of the peculiar shadows the young bride in the *School Revisited* sometimes appears to have grown more aged than was intended. Mr. SOLOMON has been so often made to suffer by the lighting in the Academy, he may be used to injustice, and will not murmur at the position assigned to his *Samson*. There are many works which, although lately exhibited, are not forgotten, such as Mr. CLAUSEN'S *Ploughing*, Mr. WATT'S *Fata Morgana*, Mr. LOGSDAIL'S *Gate of the Khalif, Cairo*, Mr. J. W. WATERHOUSE'S *Circe*, Mr. PRINSEP'S *Golden Gate*, Mr. PHIL MORRIS'S *Première Communion*. There are a few older works. The late H. O'NEIL'S *Eastward Ho!* was when first seen as popular as the *Roll Call* of a later time, and although the colouring looks strange beside modern works, there is a touch of nature about the picture which still appeals to the public. It is likely to be the most popular picture in the Gallery. Mr. FRITH'S *Claude Duval* set the fashion for Newgate heroes in English art, and on that account many will prize it. In the upper gallery pre-Raphaelitism and allied principles are represented. Mr. DANTE ROSSETTI'S *Prosperine* and other works will have special admirers. The *Scapegoat*, by Mr. HOLMAN HUNT, has a realism which no engraving of the work has expressed. For suggesting desolation it would not be easy to match it. But among the examples of the school Mrs. W. M. ROSSETTI'S *Romeo and Juliet in the Vault* is not surpassed for grace and tenderness. The *Turkish School*, by J. F. LEWIS, rivals any pre-Raphaelite example in its detail. But the picture in the room which is most delightful is the *Moorish Garden*, by Sir F. LEIGHTON. It represents a girl near cypresses and roses, and followed by a pair of peacocks. It may want the sculptural and decorative manner of the artist's later works, but it has a depth of colour and repose which they do not afford. *Sindbad in the Valley of Diamonds*, by Mr. A. GOODWIN, presents some of those startling effects which he loves, and he was never more successful. Mr. LAVERY'S *Ariadne* is vigorously painted, without coarseness or affectation of impressionism. Mr. ALMA-TADEMA'S *Pyrrhic Dance* and Mr. POYNTER'S *Catapult* suggest two modes of treating classic themes. PHILLIP'S *La Gloria* is rather commonplace as a subject, and the contrast between life and death is too emphatic. Lastly, we may mention *The Death of Chatterton*, a picture which was one of the wonders of 1856. Another room is devoted to several excellent examples of the Dutch school.

THE results of the examination of the air in some of the Board schools in Manchester and Salford were laid before the Sanitary Conference in Manchester on Wednesday by Dr. G. H. BAILEY. The observations were made in the summer months; the weather was such that the windows could be kept open the whole of the school time. Dr. BAILEY found even in the large rooms at Webster Street and Grecian Street Schools, which were the most favourably circumstanced, there was a distinct odour, whilst in the classrooms the air was very oppressive, giving rise to headache when it had to be endured for a period of half an hour together. At Lloyd Street, St. Stephen's and Granby Row matters were still worse; the excess of carbonic acid gas was as a rule 12 to 15 in 10,000, and the odour, in the classrooms especially, almost unbearable. On dull, moist days the temperature within and without was practically identical, and hence there was a very limited circulation; the air was then worse than on fine, clear days. On such days the odour was very pronounced. It was clear that even under favourable conditions the fresh air supply was too limited. Dr. BAILEY expects to be able to undertake similar observations during the winter. It would be well if he could also discover where fresh air is to be obtained, for when the outside air is as malodorous as the

air in the classrooms, without a purifying process it is not easy to see how an improvement can be insured.

AN allied subject that was treated at the same conference was the lighting of schools. Dr. E. JONES said he came to the conclusion that not even 5 per cent. of schools of all classes in Manchester and Salford would stand a moderate test of efficiency in lighting. Many of them seemed to have been built without the slightest regard to the use to be made of them by young and growing children. Not only short sight and weak sight, but also spinal curvature could be ascribed to defective lighting. The investigations of Dr. COHN, of Breslau, Professor PFLÜGER and other authorities who had investigated the subject were adduced to show the evils arising from the neglect of proper precautions as to the lighting of schools. Dr. JONES said that instances could be indefinitely multiplied of the grossest violation of the simplest rudiments of hygienic laws, and yet children were forced to attend under such conditions. It was surely time that an intelligent democracy should see the absolute futility of making the election of those responsible for school management a question of politics, or of whether a candidate was for church or chapel. What was wanted was to find intelligent men who appreciated and understood the laws of health, and who, at all costs, would see the laws were applied. There should be plenty of light, which should come from the left side. All the authorities were agreed that the best aspect for windows was east or west. He also urged the adoption of the electric light in schools. Dr. JONES appears to be assured that the cause of the evil is the lighting, but he would, we are sure, admit that all physicians who have investigated the subject are less certain about the conclusions.

COVERED markets are to be erected in Leek, and designs have been submitted in competition. Messrs. SUGDEN & SON, Leek, and Messrs. MOSLEY & ANDERSON, Northampton, early in the week addressed the members of the District Council, saying:—"We feel sure we speak for all the competitors, as well as for ourselves, in respectfully urging upon you the propriety of calling in expert advice to assess the merits of the various designs, a course now universally adopted in competitions which are intended to be placed above blame or suspicion. From your final instruction we submit competitors had the right to anticipate your eventually taking this course." At the meeting of the District Council on Tuesday the subject was considered, and the appointment of an assessor was proposed. Six members voted for the motion and seven against it, while four declined to vote. The motion was therefore lost.

THE wondrous little paintings by HANS MEMLING in the Bruges Hospital are comparable with any of FRA ANGELICO'S. It is a pity, however, that the keeper of the Art Library at South Kensington demolished the legend about HANS being a broken-down soldier, who in gratitude for his treatment in the hospital painted the pictures. Since Mr. WEALE established that the artist owned his own house in Bruges and was able to lend money to the Corporation, we are afraid fewer people care to see the shrine and the pictures which brought so much aid to the hospital in past years. Probably HANS MEMLING would have preferred that his works were judged by their merits, and not because he was imagined to be a hero of a romance. If the portrait in the Brussels Musée resembled him, there could not be a more unsoldierly man. Except the portrait, which was not his work, there is nothing to recall HANS MEMLING in that collection. It is no wonder therefore so much eagerness should be evinced about securing a triptych which is attributed to the painter, and is now possessed by a dealer in Paris. The price is 240,000 francs, and one-sixth of the sum has been subscribed by the wife of the Belgian Prime Minister. The triptych is on a larger scale than the majority of MEMLING'S works. On the central panel CHRIST is represented in a priest's vestments, while on the sides angels are seen in adoration. The triptych was obtained from a Spanish monastery, in which it appears to have escaped the notice of travellers.

RAPHAEL MENGES.

THERE are some artists who seem destined to be victims of prejudice even when they have passed away from this region of illogical judgments. RAPHAEL MENGES is one of them. REYNOLDS met him in Rome, and rashly assumed he was over-conceited. After several years had elapsed the unfavourable opinion remained, and when REYNOLDS attained the dignity of president of the Royal Academy he could gratify himself by endeavouring to make the students scorn MENGES as a type of a class that was to be avoided. In his sixth discourse he said :—

I remember, several years ago, to have conversed at Rome with an artist of great fame throughout Europe ; he was not without a considerable degree of abilities, but those abilities were by no means equal to his own opinion of them. From the reputation he had acquired he too fondly concluded that he was in the same rank, when compared with his predecessors, as he held with regard to his miserable contemporary rivals. In conversation about some particulars of the works of Raphael he seemed to have, or to affect to have, a very obscure memory of them. He told me that he had not set his foot in the Vatican for fifteen years together ; that he had been in treaty to copy a capital picture of Raphael, but that the business had gone off ; however, if the agreement had held his copy would have greatly exceeded the original. The merit of this artist, however great we may suppose it, I am sure would have been far greater, and his presumption would have been far less, if he had visited the Vatican, as in reason he ought to have done, at least once every month of his life.

The conclusion which REYNOLDS must have desired his auditors would draw from the anecdote was that MENGES was a sort of LUCIFER, who imagined he was more than a demigod, and equal to the greatest among the immortals in art. If he were, he expressed his opinions of his predecessors in an unusual way. It would hardly be supposed that MENGES was more reverential than the President himself. There are no passages in the "Discourses" in which RAPHAEL is mentioned which are as laudatory as those penned by MENGES. According to MENGES, the foremost rank among painters must be given to RAPHAEL, because he possessed the power of expression in a supreme degree, and it was found in all his works. In his figures he avoided all unnecessary action, and there is not a stroke of the pencil without its use in any of his paintings. RAPHAEL'S qualities, said MENGES, appeal to the mind rather than to the eye, and they cannot in consequence be appreciated until they are understood. His spirit was philosophic, and was not touched by little things, but by whatever was grand. Then he perceived the relations between the parts, and could express them in the way that was most striking to the spectator. There is the most sincere admiration of RAPHAEL'S genius to be found throughout MENGES'S writings. His criticism has, too, a precision which REYNOLDS has nowhere attained. RAPHAEL'S anatomical knowledge, skill in modelling, his chiaroscuro, treatment of drapery and his colouring are analysed with a closeness that is evidence of the most exact knowledge of the master's works.

It may be asked, How could MENGES, if he possessed so much knowledge, have refrained from visiting the Vatican for several years? In the first place, the failure to obtain an expected commission for copying one of RAPHAEL'S pictures would be a reasonable excuse for his absence. That a man like MENGES, who held a high opinion of his own inventive powers, was willing to copy a painting was a condescension, and the rejection of his offer must have brought him heartburning. REYNOLDS could be very touchy when his dignity appeared to be slighted, and he should have made allowance for a brother artist who was admitted to be supreme in Rome. There was another reason, of which REYNOLDS was not aware. Men do not always love the schools in which they were overworked. The Vatican was one of those schools for MENGES. From his infancy he was treated as a prodigy, who had only to be subjected to the hardest training and he must accomplish wonders. His father, who was a painter in enamel, anticipated a glorious future for his son, as he had conferred on him at the font the names ANTONIO and RAPHAEL, with the conviction that the child must one day unite in himself the genius of CORRÉGIO and RAPHAEL. ISMAEL MENGES resolved that nothing should be wanted on his part to ensure so desirable a consummation. The unhappy child was allowed to have no plaything but a porte-crayon. He was not taught to read until he could draw objects with accuracy. When he was six, young MENGES was

brought from his native village, Aussig, in Bohemia, to Dresden, and there the forcing system was carried on more rigorously. He was compelled to draw geometrical figures until he needed neither rule nor compass to produce right lines and circles. The O of GIOTTO would be insignificant to him. Other exhilarating studies followed, such as perspective, anatomy, light and shade, &c., while his father supplemented them by giving him instruction in chemistry. Then he was allowed to try his hand on enamels, miniatures and pastels. But the elder MENGES considered his son's training in the six years passed in Dresden was not sufficiently comprehensive, and when the boy was twelve he was conducted to the Vatican. If we remember rightly, one of the principles of the Pestalozzian system, especially when dealing with promising boys, was solitary confinement. ISMAEL MENGES anticipated it. In some mysterious way he was able to persuade the authorities to allow him to convert the Vatican into a prison. From early morning until an hour when drawing or painting was impossible through want of light, RAPHAEL MENGES was confined in one or other of the chambers, with no more provision than bread and water. He was able to endure for no less than three years continuously so exhausting a treatment. Then he was allowed to go back to Dresden for a short holiday. When it was ended he returned to Rome, and he resumed his studies under his father's supervision. His time was divided between the antique statues, the works of MICHEL ANGELO and RAPHAEL, and the anatomy school of a hospital. After four years of advanced studies he was considered competent to undertake the painting of a *Holy Family*. We may suppose RAPHAEL MENGES to have possessed a German's reverence for all that helped his own culture, but he must have been more than mortal if, as REYNOLDS desired, he could have visited the Vatican once a month. The fact was, MENGES'S acquaintance with the treasures of that palace was too complete. He was so versed in ancient ways, he found it difficult to allow his natural abilities any freedom. MENGES applied a Greek standard when judging all questions of form, and his own works were not exempted.

It is not impossible that the manner which gave offence to REYNOLDS, and which he supposed to be conceit, was merely an effort to explain how far the works of RAPHAEL, MICHEL ANGELO, CORRÉGIO and TITIAN, or later artists, were inferior to the works of the Greeks as an expression of the beautiful. The English artist was never enthusiastic about Greek art ; when he had to refer to the sculpture he spoke with restraint. He appeared afraid of being led astray by a sort of will-o'-the-wisp if he sought after ideal beauty. Accordingly he warned the student against speculations which "may make him neglect what is essential to his art, correctness of design, in order to pursue a phantom which has no existence but in the imagination of affected and refined speculators." MENGES was without any misgiving of that sort. He endeavoured to obtain a clear notion of the beautiful, of the cause of its appearance in visible things, of its effects and so on. MENGES could not pursue an inquiry of the kind without discovering how far beyond all other men the Greeks had advanced not in only formulating theories of the beautiful, but in realising it. The highest art he considered was an expression of the ideal, and as the Greeks succeeded with it beyond any of the moderns, they came nearest to a revelation of what is attainable by man. MENGES was not practised in psychology, and his efforts to find a basis for his creed in art are as remarkable as any that are recorded in the history of philosophy. His labour must have been painful, for he does not advise the young artist to pursue a similar process ; it will be easier, he says, to study masterpieces. Let the student, says MENGES, examine pictures by RAPHAEL, TITIAN and CORRÉGIO ; let him meditate over whatever he considers beautiful in each, and if in the productions of one of those masters he finds certain parts which are well thought out and well executed, he may conclude they were those over which the artist was mainly occupied and are the most characteristic. The recommendation of the earnest study of pictures by renowned masters hardly seems to indicate that the teacher was envious of their reputation or believed he was their equal or superior. REYNOLDS may have thought he was justified in prophesying a few years after MENGES'S death that the

artist's name would fall into "what is little short of total oblivion," but MENGES did not merit that fate by any exhibition of jealousy or presumption in his "Gedanken über die Schönheit und über den Geschmack in der Malerei," and judging by what many of his contemporaries said of him, his conversation was as free from littleness as his essays.

As we have said, MENGES possessed a code of laws which to REYNOLDS was like a sealed book. The President's ideal of the highest style was found in the works of the CARACCI—at least for the purposes of his discourses, for in his own practice he was faithful to one of a different class—while MENGES preferred the Greek sculpture which was to be found in Rome. From those examples he deduced a theory of the development of art. He fancied that sculpture came before painting, since it is easier to give a form to an object that is seen on all sides than to one that is represented on a flat surface. At an early period there were, he says, principles established; for if every artist followed his own caprice there would not be so close a resemblance between the proportions, and especially between the heads of the earlier figures. In the second period it was evidently perceived that figures were too commonly made meagre, and a massiveness that was often excessive was imparted to them. Refinement followed, and the group of the *Niobe* is cited as a work which possesses perfection in the proportions of the figures and a sublimity in the forms, but the contours are a little too rigid, and there is a want of that *morbidesse* and elegance which were common in the works of a later time. For those qualities MENGES believed the sculptors were indebted to the works of painters who had been also advancing. That for a time painting obtained pre-eminence of sculpture in Greece was inferred from a decree of PHILIP OF MACEDON, by which only freemen were allowed to receive instruction in the art. MENGES apparently was in favour of some restriction in the arts, for he said that the principal cause of the subsequent decadence arose from the immense number of artists to be found in Greece and Italy. When by wars and revolutions the patrons decreased, it became necessary to produce works of an inferior class to please the common people, in order to enable the artists to live. Art suffered in consequence.

MENGES was not satisfied to trace a general outline of the progress in art. He explained how the details of the figures were treated in the various periods. His conclusion was that with the Greeks there was a variety in the details, and especially in curves, which was not to be found in modern works. There was no man in the middle of the eighteenth century who possessed a more exact knowledge of the sculpture in Rome than RAPHAEL MENGES. When he spoke to REYNOLDS about keeping away from the Vatican, he was likely to mean that part only where RAPHAEL'S wall-pictures are to be seen. His acquaintance with the characteristics of the statues could only be attained by study that was always kept up. From his knowledge he was well fitted to give definiteness to the speculations of WINCKELMANN, for the germ of the best criticism in the "History of Art" is to be found in the essays by MENGES. That WINCKELMANN was allowed to believe a painting by MENGES—the *Jupiter and Ganymede*—was one of the most perfect examples of ancient art, and to publish a eulogy upon it, was carrying practical joking too far; but there is always a temptation to demonstrate the value of a critic's omniscience. The two men, however, remained in friendship, and exhibited it occasionally in ways that must excite amazement, and of which DAMON and PYTHIAS would never approve.

As a painter MENGES could not escape from the fastidiousness which unceasing study of masterpieces always produces. We have described the training to which he was subjected before he was allowed to undertake a picture. His *Holy Family* was a success. But his father believed that a further course of training would be an advantage for RAPHAEL MENGES, and compelled him to return to Dresden. When after a while the son appeared discontented with the endless preparatory toil, the stern father turned him out of the house, and RAPHAEL was left to shift for himself. As has often happened with young fellows in desperate straits, he married, his choice falling on MARGHERITA GUAZZI, who had served as model for the

Blessed Virgin in his *Holy Family*. AUGUSTUS III. fortunately took him under his protection, and appointed him first painter, an office by which he was provided not only with a salary, but with a house and a carriage. He was first employed on paintings for the side walls of the new chapel of the palace. The picture for the high altar he wished to paint in Rome, and he received permission from the king. While he was engaged on the work in Rome there was a collision between Saxony and Prussia, and one effect was the stoppage of the allowance to MENGES. The artist was in such distress he was glad to paint the vault of the Convent of the Celestines for the small sum of 200 piastres. Later on he painted the ceiling in the Villa Albani, the subject selected being *Apollo and the Muses*. He executed some other works in Rome, but as he had to compete with "miserable contemporary rivals" his life for some years was not enviable. Happily for MENGES he was invited by CHARLES III. to Madrid, and there obtained a salary of 2,000 doubloons, with a house and coach, besides all the expenses connected with any paintings he might execute. That was in 1761, and MENGES was then in his thirty-third year.

The trials of his youth and early manhood which he had sustained so manfully produced their effects as soon as prosperity arrived. MENGES became melancholy. He was allowed to return to Rome, where his family remained, and after a time he recovered sufficiently to become competent to paint the *Adoration of the Shepherds* and the *Christ Appearing to Mary Magdalen*. The former is in the Madrid Gallery, and is one of his finest compositions. He also painted in Naples portraits of some of the relatives of his patron. When his health was restored he returned to Madrid and completed the oil-paintings and frescoes which he had commenced during his first sojourn in the city. The climate of Madrid was not suited to his physique, and after a few years he was compelled to again seek health in Rome. There he remained until his death in 1779. A portrait of him was placed in the Pantheon, which described him as "Pictori Philosopho."

In the eighteenth century it was supposed to be doubtful whether nature could endow a German with taste. MENGES, who was immured in the Vatican in his twelfth year, and who spent the best part of his life in Rome, was more of a Roman than a German. Like WINCKELMANN, he was, however, a gage of what Germany was to become in art and aesthetics. As we have suggested, he was too much of a student—the pale cast of thought is over all his works. He believed that the Greeks owed their supremacy to their mastery of detail, and accordingly never touched a canvas or a wall with a pencil until he had made exhaustive studies of every part of a picture. After such preparations his ardour had cooled, and he commenced painting, as it were, in cold blood. There was always something of the enameller about his use of colour: he employed it like a man of science rather than a painter. Yet so severe a critic as BURCKHARDT does not hesitate to say that MENGES was the only artist of his time in whom the commencement of a more profound ideal view is visible. His ceiling at St. Eusebio is described as dignified and solemn, his work in one of the Egyptian rooms of the Vatican as a suggestion of the German monumental style, while his portraits are said to be more grand and true and less pretentious than any of those by his Italian contemporaries. His works in Spain have been no less admired. There are, however, few works by him in foreign galleries, and consequently his merits must be taken on trust. MENGES was a man with the loftiest aims, and he may have miscalculated his strength; but as an artist or a man he never deserved the censures which REYNOLDS expressed and which are calumnies.

Mr. G. Laurence Gomme has received a testimonial in recognition of his services both to the science of folk-lore and to the Folk-Lore Society, of which he and the late Mr. J. W. Thoms were the founders in 1878. Mr. Gomme retired from the presidency last year, and a movement was thereupon set on foot for presenting him with an illuminated address and a personal gift, and, at the same time, for starting a "Gomme Testimonial Fund" for the encouragement and assistance of research and study in folk-lore.

GLASGOW ARCHÆOLOGICAL SOCIETY.

A MEETING of the Glasgow Archæological Society was held on the 18th inst. Dr. James Macdonald presided. The Chairman said that the Council had unanimously resolved to recommend that Dr. David Murray be elected president till November, in room of the late Mr. C. D. Donald. This was unanimously agreed to, and Dr. David Murray took the chair.

Mr. F. T. Barrett read a paper on "Local Place Names available for the designation of Civic Wards." He remarked that two months ago the late President proposed that the Society should approach the municipal authorities with a suggestion that when the new wards into which the city was about to be divided were arranged, the official designation of such wards should be by names, instead of, as at present, by numbers, the names selected to be such as were associated historically with the localities included within each ward respectively. The practical advantage of such a change was obvious. A number did not of itself suggest any idea of locality, while a name known historically brought to the mind at once the quarter of the city indicated. What the Archæological Society was interested in was to maintain, as far as the changing conditions of the times would permit, all the associations which linked the present with the past. Until the delimitation of the new wards had been accomplished it would of course be premature to make any definite suggestion as to the names they might suitably bear; but it might not be improper, even at this stage, to inquire as to the existence of local names suitable for the proposed use. That Glasgow possessed a wealth of such names historically suggestive and racy of the soil was at once apparent. A list, somewhat hurriedly compiled, mainly from Mr. David Robertson's index to his edition of "Glasgow, Past and Present," gave three times the number required, and no doubt others would occur to members of the Society. The names were of several classes. There were the old communities which, formerly self-governing, had been incorporated with the city, such as Anderston and Gorbals; burghs of relatively recent date, as Crosshill and Hillhead; parochial and ecclesiastical divisions, as Barony and St. Andrews; estate names, as Blythswood and Kelvinside; important buildings, as Cathedral or Royal Exchange; historical and leading thoroughfares, as High Street, Bridgegate, or Cowcaddens; public spaces, as George Square or Queen's Park; districts named after individuals, proprietors and others, as Finnieston or Kingston. The imperfect list now submitted contained over eighty names. Of these, on a rough geographical analysis, sixteen belonged to the eastern districts, twenty-one to the central, sixteen to the western, eleven to the northern and seventeen to the southern portions of the city. It was obvious, therefore, that ample materials existed for giving to each of the twenty-five wards, when they were newly settled, a name at once familiar, historical and characteristic. In the east there were Bellgrove, Blackfriars, Bridgeton, Calton, Camlachie, Cathedral, Dalmarnock, Dennistoun, Drygate, Gallowgate, Garngad Hill, the Green, Molendinar, Parkhead, St. Andrews and Whitevale. Central—Barony, Blythswood, Bridgegate, Broomielaw, Candleriggs, Cowcaddens, Cross, Garnethill, George Square, Grahamston, Grey Friars, High Street, Jamaica Street, Rams-horn, Royal Exchange, St. Enoch's, St. George's, Saltmarket, Stockwell, Tolbooth and Trongate. West—Anderston, Burnbank, Cranstonhill, Dowanhill, Finnieston, Gilmorehill, Hillhead, Hyndlands, Kelvingrove, Kelvinside, Overnewton, Sandford, Sauchiehall, Stobcross, Woodside and Yorkhill. North—Cowlares, Keppochhill, Maryhill, Port Dundas, Possilpark, Rockvilla, Ruchill, St. Rollox, Sighthill, Springburn and Townhead. South—Camphill, Coplawhill, Crosshill, Crossmy-loof, Gorbals, Govanhill, Hutchesontown, Kingston, Langside, Laurieston, Paisley Road, Pollokshields, Polmadie, Queen's Park, Shawlands, Strathbungo and Tradeston.

Mr. Edwards said that the Act provided that the wards should be numbered; but the designations could be added to the numbers.

The Chairman remarked that difficulty could be easily overcome if the Town Council should think well of the proposal, seeing that they were going to Parliament every year.

Councillor R. Anderson said he was afraid that if it should be resolved to have designations there would be quarrelling over the names to be chosen.

On the motion of the Chairman a vote of thanks was awarded to Mr. Barrett for his paper.

Dr. James Macdonald read a "Note on the Excavation of a Roman Bath at Newfield, Dundonald, Ayrshire." Owing to unexpected difficulties that were encountered, Dr. Macdonald said the excavation was not so complete as was intended. It showed, however, quite conclusively that the basin could have been no bath either Roman or native, but was probably some provision for watering horses or cattle on the farm of Boghead. The paper was illustrated by drawings made on the spot by Mr. Emmet Brady.

The Chairman said that a more complete example of Jonathan Oldbuck's prætorium had never before come under his observation, for Dr. Macdonald's explanation of a horsepond being converted into a Roman bath was perfect. It showed that Sir Walter Scott, with his love of antiquity, and his clear and sound judgment, was very much alive to the manner in which the antiquarians of his day were imposed upon. Mr. Train, with a little imagination, had suggested a Roman bath; Mr. Chalmers put it into his "Caledonia," and the worthy parish minister of Dundonald had followed suit, but Dr. Macdonald's explanation of what it was was perfect.

THE LATE SIR GEORGE SCHARF.

THE country has lost an able servant by the death of Sir George Scharf, K.C.B., late director of the National Portrait Gallery, on the 19th inst. George Scharf, whose early work used to be signed "George Scharf, jun.," was, says the *Times*, the son of a Bavarian artist of the same name, who settled in London in 1816. He himself was born in London in 1820, and lived in England all his life; he was educated at University College School, and afterwards was a student at the schools of the Royal Academy. He early began to illustrate books, but before he had made any deep mark in that capacity he went to Lycia with Sir Charles Fellows, and occupied himself in making a very large number of accurate drawings, many of them in outline, of scenery and classical remains. These afterwards formed the basis of his illustrations to Sir Charles Fellows's book; the originals are now in the British Museum. In 1847 and 1849 he made two great successes with his illustrations of Macaulay's "Lays" and of Dean Milman's "Horace;" the original edition of the latter is now a scarce and costly book by reason of Scharf's beautiful drawings from gems and statues. Other books which he illustrated about that time or a little later were some of Smith's classical dictionaries and Mrs. Bray's "Life of Stothard." He soon, however, began to show that he possessed a real and rare talent for investigating the antiquities of art, as well as for practising art. He lectured at the Royal Institution, he wrote here and there an authoritative article, and in 1857, when the famous Manchester Art Treasures Exhibition was projected, Mr. Scharf was appointed art secretary. Already he was pretty familiar with the great English collections, but his official position gave him fresh opportunities, which he turned to excellent account. In the same year, 1857, the National Portrait Gallery was founded, and Scharf was very naturally appointed to be secretary to it, and practically had to form it from the beginning. To describe his method and his success, in spite of chronic difficulties with a parsimonious Treasury, would be to write the history of the National Portrait Gallery, which, coming into existence less than forty years ago, will presently on its migration to its new and splendid home behind the National Gallery be seen to have grown into a noble, extensive and representative collection. It is not too much to say that the collection owes its existence and almost all its development to George Scharf. Possessed of an eye of remarkable accuracy, of an extraordinary talent for testing likenesses, and of a still more extraordinary memory (which he habitually aided and kept in order by a vast series of sketch books), he had also two other highly important gifts. He was a student of history and literature, and he was, till physical infirmities came upon him, ready and eager to travel that he might extend his knowledge. In many great houses he had been an honoured guest for forty years, and his catalogues made long ago are still in essential points the authorities on such collections as that at Woburn Abbey and that which used to be at Blenheim. His historical knowledge was considerable—witness the elaborate and really learned letters on the "portraits of Mary Queen of Scots," which were printed from his hand at the time of the Tudor Exhibition. In the formation of such exhibitions his help was invaluable; he, as a member of the committee, was the general referee and court of final appeal in questions of a disputed attribution. But his life's work was the National Portrait Gallery. He watched it from the beginning; he was primarily responsible for the purchases made and for gifts accepted or declined, although, of course, the nominal responsibility lay with the board of trustees—a body chosen rather on grounds of eminent respectability than as likely to contribute much expert knowledge. It was in a great measure owing to Mr. Scharf's often urged plea of the dangerous nature of the old gallery at South Kensington that the portraits were moved some years ago to Bethnal Green, until a new gallery could be provided for them, a difficulty which, as is well known, was solved by the munificence of Mr. Alexander, who is said to have given something like 100,000% towards the building now on the point of being completed.

When Mr. Scharf reached his seventieth year, in 1890, remarkable and unexpected testimony was borne to his merits, and, indeed, to his indispensableness. By the new Treasury

minute he would have been compulsorily retired; but it was generally felt by the trustees and others in authority that, in the state of transition in which the affairs of the gallery then were, it was highly desirable that he should remain. Accordingly, a very strong memorial was sent in by the trustees, accompanied by letters from Mr. Gladstone and other leading men, which made it plain that in their opinion Mr. Scharf's gifts and qualifications were absolutely unique. He accordingly remained, though it was plain to any one who met him at exhibitions or in auction-rooms that his physical disabilities were growing very rapidly. His curiously unwieldy figure was a perpetual difficulty to him; every winter he was in imminent danger of dying of bronchitis; but he still fought on till his resignation only a very few months ago. He had been made a C.B. in 1882, and on his retirement he was made a K.C.B. and a trustee of the Portrait Gallery, the information of the Queen's intention so to honour him being conveyed in a most appreciative letter by the Prime Minister.

As we recently announced, Sir George Scharf is succeeded as director of the National Portrait Gallery by Mr. Lionel Cust, assistant keeper of the prints in the British Museum.

EXPLORATION IN PALESTINE.

DURING the winter months, when excavation becomes difficult or impossible at Jerusalem, Dr. Bliss received the sanction of the committee to undertake a journey to the Land of Moab, including the examination of Medeba, Kerak and other places of historical interest beyond the Dead Sea. Dr. Bliss had the special advantage of a letter of recommendation from His Excellency Hamdy Bey, the well-known director of the Museum of Constantinople. He was received most cordially by the Governor of Kerak, and was afforded the fullest permission to measure and make plans of buildings, to copy inscriptions, &c. After a journey of very great interest he got back to Jerusalem on April 2, and at once resumed the work of excavation. A preliminary report of his journey has been received, and full details will follow later. Dr. Bliss has discovered a previously unknown Roman fort and a walled town with towers and gates like the interesting town of M'Shita. The committee have appointed Mr. Archibald Campbell Dickie, architect, to go out and assist Dr. Bliss in the work, and especially in drawing plans, sections, &c. He has already arrived in Jerusalem. The excavations are costly, and funds are much wanted for their continuation.

PRIVATE HOUSES AS HOSPITALS.

IN Dublin the Vice-Chancellor gave judgment on the 17th inst. in the case of the Earl of Pembroke v. Mr. Graves Warren, Mrs. Elizabeth Shekleton and Mrs. Perry, which was argued during the last sittings. The Earl of Pembroke sought for an injunction to restrain the defendants from carrying on the business of an hospital in the house No. 28 Fitzwilliam Square, in breach of a covenant contained in a lease of June 27, 1822, from the then Earl of Pembroke to Clement Codd. The lessor's interest in the premises was vested in the present Earl, and the lessee's interest was vested in Mr. Warren, under whom the other defendants were sub-lessees. The covenant enumerated several trades or businesses which should not be carried on in the house, and concluded with the words "or any other offensive or noisy trade, business, or profession whatever." Lord Pembroke was the owner of the ground on which the house in question and the other houses in Fitzwilliam Square were erected; and he formed the plan of letting it for the erection of private residences with an enclosed pleasure ground, and in 1813 he obtained a private Act of Parliament, under which a body of commissioners was formed for the management of the square, and invested with the power of taxing the inhabitants for the payment of the necessary expenses and regulating the use of the grounds. All the leases, he believed, were similar to that in the present case, and the lessees were to erect the houses at their own expense. The entire nature of the lease in question and the circumstances under which the letting was made were, in his (the Vice-Chancellor's) opinion, strongly in favour of the existence of an intention on the part of the lessor that the houses should be private residences. The present case depended on whether an "hospital" came within the general words, "or any other offensive or noisy trade, business, or profession whatsoever." The object clearly was to prevent, as far as possible, the houses in the square from being converted to any purpose that might be offensive to or annoy the neighbourhood or depreciate the value of the property. The Vice-Chancellor then referred to the authorities bearing on the case, and to the affidavits made by residents in the square, medical men and others, from which it appeared that as soon as Mrs. Perry's intention to transfer the private hospital which she had previously conducted in a house in Harcourt Street to the house in Fitzwilliam Square was known, the residents in the

square and the commissioners protested against it and called on Lord Pembroke to interfere. Mrs. Perry was fully aware of the covenant contained in the original lease before she opened the house as an hospital on February 16 last. The affidavits of Messrs. North and Battersby proved that the use of the house as an hospital would seriously depreciate the value of the property of which it formed part. Admittedly the patients intended to be received in it would include surgical, medical and hysterical cases, and although the defendant had given evidence to show that the utmost care would be taken to exclude infectious cases, medical men who had given evidence for Lord Pembroke had stated that, in their opinion, it would not be possible to do so. He was of opinion, after a full and careful consideration of the whole case, that the act of the defendants, Mrs. Shekleton and Mrs. Perry, in setting up this hospital was a breach of the covenant in the original lease and should be restrained. He should therefore make the order for an injunction, but it should not come into operation until June 1, in order that the defendants might have an opportunity, if they desired it, of taking the opinion of the Court of Appeal on the case, and also to give Mrs. Perry time to make other arrangements for the carrying on of her business. He would reserve the question of costs.

TESSERÆ.

The Progress of Mediæval Architecture.

IN the architecture of all building nations, logical deductions follow one another with fatal severity. One step forward can never be the last, one must always go on; from the moment that a principle is the result of reasoning, it at once becomes its slave. Such is the spirit of the Western nations; it comes out as soon as the society of the Middle Ages begins to be conscious and to organise itself; it could not be checked, for the first man who founds a principle upon a course of reasoning cannot say to reason, "Thou shalt go no further." The builders in the shadow of the cloisters recognised this principle from the time of the eleventh century. One hundred years later they were no longer the masters of it. Bishops, monks, nobles, commoners, had they wished, could not have prevented the Romanesque architects from producing the architecture termed Gothic; the latter was only the predestined consequence of the former. Those who pretend to see in Gothic architecture, entirely secular, anything else than the emancipation of a nation of artists and artisans, who, having been taught to reason, reason better than their masters, and with the forces put into their hands carry them in spite of themselves very far from the goal that at first they wished to reach; those who believe that Gothic architecture is an exception, a caprice of the human mind, have certainly not studied its principle, which is but the rigorous application of the system inaugurated by the Romanesque constructors.

Sculpture in Pediments.

The practice had obtained among the sculptors and architects of Greece, in a very early period of the art, of introducing groups of statues to occupy the triangular space above the porticoes of the temples. The description in Diodorus Siculus of the sculptures on the pediment of the Temple of Jupiter at Agrigentum, representing at one extremity the Battle of the Giants and at the other the taking of Troy—the Twelve Labours of Hercules on the fronton of the Temple of Hercules at Thebes, by the hand of Praxiteles—the Calydonian Boar Hunt, described with so much detail in the 8th book of Pausanias, on the Temple of Minerva Alea at Tegara—those in honour of Bacchus and Apollo, on the two frontons of the Temple of Apollo, at Delphi, by the hands of Praxias, the pupil of Calarnis, and of Androthenes, the pupil of Eucadmus, both of them Athenian artists—but above all the magnificent Temple of Jupiter at Olympia, all these instances present a strong body of evidence that a building of the character of the Temple of Minerva at Athens would not have been left by Pericles with a bare pediment, and if Phidias did place any sculptures there it can hardly be doubted that they were amongst the most distinguished works of that artist and of his pupils. No subjects of ancient fable are more frequently alluded to in the poets and historians of Greece and Rome than the contest between Minerva and Neptune, the birth of the former and the battle of the Centaurs and Lapithæ. One instance of this nature bearing an immediate allusion to the present subject may be adduced from the 6th book of Ovid's *Metamorphoses*. The poet is relating the contest between Minerva and Arachne for the honours of the loom. The goddess is appropriately described as tracing upon her tapestry her former contest with Neptune for the honour of naming the capital of Greece. The subject of the tapestry is the same with that of the statues upon the temple. The goddess herself is represented producing, as the utmost effort of an imitative art, the same picture which already adorned her own temple in her own city.

English Brass.

Queen Elizabeth, in 1565, granted by patent all the calamine in England and within the English pale in Ireland to her assay master William Humphrey, and one Christopher Shutz, a German, and, as the patent sets forth, a workman of great cunning, knowledge and experience, as well in the finding of calamine as in the proper use of it for the composition of the mixed metal called latten or brass. With these patentees were soon after associated some of the greatest men in the kingdom, as Sir Nicholas Bacon, the Duke of Norfolk, the Earls of Pembroke and Leicester, Lord Cobham, Sir William Cecil and others, and the whole were incorporated into a society, called the Society for the Mineral and Battery Works in the year 1568. Mines of latten, whatever may have been at that period meant by the word, are mentioned in the time of Henry VI., who made his chaplain, John Bottwright, comptroller of all his mines of gold and silver, copper, latten, lead, within the counties of Devon and Cornwall; yet we are disposed to think that the beginning of the brass manufacture in England may be properly referred to the policy of Elizabeth, who invited into the kingdom various persons from Germany, who were well skilled in metallurgy and mining. In 1639 a proclamation was issued prohibiting the importation of brass wire, and about the year 1650, one Demetrius, a German, set up a brass work in Surrey, at the expense of 6,000*l.*, and about 8,000 men are said to have been employed in the brass manufactories which were established in Nottinghamshire and near London. Yet Sir John Pettus, in his account of royal mines, published in 1670, observes that these brass works were then decayed, and the art of making brass almost gone with the artists. But though the art was then almost gone, yet it was never, after its first establishment, altogether lost, for about the year 1708 we find that there were brass manufacturers in England, and that they presented a memorial to the House of Commons, setting forth several reasons for continuing the brass manufactory in this kingdom, and soliciting for it the protection of Parliament. In this memorial they stated that England, by reason of the inexhaustible plenty of calamine, might become the staple of brass manufacture for itself and foreign parts; that the continuing the brass works in England would occasion plenty of rough copper to be brought in, and make it the staple (in time) of copper and brass; that the Swedes had endeavoured to subvert the English brass manufacture by lowering the price of Swedish brass wire, inveigling away workmen and other means. In compliance with the purport of this memorial, an Act of Parliament was passed in the same year by which the former duties payable on the exportation of copper of the produce of Great Britain, and of brass wire, were taken off, and these articles were allowed to be exported free of duty. In 1720 it was remarked that this nation could supply itself with copper and brass of its own produce sufficient for all occasions, if such duties were laid on foreign copper and brass as would discourage their importation, and at the same time encourage the sale of their own metals.

The Domestic Chimney.

The strongholds which were erected about the period of the Conquest consisted of several storeys, and their roofs were used as a terrace for defence, thereby rendering the central hearth and opening impracticable; but as it was necessary to provide some exit for the smoke, the fireplace was made in the wall, and terminated in a loophole on the outside; this was an important step towards the construction of the chimney. Conisbrough and Rochester Castles furnish examples of this contrivance, which prevailed, without much variation, from the twelfth to the fifteenth century. Until the latter period the chimney, properly so called, appears to have been little known in England, or indeed in many other parts of Europe. The ancient Romans seem not to have been acquainted with it; and there is no trace of it in Italian houses up to the fourteenth century, by the middle of which it had become common at Venice, for an inscription over the gate of the school of Santa Maria della Carita states that in the year 1347 a number of chimneys were thrown down by an earthquake. We learn also from Muraton that in 1368 a prince of Padua, on making a journey to Rome, took with him masons to make a chimney at the inn at which he put up, "because in the city of Rome they did not then use chimneys, and all lighted the fire in the middle of the house on the floor." But, as Mr. Turner remarks, in seeking to ascertain the antiquity which should be assigned to chimneys, facts are often at variance with the statements of respectable writers. Existing remains prove that perpendicular flues were constructed in England in the twelfth century; yet Leland, writing in the sixteenth century, speaks with surprise of a chimney in Bolton Castle, which he says was "finiched or Kynge Richard the 2 dyed." One thynge I much notyd in the hawle of Bolton, how chimeneys were conveyed by tunnells made on the syds of the walls betwixt the lights in the hawle, and by this means, and by no covers, is the smoke of the harthe in the hawle wonder strangely conveyed." We can only suppose with Mr. Turner that the

principle of the modern chimney was understood long before the construction itself became general. The cost of remodelling the house would in very many cases prevent the improvement. In drawings of the time of Henry III., chimneys of a cylindrical form are represented rising considerably higher than the roof, and orders to raise the chimneys of the king's houses are frequent in this reign. Nevertheless, it was still the general custom even in the fourteenth century to retain the hearth in the middle of the room. When the wood was fairly ignited the smoke would not be great, and the central position of the fire was favourable to the radiation of heat. This method of warming the hall was continued long after fireplaces with chimneys had been erected in the smaller apartments. By the reign of Elizabeth the advantages of the new system were so well appreciated that ladies in their visits to their friends, if they could not be accommodated with rooms with chimneys, were frequently sent out to other houses, where they could enjoy the luxury.

Fuseli's Aphorisms.

Some enter the gates of art with golden keys and take their seats with dignity among the demi-gods of fame, some burst the doors and leap into a niche with savage power, thousands consume their time in chinking useless keys and aiming feeble pushes against the inexorable doors. He who pretends to have sacrificed genius to the pursuits of interest or fashion, and he who wants to persuade you he has indisputable titles to a crown, but chooses to wave them for the emoluments of a partnership in trade, deserve equal belief. Distinguish between genius and singularity of character; an artist of mediocrity may be an odd man; let the nature of works be your guide. Know that nothing is trifling in the hand of genius and that importance itself becomes a bauble in that of mediocrity—the shepherd's staff of Paris would have been an engine of death in the grasp of Achilles; the ash of Peleus could only have dropped from the effeminate fingers of the curled archer. Genius may adopt, but never steals. All mediocrity pretends. Sensibility is the mother of sympathy. How can he paint beauty who has not throbbled at her charms? How shall he fill the eye with the dew of humanity whose own never shed a tear for others? How can he form a mouth to threaten or command who licks the hereditary spittle of princes? If you wish to give consequence to your inferiors answer their attacks. Michel Angelo, advised to resent the insolence of some obscure upstart who was pushing forward to notice by declaring himself his rival, answered, "Chi combatte con dappochi, non vince a nulla:" who contests with the base loses with all. Genius knows no partner. All partnership is deleterious to poetry and art—one must rule. Art among a religious race produces relics; among a military one, trophies; among a commercial one, articles of trade. Modern art, reared by superstition in Italy, taught to dance in France, plumped up to unwieldiness in Flanders, reduced to "chronicle small beer" in Holland, became a rich old woman by "suckling fools" in England. The colours of pleasure and love are hues. The invention of machines to supersede manual labour will at length destroy population and commerce, and the methods contrived to shorten the apprenticeship of artists annihilate art. "Sineret se plebeculam pascere," said Vespasian to the artist who had contrived a machine to convey some large columns with a trifling expense to the Capitol, and rewarded him without accepting his offer. Expect no religion in times when it is easier to meet with a saint than a man, and no art in those that multiply their artists beyond their labourers.

Public Buildings in India.

The Madras Government proposed the erection of the Lawrence Asylum in 1863-64, at a probable cost of 18,000*l.*, and commenced it without plans or estimates, which were six times called for by the Government of India, and were, when at last (1867) received, found to amount to more than five times the sum originally named, it being at the same time stated that 13,000*l.* had already been expended on "preliminary work." The Secretary of State in 1867 censured the Madras Government for having, "in total disregard of the most familiar rules of the Public Works Department, incurred an expenditure greater than any Local Government could sanction on mere preparations for a further and much greater expenditure, which make the work one beyond the sanctioning power of even the Government of India." He declined to consent to this excessive expenditure, and ordered the substitution of a less expensive project. His peremptory order produced a revised estimate which, together with the expenditure already incurred on preliminary work, the Government of India sanctioned. The whole sum thus sanctioned was 52,000*l.*, but the sanction was so much waste paper, for in the following year (1870) the Madras Government showed an expenditure of 83,000*l.*, stated that this would not nearly suffice, and forwarded a new estimate amounting to 118,000*l.* The Government of India refused sanction to this estimate and stopped the works. The Bombay Government in 1865-66 proposed to build a Government House

near the city of Poona at a probable cost of 35,000*l.*, and this sum was granted by the Government of India "on the express instructions" that the amount should not be exceeded. Two years later the Bombay Government forwarded estimates amounting to 96,000*l.*, and in doing so told the Government of India that "the work had already progressed too far to render any stoppage possible with a view to any material revision of the design." The Government of India "severely animadverted upon" these proceedings, and at once reported them to the Secretary of State, but would not order any stoppage of the works "in consequence of the inconvenience which would have been occasioned to the Governor of Bombay." The Secretary of State then expressed to the Bombay Government (March, 1868) his "entire concurrence" in the censure passed by the Government of India, and his regret that the control over the expenditure of public money, by law imposed upon that Government, should have been "practically set at naught." This censure had merely the effect of bringing into stronger relief the determination of the Bombay Government to set all control at naught, for work called "subsidiary" went on without sanction until the expenditure had risen to 155,000*l.*, and then it was stated that the account would be closed, but this closing did not put an end to the expenditure.

Roman Glass Mirrors.

The Romans, before the time of the Younger Pliny, not only used glass instead of gold and silver for drinking vessels, but they knew how to glaze their windows with it, and they fixed it in the walls of their rooms to render their apartments more pleasant. Now a piece of flat glass fixed in a side of a room is a sort of looking-glass, and if the stucco into which it is fixed be of dark colour it will not be a very bad one. And hence the Romans could not fail of having a sort of glass specula in use, but this, though admitted, does not come up to the point; the question is whether they covered the posterior surface of the glass with a metallic plate. It has been observed that the Romans knew how to make a plate of gold and quicksilver. It appears from Pliny also that they knew how to beat gold into thin leaves and to apply it in that state both on wood and metal. There is, too, a passage in Pliny from whence it may be collected that the Romans began in his time to apply a coat of metal to glass specula, and that this coat was of gold. The passage occurs in the very place where Pliny professes to finish all he had to observe concerning specula. An opinion, says he, has lately been entertained that the application of gold to the back part of a speculum renders the image better defined. It is hardly possible that any one should be of opinion that a plate of gold put behind a metallic speculum could have any effect in improving the reflected image, but supposing Pliny (whose transitions in writing are often abrupt) to have passed from the mention of metallic to that of glass specula, then the propriety of the observation relative to the improved state of the image is very obvious. If we suppose the Romans in Pliny's age to have simply applied some black substance to the back surface of the glass, or even to have known how to put tin behind it, yet the observation of the image being rendered more distinct by means of gold might have been made with more justice than is generally supposed. Buffon is of opinion that a looking-glass made with a covering of gold and quicksilver would reflect more light than one made in the ordinary way with tin and quicksilver, and hence Pliny's expression, "*Certioorem imaginem reddi auro appposito aversis*," will be accurately true. Alexander Aphrodisius flourished towards the end of the second century; he wrote several works in Greek, and amongst the rest two books of problems. One of his problems is this, "Why are glass specula so very resplendent?" The only part of the answer which we are concerned with is, "Because they besmear the inside of them with tin." The Greek word does not clearly point out the manner in which the operation of fixing the tin upon the glass was performed. Pliny uses a Latin word (*illitum*) of exactly the same import as this Greek one when he speaks of copper vessels being tinned, and as in that operation tin is melted and spread over the surface of the copper, there is no difficulty in supposing that the tin may have been, in the time of Alexander Aphrodisius, melted and spread over the surface of the glass when previously heated.

Thomas Hope.

The author of the "History of Architecture," "The Costume of the Ancients," "Anastatius" and other works, travelled in early life over various parts of Asia, Africa and Europe, and, having acquired a facility of drawing, brought home a large collection of sketches, principally of the architecture and sculpture of the different scenes through which he had passed. Soon after his return to and settlement in London he wrote and printed "A Letter, addressed to F. Annesley, Esq., on a Series of Designs for Downing College, Cambridge," in which he notices some of the countries he visited and the architectural

objects he examined as a justification of his motives for criticising the series of plans, elevations, &c., then submitted to him. These criticisms were so poignant and condemnatory of Wyatt's designs that they were rejected, and Wilkins was afterwards employed to commence the college. Purchasing a large mansion in Duchess Street, Mr. Hope devoted much time and study, not only in finishing and fitting up the interior from his own drawings, and partly in imitation of the best specimens of ancient and modern buildings in Italy, but made designs for the whole and for the furniture of the house. Consisting of a picture-gallery, a statue-gallery, drawing-rooms, dining-rooms, cabinets for vases, &c., which he had collected in his travels, this house became an object of popular and fashionable attraction. The drawings which he had made for his furniture, &c., he afterwards published in a folio volume, which led the way to a complete revolution in the upholstery and interior decoration of houses, and also called forth the splenetic comments of the *Edinburgh Review*. Whatever ridicule a literary critic might attempt to cast on the work and on the pursuits of a private gentleman thus engaged, it may be said to have proved truly innocuous; whilst the effects of Mr. Hope's publication and example have been extensively beneficial. They gave occupation, at the time, to many young and aspiring artists, they roused the young to emulation and employed and remunerated the skill of others advanced in life. The genius of young Chantrey was called into action and excitement, whilst the more mature talents of Flaxman were honourably employed. Many artisans as well as artists were awakened to exertion, and were also brought out from the haunts of obscurity and comparative wretchedness and placed in the daylight of patronage and respectability. Mr. Hope declared that he frequently traversed obscure alleys, lanes and courts to find out and employ men of skill and talent in their respective pursuits. "In forming my collection and in fitting up my houses," said Mr. Hope, "my object has neither been an idle parade of *virtù* nor an ostentatious display of finery. I have observed with regret that most persons employed in our manufactures, or in furnishing our habitations, are rarely initiated even in the simplest rudiments of design, whence it has happened that immense expense has been employed in producing furniture without character, beauty, or appropriate meaning." "The Costume of the Ancients," 2 vols. 4to, consisting of 130 engravings in outline, was mostly illustrated from Mr. Hope's own drawings.

The Hour-lines of the Ancients.

The hour-lines on the sundials of the ancient Greeks and Romans correspond to the division of the time between sunrise and sunset. An example of these hour-lines occurs in an ancient Greek sundial forming part of the Elgin collection of marbles at the British Museum, and which there is reason to believe had been constructed during the reign of the Antonines. This dial contains the twelve hour-lines drawn on two vertical planes, with one inclined to each other at an angle of 166 deg., the line bisecting that angle having been in the meridian. The hour-lines actually traced on the dial consist of such portions only as were requisite for the purpose the dial was intended to serve, and these portions are sensibly straight lines. If these lines are continued through the whole zone of the rising and setting semi-diurnal arcs, they will be found to be curves of double curvature on the sphere. The lines indicating the third and ninth hours of the ancients are found by the bisection of all the rising and setting semi-diurnal arcs, commencing from the southern point, where the meridian cuts the horizon, and proceeding till the line reaches to the first of the always apparent parallels, which being a complete circle meets at the end of its first quadrant. At this point the branch of another and similar curve is continuous with it, namely, a curve which in its course bisects another set of semi-diurnal arcs, belonging to a place situated on the same parallel of latitude as the first, but distant from it 180 deg. in longitude. Continuing to trace the course of this curve along its different branches, we find it at last returning into itself, the whole curve being characterised by four points of flexure. If the describing point be considered as the extremity of a radius, it will be found that this radius has described in its revolution a conical surface, with two opposite undulations above and two below the equator. The right section of this cone presents two opposite hyperbolas between asymptotes, which cross one another at right angles. This cone varies in its breadth in different positions of the sphere, diminishing as the latitude of the place increases. The cones, to which the other ancient hour-lines belong, are of the same description, having undulations alternately above and below the equator, but they differ from one another in the number of the undulations, and some of them require more than one revolution to complete their surface. The properties of the cones and lines thus generated may be rendered evident by drawing the sections of the cones on the sphere in perspective either on a cylindrical or on a plane surface.

NOTES AND COMMENTS.

LITHOGRAPHY in London is only recognised as one of the useful arts; in Paris it is esteemed as having as much claim to be esteemed a fine art as etching, or as the best work in black and white. DELACROIX, DECAMPS, FRANÇAIS and other famous painters were glad to employ the process, and many artists continue to imitate them. As a consequence, finer lithographs are produced every year in Paris than elsewhere. It is therefore right that the centenary of the art which occurs this year should be celebrated in Paris, although ALOYS SENEFELDER, the discoverer, was a native of Prague. It is proposed to hold a great exhibition of lithography in the galleries of the Champ de Mars from August until the end of November. Ministerial patronage for the undertaking has been secured. In consequence, the finest examples in the public collections can be obtained, and many amateurs have also offered the choice of their portfolios. On the committee are several painters and other artists.

It is intended to arrange the immense antechamber, which resembles a guard-room, on the first floor of the Ministry of Foreign Affairs in Paris as a sort of museum. Various objects will be shown having a relation to the transactions of the department. In addition to historic documents it is expected that a collection of medals will be obtained which are memorials of various events, as well as commemorative paintings, tapestries, pottery, engravings, &c. The room is lighted by an immense window, which opens on the Seine. It is to be filled with a scene from the life of Cardinal RICHELIEU, executed by a new process. The artist, M. ALFRED BETTAMIER, employs red, blue and yellow glass. He tones the colours by acids when necessary, and he obtains his effects by superimposing the pieces, a transparent cement being used. He claims to be able to obtain harmonies of colour which are not practicable by the ordinary process, and the experiments have secured the approval of good judges. There are no lead lines to break up the picture, and in consequence there can be freedom of treatment. Many supposed improvements in glass-painting have been set aside when their novelty ceased to attract, and it has yet to be proved whether M. BETTAMIER's process, however excellent it may be for producing gradations of colour, will make more satisfactory windows than the paintings on immense sheets of glass which the Italians have sent to exhibitions, and which are like very luminous window-blinds.

THE miller who brought and won an action against FREDERICK THE GREAT for interference with his property was probably not braver than the honest Queensferry merchant and his wife, whose action against the Prime Minister has been decided in the Outer House of the Edinburgh Courts. Lord ROSEBURY wished to erect a memorial hall for the benefit of the people of Queensferry, and to obtain a site purchased a house in the High Street of the royal burgh, which has become interesting through the Forth Bridge. It was alleged that he interfered with the plaintiffs' boundary-wall and with their gable, both of which they maintained were their property absolutely. In other words, neither wall nor gable were supposed to be in the same category of mutual ownership as party-walls. The judge decided that the gable was at least mutual property, but his lordship considered that from its height and the use which was made of it on one side and from the position of the chimney-stack, the "skew" and the way the tiles were bedded in the "skew" on the memorial hall, while the slates of the plaintiffs' house were only brought as far as the face of the wall, all seemed to show that the gable was Lord ROSEBURY's property and that the plaintiffs' had only in it a servitude or easement over the gable. As regards the boundary-wall it was decided to be mutual property, and therefore there was no right to open doors in it. All the parties in the suit may claim to have been victorious. Whether the opening of the doors in the wall does not involve grave consequences has yet to be determined, and also how the costs are to be divided. Sticklers for Scotch equity would say that a case of the kind should be allowed to drag its slow length along many a session. It resembles the Queensferry case we read

of in "The Antiquary," which the innkeeper described as "a ganging plea that my father left me, and his father afore left to him. It's about our backyard—ye'll maybe hae heard of it in the Parliament House, Hutchinson against Mackitchinson; it's a weel-kenn'd plea; its been four times on afore the fifteen, and deil onything the wisest o' them could make o't, but just to send it out again to the Outer House. O! it's a beautiful thing to see how lang and how carefully justice is considered in this country." The High Street gable case ought to be of still more importance and it should be honoured accordingly. There are debatable points in it on which all the wealth of the merchant and his wife might be expended.

It is not often there is any tribute of respect paid by clergymen or laymen to the memory of an architect. On that account the words employed by the Rev. Canon AUSTEN at a vestry meeting of St. Hilda's, Whitby, are the more remarkable and deserve to be recorded. The church was designed by the late R. J. JOHNSTONE, of Newcastle-on-Tyne. The Canon said it was one of the special privileges of his life to have under his charge such a noble edifice. Everyone admired it and every succeeding generation would appreciate the magnificence of the structure. People came to Whitby from far and near in no inconsiderable numbers for the express purpose of looking at and examining the church, and all expressed themselves to the effect that it was the work of a great mind. Recently two gentlemen, who were experts, and who from their official position were able to speak with confidence and authority, had examined the building, and they spoke of Mr. JOHNSTONE's work in that church in terms such as any man might be proud of. It was a church which for design and execution could not be surpassed, and brought Mr. JOHNSTONE to the top of the tree in his profession. It was Mr. JOHNSTONE's last work, and he expended a great amount of his strength and energy upon it, and in future years it would be pointed out as one of the best examples of the Gothic style of ecclesiastical architecture there is in this country. Every architect who has seen St. Hilda's Church will admit that Canon AUSTEN's praise was not exaggerated.

THE Governors of the Glasgow and West of Scotland Technical College, having had their attention drawn to the success of the courses in architecture and building construction conducted by Mr. GOURLAY, have recognised the desirability of both recognising this success and strengthening the department by raising the lectureship into a professorship. Mr. GOURLAY, having submitted that he was willing to devote his whole time to the work of the department and to conduct day classes in architecture, a chair of architecture and building construction has been created, and Mr. GOURLAY was appointed as its first occupant. The distinction was well merited, for we have often had to note the success of the architectural and building classes. One of the Professor's first duties was to conduct the students over Glasgow Cathedral on last Saturday, and to explain to them in the building many points which he had referred to in his lectures during the session which is now drawing to a close. The students evinced much interest in what they saw. Attention was also drawn to the various Renaissance monuments in the cathedral and churchyard.

THE "Architect's Certificate Forms" and "Architect's Order Forms for Extras and Additions," published by Mr. SAVORY, of Cirencester, have several advantages. Certificates and orders are numbered, and every one can be thus accounted for. Past payments can be shown. The builder's receipt is also found on the same page as the certificate. The foils are sufficiently ample to allow of duplicate entries. There is also an index-form in each book. The order forms will enable an exact record to be given of extras and additions. As certificates and orders are always liable to be produced in law courts it is well to have them prepared in a way that will satisfy judges and jurors as well as clients. It can be claimed that the new forms will sustain that sort of test successfully.

NEW THEATRE ROYAL, CAMBRIDGE.

THE present theatre was opened to the public in November, 1882, and has continued under the management of its founder, Mr. W. B. REDFERN, to provide accommodation for touring companies visiting Cambridge up to the present time. The Theatre Royal was adapted by Mr. REDFERN for its purpose at a time when dramatic performances were not allowed to be given during term time, except on rare occasions at the Guildhall, and, thanks to careful and judicious management, the theatre soon became recognised as worthy of support and encouragement. The late Duke of CLARENCE, while a student at Trinity College (and then known as Prince EDWARD), was a regular patron of the theatre, and both dons and undergraduates, together with the townsfolk, have continued to attend the performances in large numbers. Many a past member of the University will look back with kindly recollection upon the building which in a few weeks will have ceased to exist.

The growing demand for theatrical entertainments has led Mr. REDFERN to convert the theatre estate into a limited company, with the object of pulling down the old building and erecting a theatre of modern type, with all the latest possible improvements, and affording accommodation for a much larger audience, embracing the middle-class population hitherto uncatered for.

The new building will accommodate upwards of 1,400 people, special provision having been made in the interest of the undergraduates and University audience. There will be pit and stall area, dress circle and gallery, with ten boxes. The stage will be 64 feet across, and have a depth of 38 feet. In the rear will be nine spacious dressing-rooms, cut off from the main building, and with separate emergency exits.

The approaches from St. Andrew's Street are to the pit and gallery, and there is a separate entrance for stalls and for grand circle and boxes, the two latter leading into large crush-rooms, with which the usual offices communicate. Three saloons are provided, two on the area level and one on the first tier. Care has been exercised in arranging the numerous exits, of which there are no less than ten.

The old theatre will be pulled down in the early part of June, and it is anticipated that the new building, of which Mr. ERNEST RÜNTZ is architect, will be ready for occupation immediately after Christmas next, as the plans have received the approval of the Cambridge Town Council.

GOSFORD HOUSE, LONGNIDDRY, N.B.

HALL, AUDLEY END.

IT is believed that Audley End was commenced in 1616, and when completed it must have excited extraordinary admiration. Some of its novelty must have been worn off when PEPYS saw the mansion in 1659-60. He relates how "the housekeeper showed us all the house, in which the stateliness of the ceilings, chimneypieces and the form of the whole was exceedingly worth seeing." Seven years afterwards the Secretary again visited Audley End, and the effect of time on his mind as well as on the building is suggested by what he wrote in his Diary:—"The house indeed do appear very fine, but not so fine as it hath heretofore to me; particularly the ceilings as I always took them to be, being nothing so well wrought as my Lord Chancellor's are; and though the figure of the house without be very extraordinary good, yet the staircase is exceeding poor." In 1669 Audley End received COSMO III., Duke of Florence, with his suite. In the account of the Duke's travels there is the following description of the place:—

Descending into the valley below by an easy acclivity, we came to a spacious avenue planted with elms of considerable height, which terminated at the mansion. The entrance is into a quadrangular court; the sides are surrounded by porticoes of stone which, extending with perfect regularity to the distance of several bowshots, enclose a large meadow. The balustrade which runs round the court is formed on the one side of the letters which comprise the following words, "Sapi-entia est in consilio fortunam semper habere," and on the other with those of the motto belonging to the arms of the Order of the Garter. The interior of the house consists of many apartments, well propor-

tioned and judiciously disposed, and of a well-lighted gallery ninety paces or more in length, having a ceiling of stucco adorned with arabesque and walls lined with wainscot, which is the custom in all houses of the English nobility, as a protection against the cold. The architecture of the palace, although it was built sixty years ago, is nevertheless not regular, but inclines to the Gothic mixed with a little of the Doric and Ionic. The materials of which it is composed are brick, the ornaments of all kinds are splendid and entirely of stone, and the roof of lead. Upon the roof is a gallery, in the midst of which rises a small cupola containing a clock, the sound of which proclaims to a great distance the magnificence of this vast fabric.

Although more than two centuries have elapsed since the foregoing description was written, it is still applicable, for Audley End has been less altered than many buildings of the same age.

SOCIETY OF ARCHITECTS.

A MEETING of the Society took place on Tuesday, Mr. E. J. Hamilton, president, in the chair. The nomination was announced of Dean Farrar, D.D., as hon. member of the Society.

Mr. HENRY LOVEGROVE read the following paper, entitled

Housing the People in London and the Provinces.

Mr. Lovegrove at the outset remarked that the subject was a vast one, and important enough as a question of decent habitation for labourers in a village, but more so in the vast province called London. Legislation, he said, has done much to improve the dwellings of the people, but there is a limit, as if regulations are made too stringent it would be impossible to supply shelter for the poorer classes at all.

Firstly, a few words about the people, beginning as I shall do when considering their dwellings at the bottom and working upwards. Improve the dwellings of these poor wails, the extremely poor, but what of the people themselves? Go and see them in their wretched homes, often one room, and that a kitchen in the back addition of a house originally built for one family. The mother is dirty and untidy, the children are filthy, the bed in the corner is unfit for occupation, the walls and ceilings are nearly black, and the father if at home is a miserable dejected creature, looking little better when away, as if you meet him in the streets he is usually very dirty, slouching along smoking a short pipe, and should he perchance ride in a tramcar or other public conveyance in which he cannot smoke, he amuses himself by expectorating every few minutes to the great discomfort of his fellow-passengers. Now these people being as I have briefly described, and as I frequently see them in my official round, we may well consider what can be done for them, as they would make the best model dwellings filthy in a few weeks. People of this class swarm in many districts in London, and being so plentiful it is a marvel that our Government allows this country to become the sink of Europe, by admitting without question hordes of foreign paupers more disgusting in their habits than the native article, and more likely to break the law, as the records of Worship Street and the Thames Police Court will show, a large portion of the business being connected with the foreign element. Shelter must be found for the lowest and poorest, and the nearest available appears to be a house which, like its fellows in the same street, was originally constructed for one family, with one water-closet of antiquated pattern in the yard and one small sink. In this house three or four families congregate, and as a result the death-rate is very high, and weakly children grow into men and women wanting in stamina. These people are too poor to pay for decent rooms in model dwellings, and it appears impossible to deal properly with them as regards the provision of suitable homes.

We next, he said, have to consider a better class, the wage earning, and it has been the fashion for several years past to build so-called model dwellings for their accommodation. One great mistake has been the pulling down of a number of small two-storeyed dwellings, often with long gardens, and the erection of lofty structures of four or five storeys, so close together that the light is insufficient and the sunlight is unknown. This covering of every inch of land will be prevented in the future by the London Building Act, 1894, which requires that any plans for model dwellings not fronting a street must be submitted to and approved by the County Council, a most excellent regulation. For the erection of blocks of dwellings the land must be cheap, and the return for the investment will be much less than on small houses, large companies with ample capital and long experience being unable to make more than 5 per cent. on the capital. Many dwellings erected by ordinary speculators have been anything but model in their arrangements, indeed it is a wonder that the speculating builder ever touches them, as the average money-lending solicitor will not make the advances so essential to keep the jerry-builder on his legs. The provision by public

bodies of well-planned and well-built dwellings would add very much to the rates, as the income from the rents would not cover the interest on the money expended, and desirable as it may seem for public bodies to undertake such work, the trader and professional classes must be considered, as upon them the heavy rates really press, the rich man, with his large income, not feeling the extra, while the class below cares nothing for rates, theirs being paid by the landlord, who can only get the value of the house, no matter what his outgoings may be by way of rates. But, at whatever cost to the ratepayer, something must be done, especially where large areas are cleared for public improvements. A general rule cannot be laid down to place the provision of dwellings in the same category as the erection of public baths and washhouses, technical schools, public libraries and similar structures for the use and entertainment of a people growing in education and culture. All these things, while necessary or desirable, should fall on the public purse; it ought not to be necessary, as is proposed in Wales, to rob an ancient church of its property for such schemes.

Passing for a moment from the consideration of model dwellings, we consider the usual two-storeyed house, four rooms in the main building and one or two rooms in the back addition. Houses of this type are built in the cheapest possible way; the whole of the walls are one brick thick, the timbers are of the smallest possible scantling and there are many discussions with the district surveyor concerning the use of bats, and of old mortar rubbish for mortar to lay the same. The planning is utterly bad, the frontage much too narrow, the whole being arranged as if for one family. There are many instances of each floor being arranged as a separate dwelling, so that there are no squabbles as to the right to use a common kitchen. Some years since I planned a number of houses two storeys high, each floor complete, and they were built by contract, costing nearly 50 per cent. more than a speculative builder's price, but the superior arrangements and fittings secured good tenants. It must be remembered that the speculative builder employs anybody who can work, so is not troubled by that curse of these days—the trades unions and their tyrannical dictation. I cannot help thinking that small blocks, each to contain six complete dwellings, would pay well if erected in a suitable locality. There would be less of the barrack appearance about them, and not so many stairs to climb.

During the last few years a new departure in the planning of terrace houses of the rental value of from 40% to 50% per annum has proved a great success. Mr. Knightley called attention to them. I had previously seen some erected and shortly after was able myself to put the idea into practical shape. Instead of the back room of the house being placed so that it is darkened by the back addition, the drawing-room is placed in the back addition, the back room in the main building being the kitchen, the space between the back addition of this and the adjoining building being enclosed and covered with a glazed roof to form a scullery. It must be obvious to anybody who has seen many houses that it would be much better if basements could be entirely dispensed with and a wider frontage given, so as to dispense altogether with the ugly back additions, and if the so-called gardens could be a few feet longer, so much the better for the tenants.

The requirements of the London Building Act as to areas at the rear of buildings, the 10 feet clear space and the much discussed angle of $63\frac{1}{2}$ degrees, will be of immense benefit to the people of London. When a rental of from 45% to 60% is reached the builder must be careful to build the right kind of house or his success will be doubtful, as these tenants are very particular; many have good taste and require a miniature mansion. There must be no downstairs rooms, generally called a half-basement; the hall must be tiled, and stained-glass in low quality glazing must give style if not exactly beauty. If the house is what is usually known as double fronted so much the better. The plans exhibited show a very popular kind of house. I know of one estate on which houses similar in plan but inferior in elevation have sold before the first floor joists have been fixed.

I shall deal but briefly with houses of the value beyond 60% per annum, as such people can usually select their residential locality, and can often purchase a house. The same remarks apply to the many blocks of flats for the middle and upper classes. It seems odd that houses of any size cannot be built to let at a remunerative rental, and I have myself proved by a costly experiment that houses built by contract after tender will not sell for what they cost. They must be built in large numbers in the cheapest possible way. Kindly bear in mind the fact that I have come in as a stop-gap, and had to make my notes in a very short time with many other matters pressing. We shall, I am sure, watch with much interest the development of any movement which will assist in the ever-increasing difficulty of providing proper and decent homes for all classes, at prices within their means. We have seen dwellings on a large scale erected by the Industrial Dwellings Company, the Peabody Trustees and others, and we

await the completion of the several schemes now in progress under the control of the London County Council, especially as to the cost per room or at per foot cube, taking into consideration the extra conveniences which may be provided in addition to mere dwelling-rooms. Many provincial towns have made fair progress in the provision of dwellings for the wage-earning classes, but rural districts are still badly off, the sleeping accommodation in labourers' cottages being deficient, and owing to the impoverished condition of the farmer and the squire there is no money to spend on improvements.

A discussion followed, in which the President and following gentlemen took part:—Messrs. G. H. Guillaume, B. R. Tucker, J. R. Manning, W. Allport, H. G. Quartermain and C. A. Bassett-Smith.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. Penrose, president, in the chair.

The Use and Abuse of Marble for Decorative Purposes.

Professor AITCHISON, A.R.A., alluded to the various kinds of stone classed as marble, and referred to the distinctive qualities and beauty of that material. The Greeks seemingly chose it mainly on account of the perfection to which it could be worked and the delicate modelling it would express, and the Italians followed in their footsteps. Coloured and variegated marbles were in high favour among the Romans. Enormous quantities were used by them. The country-house of the Gordiani in one single portico had 200 columns, and in the same villa were three basilicas having 100 columns each. The greater part of the marbles used in the palaces, churches, &c., of the Dark Ages and early Mediæval days were taken from the ancient Roman buildings. In modern times many of the quarries which supplied the ancients have been rediscovered and new ones have been opened. The great drawback to the use of flowered marble for columns that bear weight was its liability to flaws and defects, and the shafts should first be tested by the hydraulic press. With regard to the internal use of marble in England it looked and felt cold in winter, and when buildings were not warmed it condensed the damp. Marbles mainly formed of carbonate of lime were useless externally, as the polish rapidly perished. The use of marble for decoration was to colour harmoniously by means of a particularly beautiful and specially coloured material. The finer flowered sorts had in their colouring every sort of motive and caprice that could astonish and charm. The Professor then described the colours of different marbles and referred to the imperishable coloured decorations to be obtained by inlaying. Monumental colour was as hard to get as monumental form. The safest course was to adhere to one colour, or to some strong contrast of two colours, such as black and white, dark purple and white or dark green and white. Black and white for columns, balustrades and walls had a dignified effect, but the white should greatly predominate, or the effect would be too funereal. If an effect of richness, magnificence, or gorgeousness, or of delicacy or loveliness were required, the same rules held good in marble as in painting. For a white or a light ground, with colour interspersed, the other colours should be very light, or bright colours in small pieces; while for a dark or low-toned ground white or very light tones should be sparingly used. The Professor then laid down certain maxims as to the employment of flowered marbles, and recommended for study in the use of coloured marbles the Pantheon, St. Mark's at Venice, St. Sophia and other buildings, describing the effects there obtained by different schemes of colour treatment. Such use of marble, however, should only be attempted by those who possessed the rare gift of being able to harmonise colours, and had perfected that gift by study, observation and trial. The Professor concluded by referring to a "Vision of Paris," by M. Charles Garnier, and expressing the hope that it might be realised in London.

Mr. William Young, who followed Mr. Aitchison, said that his remarks, based upon his own experience and observation as a working architect, would be confined to the use of marble in interiors. The employment of that material, which had been almost entirely absent in English architecture, had developed enormously in recent years; but the question presented itself, Did we always use it in the best way and in the right place? The true use of marble meant something more than merely lining walls with slabs of that material, set in courses marked off by horizontal and vertical joints after the manner of the marble wall-papers with which the walls of the passage and stairs of every ordinary house used to be covered. In marble as in other materials the architect should follow a certain order and scheme to bring out his design. The labour of the hewer, the sawyer and the polisher revealed the beauties of marble; thought and skill must be added to make it beautiful in architecture. To explain his meaning the author referred to the arrangement of the marbles represented in Mr. Alma-Tadema's

picture *The Roman Bath*. For use in a large way marbles should be few, but well chosen. With three or four different marbles handled by a master there was nothing within the range of architectural art, from simplicity to magnificence, that the architect could not accomplish. In selecting marbles for columns, arches, &c., it was sometimes exceedingly difficult to get the particular type wanted to insure perfect harmony. Instances within the author's own experience were cited. Columns should be constructive, and not planted on for decoration; if possible, they should be monoliths. Square pillars should be solid marble, and not brick cased with marble slabs jointed to imitate solid masonry. The marble on walls, where solid blocks would be useless waste, should be so treated as to show that it was a lining. Ordinary box-marble chimney-pieces, consisting of slabs of marble placed one in front and one on each side, as though to give the appearance of a solid block, the author considered not to be a true use of marble, and not architecture. With regard to the question, Should colour follow form? the author was of opinion that there was much sound truth in Mr. Ruskin's dictum that colour should be visibly independent of form, although in actual work it was found that colour, as a rule, must follow form. There were, however, exceptions. Instances and reasons in support of both views were shown and explained by the author by the aid of photographs of existing buildings, and the conclusion arrived at that a true and intelligent medium should be observed. The author next discussed the question *where* to use marble. If the *where* was wrong, the *how* could never be right. One thing was certain: marble had not been used in the present day where it ought to have been used. Largely employed in clubs and restaurants, in fish-shops and shop-fronts, in our churches marble was conspicuous by its absence. It would be well if modern architects would endeavour to see their work as their successors would see and criticise it with regard to the use of marble. A forecast of such criticism the author would try and put before them by imagining himself at a meeting of architects in the year 2395 to hear a lecture on "The Use, Non-use and Abuse of Marble in the Architecture of England at the End of the Nineteenth Century," in which the hypothetical lecturer deals with the lavish use of marble in palaces, club-houses, mansions, halls of amusement, &c.; its abuse in drinking saloons, &c.; its non-use in Government buildings, where it would appear to have been prohibited by law; and—strange anomaly—its complete absence in the churches of the period, where only dingy brick and plaster were found, and sometimes a cheaper kind of stone sparingly used.

Mr. BRINDLEY (Farmer & Brindley) then read a short paper, being notes he had prepared.

Mr. ALMA-TADEMA proposed a vote of thanks to these gentlemen, which was seconded by Mr. G. Simonds, sculptor, and the hour being late, the proceedings terminated by passing the vote unanimously, which was acknowledged in a few words by Mr. Aitchison.

A NEW RACE IN EGYPT.

ON the 17th inst. a lecture was delivered before the Edinburgh Royal Society by Professor W. M. Flinders Petrie on "A New Race in Egypt."

The Professor began by describing the district which he had been exploring. It was about thirty miles north of Thebes on the western side of the Nile, between two stations known as Negadeh and Ballas. The Nile Valley was a gigantic trench cut through a plateau of limestone. On an examination of the plateau near Thebes, which was 1,400 feet above the present level of the Nile, they found the top of it strewn with the remains of paleolithic man. Hitherto the remains of these flint-workers had only been known in Egypt among the lower gravels. It was, therefore, matter of great interest to find that the top of these great cliffs of limestone were really the home of the paleolithic man at a period when the Nile, swollen by the great rains to which this region had been subjected, rolled in a mighty flood eight or nine miles in width and over 100 feet in depth. Examples of the flints found on the plateau were thrown on the screen by means of the limelight, and were shown to be of the same shapes as were got in the drift in Europe, viz. leaf-shaped and triangular, but whereas those got in the gravel were rounded by the action of water and by rolling, those on the plateau were perfectly untouched and perfect, just as they had left the hand of paleolithic man. Smaller flints were also found of a later period bordering on the neolithic age. That was one point which had been cleared up this year at the place they had been staying. He went to this place because he had seen there the remains of an untouched small Egyptian temple and town—untouched so far as antiquities were concerned. On clearing away the remains he found it had been dedicated to the god Set, the worship of which had been proscribed because the god represented the spirit of evil. In earlier days the Egyptians worshipped the gods Set and Horus, who were

brothers; but latterly, for the reason stated, Horus alone was worshipped. This continued until the eighteenth dynasty, or about 1550 B.C. In this temple was found a sculptured slab with a symbolical representation upon it of the god Set, with the head of some mythological animal giving life to the king. Nothing was found of the late Greek occupation, but the Professor remarked that the finding of this town called Nubt or Ombos explained an obscure passage in the fifteenth Satire of Juvenal. Another town known as Nubt was rendered by the Greeks as Ombos, now Korn Ombo. But it was this recently found Nubt-Ombos which Juvenal refers to in his fifteenth Satire as being next to Tentyra, for Dendera is the nearest city to this on the north. The satirist described the rivalry between the two places, so that the inhabitants of one felt a profound horror for the temples and idols of the other. Beside the classical interest of it, the town was of great value as preserving the remains of many successive ages. At the bottom of it was pottery precisely like that found in northern Egypt of the fourth dynasty. Above it was pottery the same as that of the twelfth dynasty, and above that pottery like that of the eighteenth and nineteenth dynasties in northern sites. Hence there is proof that the varieties of style already traced were not merely local but extended widely over the country. Pictures were shown of vases and various implements which were found under the foundations of the temple, the date of which was referred to the time of Thothmes III., and the Professor gave an interesting statement on the significance of such implements being put into Egyptian tombs and under the foundations of temples. The pottery in question, found in successive layers, he further explained, had been of great importance in another respect, inasmuch as it had enabled them in some degree to confirm their views of dates in ancient Egyptian history, which they were endeavouring to spell out from pottery found in other parts of Egypt. But the strangest result awaited the explorers here. Not a quarter of a mile from this Egyptian town lay another site of a town. In that not one potsherd was like those of any of the periods seen in the Egyptian town. And, *vice versa*, not a single sherd like those in the strange town was to be found in Nubt. The two were "remoter than a star" in all their remains, and if the new town had been found in Syria or Persia no one would have supposed it to be connected with Egypt. Not only was a town found, but also a series of cemeteries of this same new race, and altogether nearly 2,000 graves have been completely excavated, every object noted in position, and everything preserved and marked. To accomplish so much in two or three months fully occupied five explorers. Professor Petrie had with him the Craven Fellow, Mr. Grenfell; the former Mexican explorer, Mr. Price; and an Aberdeen student, Mr. Duncan; while Mr. Quibell was working another part of the district on behalf of the new organisation of the Egyptian Research Account. The result of this thorough exploration was most strange and inexplicable. In this great number of graves not a single Egyptian object was found—not one scarab or cartouche, not one hieroglyph, not one piece of usual funereal furniture, a head-rest or a kohl-pot, not one Egyptian bead, not one god, not one amulet, not a single piece of Egyptian pottery, such as was found abundantly in the neighbouring Egyptian town. And not one body was mummified or buried at full length; all were contracted, with the knees bent up to the arms. The position was always with the head to the south and the face to the west. There were no traces that the bodies were embalmed. The tomb was an open trench with wooden beams, with the earth thrown in over the body, and corresponded in many respects with the graves found by Schliemann in Mycenæ. The extent of this race is shown by their characteristic objects having been found abundantly as far north as Abydos and as far south as Gebelen. This is a district of rather more than a hundred miles in length, opposite to the Great Oasis and the Western Oasis, which would give access to it across the desert from the west. The age of this people was the next problem, and, little by little, fact after fact limited their epoch, until we can definitely say that they were between the seventh and ninth dynasties, or about 3000 B.C.; and they probably were the people who overthrew Egyptian civilisation at the close of the old kingdom, and so produced that dark age of the seventh and eighth dynasties, when the Egyptians seem to have been narrowed and oppressed by disaster. The whole credit of this dating is due to the Egyptian Research Account, as Mr. Quibell fortunately had in his region a mixture of Egyptian tombs of the old kingdom and middle kingdom, along with those of the new race, and the inter-relations of these tombs solved the questions.

The ascertained facts about this new race may now be sketched. Their physiognomy was fine and powerful, without any trace of negro prognathism. Their stature was remarkable, some being over 6 feet high, and the great development of their legs points to their having been a hill race. The skulls were those of a race of people with well-developed heads, capable of great things, with thin hooked nose, high forehead, great

strength of eyebrows, straight teeth and without any trace of the negro about it. The women had long wavy hair of a brown colour, and of it some specimens in a fine state of preservation had been found. From a carved ivory found in one of the tombs they were able to tell that the men wore long pointed beards. The whole appearance corresponded to what Professor Sayce and others had recognised to belong to a Libyan-Amorite type. In the graves were found large numbers of red vases full of the ashes of wood, which had evidently been burned at the funerals. There was no trace, however, that the bodies themselves had been cremated. These ashes, Professor Flinders Petrie said, were evidently the remains of burnings, and he recalled how in the Old Testament it was mentioned that there were "great burnings" at the funerals of some of the Jewish kings, a custom which had evidently been borrowed from their Amorite neighbours. There were scratchings on these vases, but no hieroglyphics. Going on to discuss the date of the remains, Professor Flinders Petrie showed how they must be subsequent to the fourth dynasty. In the sloping passages to the Egyptian tombs of that period they found that graves of the new race had been dug. They must, therefore, come after that first great period of Egyptian civilisation. Above the graves of the new race, again, were found remains of the twelfth dynasty, so that they must place the date of the new race between the fourth and sixth and the eleventh and twelfth dynasties. It was likely that they were contemporaneous with the seventh, eighth and ninth dynasties, and were in all probability invaders—in some ways as civilised as the Egyptians themselves—who had swept into the country, had expelled the Egyptians from these parts, and with them had held no relations or commercial intercourse. They might put the date of this invasion at 3000 B.C. In going on to illustrate on the screen and to describe more minutely the "finds" made in the tombs, the Professor showed pictures of two rudely-carved female figures which, he said, resembled the megalithic figures found in Malta, and which were in his view not Phœnician, as was thought, but belonged to Libyan civilisation. A striking feature in the case of this race was that the head had been severed from the body previous to interment; and sometimes on the top of the vertebrae was placed a dish with the head again set upon that. In one grave where four or five bodies had been interred they found a row of stone vases with a skull and a vase alternating. Another peculiarity was that the bodies had been cut up before death, and the arm and the thigh bones had been broken and the marrow extracted—a strong evidence that if the race was not cannibal they practised ceremonial cannibalism, the custom being to eat some part of the body so that the virtues of the deceased might pass into the living. But we must not for a moment suppose that this implied an ignorance of all civilisation. In many lines—pottery, flint-working, bead-making—these people were the equals or superiors of the Egyptians.

Art and Civilisation.

The arts were well advanced in most ways. But in two directions there was a remarkably low level; no writing was known beyond personal marks, no trace of hieroglyphs is met with, and drawing and sculpture were in a very rude condition. Metal, however, was well known; copper chisels, or rather adzes, show that woodwork was familiar, and traces of finely-carved bed frames with bull's feet were found; copper needles also showed that sewn garments were used; and copper harpoons were imitated from the form in bone. Flint-work was far more highly developed than by the Egyptians; the forms of the knives differ from any of the Egyptian race, and the exquisite machine-like flaking of them shows the highest skill. We now know that the finest examples known—in the Ashmolean and Pitt-Rivers Museums at Oxford—belong to this people. Stone-working was also a favourite art, many beautifully formed vases of all varieties of stone having been found, from the soft alabaster to the hardest syenite. All of these are entirely wrought by hand without any lathe or turning process. Figures of animals and other forms of slates are commonly found, and were used to grind malachite upon by means of brown jasper pebbles. This colour was probably used for painting the eyes, as among the earliest Egyptians. Beads were skilfully made of hard stones, and many were glazed, but the forms were always un-Egyptian. The clear crystal beads with a coloured glazing are now known to belong to this race. In pottery these people excelled. The exquisite colouring of the red vases, showing every shade of crimson, with brilliant black tops, produced by being burnt in the ashes, is more rich than in any Egyptian ware. The forms are varied and often fanciful, but generally graceful and true. And yet every piece was made entirely by hand; the potter's wheel was completely unknown. This shows how great a break had been made from the old arts of the country; for if any of the men of the old kingdom had been retained, even as slaves, the wheel could not have failed to be used among a people so devoted to pottery. Few tombs contained less than half a dozen vases; many had twenty or

thirty, and one even eighty. Some of the pottery was coloured a rich crimson red, which was produced by a hematite glaze; some of the vases had a black band round the lip. Other pieces had a buff body colour with red painted lines. Among the forms the double vase appeared; others were in the form of birds; some of the larger pieces had handles akin to those found on the Amorite pottery of Palestine, and there were ornamental slates upon which, with a burnishing pebble, the people ground malachite to make green paint. This they used for the eyebrows instead of the black paint of the Egyptians. On one of the large vases was a rude representation of a boat, with cabins and oars, from which it was implied that this race knew something of the sea, though this vase, with some others of polished black ware, akin to the black ware of Italy, was evidently not home-made but imported. About 100 stone vases had, in all, been found in different material, all hand-made, and, like the pottery, of graceful form. Their flint implements, it was also pointed out, were of great beauty and delicacy, and copper and bone adzes and harpoons and ivory pendants had been found. The race knew and venerated the dog, for in one of the cemeteries a grave in which seventeen dogs had been buried was found. Summing up, Professor Flinders Petrie said the race evidently did not come from the south, as they had no affinity with the negro, and there was a strong presumption that they did not come from the north into Egypt; for from the fourth dynasty there had been continuous civilisation at Memphis, the capital of the country. They must, therefore, have come from the east or west. The probability was that they came from the west, as the district they occupied was opposite the western oasis, from which any invading race would naturally march eastward. Seeing that the remains had much in common with that of the Amorites in Syria, his hypothesis was that both were of the Libyan race inhabiting the north of Africa, who, about the period of the close of the sixth dynasty, threw off two great branches, one of which found its way into Syria, and the other marching westward subdued this portion of Egypt of which he had been speaking, had destroyed the inhabitants, but had been unable to make their way further north on account of the determined front presented to them from Memphis. But the remains of both the people and their works must be thoroughly studied, and further research made for other settlements of theirs, before positive conclusions can be drawn. Here, at least, we have an entirely new and unsuspected factor in the most important civilisation of the ancient world.

THE SILCHESTER EXCAVATIONS.

THE labours which were undertaken by the Society of Antiquaries at Silchester, and which have now been carried on for five years by Messrs. St. John Hope, Fox, Jones and Stephenson, have during the past season been fruitful of valuable and unexpected results, and it may fairly be said are amassing for us materials for the reconstruction of the history of Great Britain during the Roman occupation. The various objects found and the plans and drawings of the city now in process of reconstruction may be seen at the rooms of the Society of Antiquaries, Burlington House. In previous years the forum and basilica, an ancient temple and what is believed to be a Christian church, an inn, baths, houses of different classes of society, and many interesting artistic remains rewarded the explorers. The plan of the city and the lie of its streets were traced with considerable exactness of detail, and the distribution of the inhabitants and the degree of civilisation and comfort which they had attained could be conjectured from the remains. Last year's excavations, which were begun on April 30 and continued, with an inevitable break for harvesting, until October 18, involved the thorough examination of six and a half acres, including the southern half of Insula IX., the two Insulae X. and XI., and a triangular Insula XII. lying to the north of Insula X., against the city wall. In the four Insulae excavated, with the exception of the irregularly placed house of the corridor type, and possibly of a second south of it, which were referred to in last year's report, only one other house has come to light, which lies on the southern edge of Insula IX. and abuts on the main street of the city. The only important architectural remains are a medium-sized capital and base of a Doric column of good character, which had, in a spirit of vandalism, been used for building material, and a large and fine slab of Purbeck marble. Other objects were, of course, unearthed in metal, bone, glass and iron, including a gold ring of good design and a fine piece of pierced bronze-work, and a number smaller than usual of fragments and whole pieces of pottery, especially of the coarser kinds. Every year brings its small contribution of coins, but last season far outstripped the others, and a hoard was disclosed hidden in a black earthenware vessel in Insula IX., consisting of 253 silver denarii of various dates, from Mark Anthony to Septimius Severus—a range of about 250 years—

and almost every reign was represented by one or more coins. Of these, 48 were retained as treasure trove by the British Museum, and the remainder are to be deposited at the Reading Museum with the other finds from the ancient city. The latest date on any of the coins is one of the earlier years of Severus (193-211 A.D.), from which the approximate date of secession may be conjectured.

But the most important discovery, to which it is believed that archaeological research affords no parallel in these islands, is that of a number of furnaces, obviously of an industrial character and of various sizes, some of them being circular and others oblong. They were found partly within and partly without a series of rectangular enclosures or buildings. Twelve of these buildings have been uncovered, all of the same type, and twenty-one hearths, twelve circular and nine oblong. It is believed that these buildings and their adjuncts were devoted to the dyeing industry, and this conjecture is made probable by the large number of wells discovered, one of which was of peculiar and unusual construction. A plan is exhibited of one of these circular furnaces, and it is found to correspond exactly with a dyeing furnace at Pompeii, of which the sections are shown on the wall. The circular furnace was, there is every reason to believe, used for dyeing. But there are a number of others with a straight flue, which are supposed to have been intended for drying. At Pompeii the climate made drying-rooms unnecessary, and nothing has been found there corresponding with the straight-flued furnaces. There are also traceable a number of rooms which, it is presumed, were intended for the storage of goods and materials, and open spaces with no remains of flues which may have been used for bleaching grounds. It is thought that these furnaces belong to the later period of the city, and the traces of successive occupation lead to the conjecture that the richer inhabitants left the district in which this industry was carried on and migrated eastwards. The theory is strengthened by the discovery *in situ* of a number of querns for hand-grinding the madder roots used for dyeing purposes.

It need hardly be added that an earnest request is made by the committee for funds. The annual expenditure is between 400*l.* and 450*l.*, of which wages absorb about 300*l.* and the rent of the land 35*l.*, whereas the subscriptions scarcely exceed 300*l.*, and the fund is in debt to its treasurer, Mr. F. G. Hilton Price. In the coming year two more Insulæ—XIII. and XIV., adjoining the west gate, south of the main street—will be attacked, as they are known to contain interesting remains, and it is also hoped that Insulæ V. and VI., underlying the pasture east of the forum, may be taken in hand. Altogether, about forty out of the hundred acres within the walls have been excavated, and the committee anticipate that, at the present rate of progress, several more years' work will have to be done before all the treasures and knowledge buried in the soil have been revealed. It is to be hoped that the claims of our own country may not be forgotten in the enthusiasm about the perhaps more brilliant, but not more instructive or valuable, discoveries in Egypt or the Levant.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

BEGINNING PRACTICE IN THE THIRTIES.

THE difficulties which await young architects at the beginning of their professional careers are not the creations of our time. A paper which appeared in 1834 reveals that when there were few competitors for practice it was no less difficult to secure clients. The style of the writer may be old-fashioned, but what he says was evidently derived from experience:—

To what base uses we may return!

The sketches of a travelling architect are far more likely to exhibit the poetry of his art than those of an architect in practice; at least in these days of penny wisdom, when a man had rather forfeit all the acknowledged rules of proportion between solid and void than pay the tax upon a sufficiency of windows of sufficient size. Only consider for a moment the early career of a young architect of aspiring mind and lively imagination. He has hitherto been employed first as an office student and afterwards in the pleasing occupation of a tour through all the brighter scenes of classic celebrity. Having studied at home the volumes of Palladio, Wilkins's "Magna Græcia," Stuart's "Athens" and Denon's "Egypt," he hurries away on wings of eager expectancy, tangibly to enjoy communion with those revered objects whose essentials of beauty and proportion have been already made known to him through the media of description, and the graver Italy opens to him her rich treasure

of miscellaneous art; Sicily points proudly to Agrigentum; he weeps at the sight of the Athenian Acropolis, and, on entering the sepulchral cell of Theseus, exclaims,

If it were now to die
'Twere now to be most happy!

forgetting at the moment that he has yet to wander with the Nile amid the astounding ruins of mighty Thebes. He now contemplates the massive splendours of Latopolis and Tentyra; swells with honest pride at the evidences of man's intelligent power as afforded by the Propylea of Edfow, Luxor, and Philæ, teems with a still increasing spirit of emulation, and paraphrases the vengeful proclamation of Lear:—

Aye, ye proud monuments,
I will afford such rivals to you all,
That all the world shall—I will do such things—
What they are, yet I know not; but they *shall* be
The wonders of the earth.

He returns home—to the scene of his future practice, or, at least, of his future hopes. Not so unreasonable as to expect immediate employment, he is content for a time to "build castles in the air;" that is, to suspend his professional imaginings in the atmosphere of the exhibition at the Royal Academy. It is true his designs for "royal palaces," "triumphal entrances," "national mausoleums" and "senate houses" (if admitted into the exhibition-room) gain him but little credit; and it is, perhaps, with some degree of chagrin that he sees the great mass of the spectators pass over his 40 square feet of pictured paper as they would over the variegated surface of a Turkey carpet; but still, people may not understand drawings, they have yet to see his designs in palpable material, shadowed and coloured by nature. Then shall they rightly judge, and in this consideration he forgives that present want of sagacity which regards as insipid the architectural room, and pounces with "lynx-eyed" fervour upon the cabinet of miniatures. Besides, his productions are addressed to the intelligent few, whose report will in reasonable time have a due effect upon the many, and bring him honour and employment. With this "few" it is not his good fortune to meet, though pretty constant in his attendance, hoping personally to experience the sweets of unprejudiced approval. Still, he cannot be always there, and it is therefore a freak of fortune that all the good things uttered of him are spoken behind his back. This, according to Shakespeare, only makes them "of more price." His talents are, no doubt, appreciated, while his modesty remains free from offence. This is delightful. When professional power and philosophical acumen are thus united happy indeed is the mind in which they conjointly act.

My hero is now established in an office. The brass-plate on his door announces his vocation, and name, street and number being advertised in the Academy catalogue, he hourly expects a call from some fascinated man of judgment, who may safely conclude that the author of a "royal palace," "triumphal entrance," "national mausoleum" and "senate house" must needs be more than competent to the erection of a country mansion or chapel-of-ease. Thus, as you will perceive, gentle reader, he is not unreasonable in his expectations as a young practitioner. He knows that commissions of hundred thousand pounds value are not "plentiful as blackberries," but that gentlemen are constantly building mansions, and that chapels-of-ease are in unprecedented request. He therefore prepares a series of sample designs, including all the varieties of the horizontal Greek and perpendicular Gothic. Doric porticoes, Ionic vestibules and Corinthian drawing-rooms are placed in striking contrast with Saxon porches, florid altar-pieces and crocketed spires; plans, sections and elevations strew his side-table, and the riches of his travel glow resplendently from his walls. Hush—a step—knock, knock. The twopenny postman. A letter from—his mother. "My dear Son,—Your father and I have just seen our friend, Mr. Fullmoney. We told him of your progress as a student and of your promptitude for practice. He has not yet seen your drawings in the exhibition, but he expresses a desire to see you, as he thinks of giving you a job. We have heard of his intention to build, and the supposition that he will do so is most reasonable, since he has lately given fifty thousand pounds for a fine estate on which there is nothing but a shabby old farmhouse, and we know his intention to reside on the property. Lose no time in calling upon him. Show him your drawings and your journal, and talk to him about all those wonderful things which may give him pleasure, but which are somewhat above the comprehension of your poor dear father and your ever affectionate mother,

SARAH SONPROUD."

To be sure 'tis not pleasant for a man who has traversed Italy, ascended the Acropolis, and marched in state among the wonders of Nubia, to sit waiting half an hour in the cold, on the polished oak bottom of an old citizen's hall chair. The powdered footman might have asked him to walk into some unoccupied parlour, with a fire and newspaper to prevent shivers and tedium. However, he'll catch it when his master knows whom he has abandoned to the exclusive contemplation

of hat-pegs and oil-cloth. Yet he sent in his name—a name well known to the proud cit. By the marbles of Pentelicus, but this is wondrous strange.

He is at length summoned into the library, when old Fullmoney throws balm on his hurt mind by hoping he has “not waited long,” by fearing he must have “found it cold,” and by telling him finally he is “happy to see him.”

“Well, sir, your parents speak wonders of you. You have recently returned from your travels? and which do you like best, England or France?”

“Why really, sir, I know little of France, the mere entrance-lodge to the vast domain of continental art. Besides, sir, it was not my part to cultivate any partiality for soil or climate, people or their laws and customs. My sole motive, sir, was the attainment of professional erudition, and in Italy —”

“Oh, you’ve been to [stirring the fire] Italy, have ye?”

“Yes, sir, and thence through Sicily and Greece.”

“Greece, too, have ye?” [Ringing the bell.]

“Yes, sir, and thence to Egypt.”

“John, more coals.—To where, sir?”

“Egypt, sir.”

“Indeed. Did ye see any crocodiles?”

“Why, sir, they are frequently to be seen, but I was so taken up with inspecting the numerous temples.”

“Aye, in search of mummies, I suppose. Curious mummies those at Bullock’s Museum, eh? What have you there?”

“A few of my drawings, sir, made upon the spot, and laid down to actual measurement. This, sir, exhibits a restored elevation of the portico of the Parthenon.”

“Aye, just like the front of the India House. Very pretty. What’s this?”

“The Pantheon, sir.”

“It looks to me like the Coliseum, as they call it, in the Regent’s Park—very pretty. What’s this?”

“The Lantern of Demosthenes.”

“A lantern, eh? It’s like a spice-box. Where did they put the candles? Very pretty. What this—a turnpike lodge?”

“No, sir; the Temple of the Winds.”

“Indeed! well, it does somewhat resemble a chimney-pot. What’s that, standing all alone there in the fields?”

“The Temple of Theseus.”

“’Twould make a pretty cowshed. Well, sir, I must look at the remainder another day; and now to business.”

The feelings of the young architect during the foregoing colloquy can be fully understood by those few alone who professionally, or as amateurs, have studied ornamental architecture in its details. They who entertain any feeling for the art in a general sense would, of course, be sufficiently disgusted; but to the young professor, who reveres the smallest moulding in the least important example of antiquity, such a laceration of forms adored must prove no less than ghastly. However, the prospect of a job aids the endurance of the offence; and there is further comfort in considering that the new country mansion will address itself, not merely to the eyes of the ignorant Fullmoney, but to the informed beholding of his visitors and the passing stranger. What a portico will he have! What a vestibule and staircase! How choice and appropriate shall be the decorations! How massive and firm the construction!

The patron thus develops his purpose to the expectant professor:—“Now, sir, you have possibly heard of my having lately purchased an estate near ——. The park is most beautiful, rich in noble timber and commanding in situation. Everything in short is admirable except the house, which is indeed a mere remnant of the old mansion, and has been for some years back occupied by a farmer. Here is a plan of it, taken by my carpenter. You see, sir, how extremely inconvenient it is in almost every respect. The dining-room too small; the other a passage-room. Then, sir, it’s very much out of repair. There’s no closet of one particular sort (you understand me, sir) and too many of the other sort. In short, sir, after considering the matter over and over again, and taking the advice of a friend, I have come to the determination of ——. What d’ye want, John? Excuse me, sir, for a moment while I exchange a few words with my solicitor.”

During the patron’s absence our young professor fills up in his imagination that blank in the conclusion of Fullmoney’s address occasioned by the footman’s message. “Yes, sir,” thinks he to himself, “you have come to the determination of pulling it all down, and of building a new mansion, suited to the beautiful park you have so justly extolled. You have come to the determination of mistrusting your own judgment on matters of taste and of trusting to me for the provision of a good and handsome residence, with all the appendages and superior conveniences, the character and beauty, that should distinguish the man of fortune, and preside among a park of oaks. You have come to the determination of —”

At this moment re-enters the patron:—

“Well, sir, as I was saying, I have come to the determination of putting the whole in habitable repair, and of making one or two little alterations, which will, in effect, prove to be very great improvements. Now, sir, these are my ideas on the subject. First, knock down the end of that useless closet, so as to make a way from the dining-room to the kitchen without going through the drawing-room. Secondly, knock a hole through the stone wall at the end of the dining-room, and put a thin partition flush with the outer face, by which we may get a recess for my sideboard, and thus virtually enlarge the apartment. Thirdly, poke a little window into the outer wall of this closet upstairs, and fit it up as the required convenience to which I have before alluded. Fourthly, put the entire house into repair and give the old work two coats, and the new work four coats of common oil paint.”

Spirits of Memnon, Ictinus and Phæax, shades of Vitruvius, Buonarrotti and Wykeham, hover around me in merciful protection, or rather give me the benefit of your wings and bear me up and away, where even

the birds dare not build,

Nor insect’s wing flit o’er the herbless granite.

Are we then after a course of mighty preparation for emulating the gigantic splendours of ancient art; are we then (fraught with a swelling ambition which o’erflows our continent of modesty); are we, most placid Lady Patience, to be subject to the climax of being smothered in the destruction of a lath and plaster partition? or employed partly to amend, but chiefly to perpetuate the clumsy blunders of an ignorant country carpenter? “Base,” indeed.

II.

AUSTRIA. — I must pocket up these wrongs,

Because —

BASTARD. Your breeches best may carry them. — KING JOHN.

Yes, though loss of patience may be sufficiently troublesome, still more so, as John says (not Plantagenet, but Gilpin), would be the “loss of pence;” and, therefore, full money must be borne with. I should, perhaps, have concluded my last by saying that the old gentleman dismissed me with a most gracious promise that he would “drive me out some day in his gig” to see his estate, and to confer upon the spot touching the important alterations he had in contemplation.

“And,” said a quiet worldly experienced friend of mine, “you really must come down from your high imaginative flights, and consent to labour for a time in the trenches of your fortune’s edifice, remembering that there is often a close analogy between the progress of moral and of physical things. Thus, to address your professional understanding, I might render some useful directions for the establishment of an architectural practice, by a parody on the specification you would afford for the proper erection of a patron’s house.”

Digger, &c.

To dig out and wheel away all loose notions of self importance down to the solid of your understanding, and to blast (not by profane but by legitimate explosion) whatever rocks of prejudice may rise against you in the mind of your would-be employers. Excavate for and form drains to carry off the superfluities of your youthful imagination, and leave ample space for the footings of your existence on the basis of public opinion.

Mason.

Foundations of your substructure to be formed of plain sound evidences from the quarry of practical knowledge, firmly bedded in the advice of more experienced information, and grouted every third course with a sufficiency of penetrating supervision. Carry up the walls of your superstructure to such an altitude as the solidity of your basement will allow, so that no settlements in the former shall betray the insufficiency of the latter. Wherever the strength of solidity is to be interfered with by the open work of fancy, turn inverted arches of provisional and precautionary care. Construct all flues round the circular cores of upward purpose, so that any occasional fire in your patron’s temper may be carried off in smoke. The whole of the masonry to be laid in mortar well compounded of one-third good intentions and two-thirds executive power. The outside face of all walls to be cemented with a pervading expression of cheerfulness, which if all preceding directions be observed, will not belie the facts concealed.

Carpenter and Joiner.

Roof to be framed with king and queen posts; staunch principles (principal rafters), and a binding beam, that may serve at once to render firm the body of the building, while it forms a part of its protective covering. The whole to be strongly bolted together with well-tempered determinations, so that the slating which is to cover the whole may be adequately supported in its opposition to the winds and the rains of fortune’s tempests. Partitions of sufficient scantling to show the existence and distinct importance of

the numerous departments of architectural science. Floors of competent strength to bear the pressure of your knowledge in each department. Decorative joinery and necessary fittings as may be admissible or requisite throughout the building, to evince your coexistent feeling for the elegant and the useful, with a due supply of locks, bolts and bars, to prevent the inroads of dishonesty or impertinent curiosity.

Plumber, Painter and Glazier.

Provide and fix all required pipes of a sufficient bore to prevent the stagnation or settlement of "fortune's rain" as aforesaid, and turn as much of it as possible into a benefit, by collecting the same into a well-lined cistern, whence it may be again transferred into various departments of home service. Paint the whole of your joinery, &c., in true and honest colours, and varnish the same with a view to poetical fascination—not immoral deceit. Glaze the whole of your lights with the best crown glass, so that your loyalty may remain unobstructed, your domestic comfort preserved and your professional prospects undimmed.

Slater.

Cover the whole of the roofs with sound lady slates, nailed on good heart laths, and, secure in its strength, enter into the mansion which your integrity has built for you.

Thus ended my friend's "specification and particulars of sundry works to be done in the erection and completion of an architect's professional fame;" and as he gave it to me, then an incipient, so do I bequeath it to others, with a ready allowance as to the ease of drawing up a code of good advice and the difficulty of following up the contract. How came Portia to be so architectural in her moralisings? "If to——"

But the glorious Shakespeare suits every argument with fitting illustrations; nor could architecture be better employed than in designing such an edifice as in its erection would show how deep was our love for his moral excellence and how lofty our admiration for his transcendent powers as a creator of airy beings and as a painter of mortal life. Mercy upon us, what an antipodean transition! From Old Fullmoney to William Shakespeare! Let me look back at my text:—

AUSTRIA. "—— I must pocket up these wrongs,
Because ——"

BASTARD. "—— Your breeches best may carry them."
—KING JOHN.

And the young aspirant to architectural practice, who is also obliged by circumstances to look after the garniture of his pocket, will meet with "wrong" enough to inflame his pride. Not, however, that any wanton wrongs will, of course, afflict him—though, indeed, it were well he should be prepared even for these—for the architect comes into more decided collision with the vulgar many (I do not speak of the poorer and more uneducated classes) than any other follower of the fine arts. It argues not any invidious and vituperative spirit in individuals to say that he is to be bullied by committees, ridiculed by the press, and censured even by men of taste. The first will destroy the original simplicity of his plans, the second will laugh at him for not maintaining it, and the third (ignorant of all preventive and compulsory circumstances) will find him guilty of professional error wherever he has been goaded into sorrowing obedience. The history of Sir Christopher Wren is a sufficient evidence to all this. Few of us, however, can suffer wrongs so perplexing as his, for few can pretend to talents so meriting universal admiration, to disinterested zeal so deserving of reward, to moral worth so eloquent in appeals to our love. See his life as detailed in the "Library of Useful Knowledge," that you may the more immediately estimate the caution, "put not your trust in princes."

Again, I must declare against any accusation of bitterness on my part or of wanton unkindness on the part of patronage. It is merely a duty to warn the heedless aspirant of those "man-traps and spring-guns" which Queen Mab and mischievous Puck have set in the "premises" of architectural practice. The times may come when he will have less to fear, when sympathy shall be pervading and good taste general; but if human nature be "not critical" she is "nothing." Let each man in his individual calling do his best to enlighten the public so as to render it critically just in its feelings and expressions; but let him also during the work of reformation quietly "pocket those wrongs which his breeches best may carry."

The Class for Architectural Modelling at the Royal Academy Architectural School has terminated for the session, and a series of eight demonstrations will be given by Mr. Stannus each Thursday evening, from six to eight, commencing May 2, on sub-panelling and ceiling-design.

ARCHITECTURE IN COLOMBIA.

IN no place in the world has Spain so elaborately lavished its knowledge of architecture, writes Mr. Caracristie in *Stone*, as it did in Colombia in colonial days, before the great Bolivar unyoked the people from the plough of tyranny. But however great may have been their adornments of churches and convents they have never reached the height of architectural perfection to which the Chibchas nation rose in the early part of the Christian era. Those Indians who occupied the savannah of Bogota, a great tableland, nearly sixty miles long and fourteen wide, rose to the greatest height of civilisation—a civilisation perhaps higher than that of the Incas of Peru and the Aztecs of Mexico. So wonderful and complete was their temple, so vast in extent were the buildings by which it was surrounded, that when the Spanish conquerors arrived and beheld it they were dazed with stupefaction. The spirit of vandalism of Spain was never so fully manifested as when the ignominious torch touched the altar of this edifice. The fire that followed is said to have lasted three months, and in the words of an Indian of this country, "the roar of the tiger ceased not during this period and the condors slept not; neither did the sun shine upon the lands of the Chibchas; for their god was about and swore the downfall of Spain." The spoils from this edifice, in gold alone, amounted to a heap so high that two horsemen riding around it could not see each other.

The very soil on which I am writing this moment was the site of this temple, and the cathedral of Santa Fe, which is just before me, is partly built of its ruins. Bogota has many historical associations, and while we might go from New York to China in a shorter time than it takes to come to Bogota, yet in the early days of the conquerors Colombia took a great part in the theatre of wars which swept South America from ocean to ocean; and it has to-day the spirit of progressive enlightenment which shall make it one of the great nations of our western hemisphere.

The great facility and ease with which stone may be quarried in the neighbourhood would make its use very cheap were it not for the want of roads and transportation; yet many houses are built of a light buff sandstone which is easily worked, durable and cheap. In fact the whole of Colombia abounds in beautiful buildings and ornamental stones, especially marbles of the finest kind; but these latter have not yet been worked, although a company has lately been organised in Bogota to work some deposits which are said to exist near the city, and which I shall examine in a few days.

This abundance of building stone to which I refer has made it possible for the Spaniards to build beautiful churches which have withstood the power of the elements and time.

The greatest piece of stonework on the American continent is the "great wall" of Cartagena which surrounds the whole city, and is so wide that twelve men can ride side by side on it. These walls, constructed of a porous limestone resembling coral, were built by the celebrated engineer Arebalo at a cost of 56,000,000 dols. The labourers employed were Indians, who were so ill-treated that often when caught in their native fastnesses and brought to Cartagena they killed themselves rather than submit to the harshness of slavery. About a mile from these walls was built one of the prettiest forts in the world at a cost of 10,000,000 dols. This was known as "San Felipe," and nothing remains of this building but a picturesque heap of ruins. Between this fort and the cathedral of Cartagena is a subterranean passage which goes under the sea a distance of three-quarters of a mile. This is now so filled with bats, snakes and debris that I found it impossible to descend into it to any distance.

Among the beautiful structures of South America may be named the church of San Juan de Dios, in Cartagena.

The buildings of Barranquilla are more modern and offer nothing for the student of architecture, while the cathedral of the city of "La Cienaga" is very picturesque and ancient. Strange as it may seem it is the only building in the city which one would care to look at.

Santa Marta, the ancient rival of Cartagena, but now only noted for the splendid varieties of bananas which are produced in the surrounding country, also offers much valuable material for the student of ancient architecture.

Medelline and the other cities of interior Colombia offer but very little of interest, while Panama has among its ruins some beautiful pieces of work.

Bogota is a beautiful city, and while it lies amidst the luxurious splendour of equatorial America, its altitude above the sea-level (8,500 feet) gives it a climate of perpetual spring. Among its wonderful structures may be mentioned "La Capilla del Lagrario," which contains an altar 35 feet high by 20 feet wide at its base, all of which is built of polished turtle-shell and inlaid with mother of pearl. This building is finished in the interior with ebony, mahogany, rosewood and other woods equally as rare and beautiful. The ceiling is gilded and carved, and presents an appearance of richness seldom seen in any

other part of the world. The cathedral, too, is a wonderful stone structure with the interior richly adorned with the most wonderful works of modern and ancient times. A Virgin that is found in this edifice has besides gold, rubies and emeralds, &c., over 700 rare and pure diamonds. Its value is unknown and it is in itself one of the most wonderful works of the world.

The great San Franciscan convent, Bogota, too, is one of the wonders of South America. The altar which is found in it is a work of magnificent art and is truly worthy of special note.

In the town of Monqui is a beautiful church and convent built by the Spaniards, which contains a celebrated picture of the Virgin of the Rosario painted by the Emperor Charles V.

From an architectural point we have much to learn from the ancients, and a collection of Colombian buildings would do honour to any of our cities of the United States.

PERSIAN TILES.

A **SPLENDID** Persian section has been steadily growing in the Edinburgh Museum of Science and Art under the fostering care of General Sir Murdoch Smith, whose long connection with this interesting Oriental country is, says the *Scotsman*, a guarantee for the excellence of the exhibits from it which find their way into the museum. It is of especial importance to all interested in decoration, whether in connection with the art of the jeweller and silversmith, the potter, the maker of carpets and curtains, or the decorative printing of paper or textile fabrics. One group of exhibits in this new section consists of examples of the old lustre ware of Persia dating from the eleventh century, later work about the sixteenth century, and of present-day pottery in the shape of decorative tiles of various descriptions and for different purposes. The craftsman whose name is attached to this last-mentioned group is that of Ali Mahomed, a potter who was known to General Sir Murdoch Smith in Ispahan, but who is now located in the capital, Teheran. They are not equal in beauty to the older work, but they are exceedingly good, and show that the feeling for art is by no means extinct among the craftsmen of Persia. Half a dozen large tiles for the sides of a fireplace have just been placed on exhibition, and it is to refer to them more particularly that this paragraph is written. In the end of last year a gentleman interested in all artistic matters in the city was in the museum with the director, and was greatly struck with the excellence of the modern Persian tiles. He inquired about the artist, and was informed that he was a craftsman of Teheran. "Could such tiles still be had?" "Yes," the director thought, "they could if Ali Mahomed was still alive." It appeared on inquiry that this craftsman was still at work in the capital of Persia, and an order was placed with him for tiles to line the sides of a fireplace. Only the sizes were given; all the rest was left to the artist. The tiles reached Edinburgh the other day intact—a marvellous thing in its way, when it is stated that they had to be brought from Teheran 800 miles on the back of mules over the most wretched mountain roads to Bushire on the Persian Gulf, where they were shipped. The designs represent *al fresco* scenes, and the colours approximate to those of the old tiles, the rich blue of the country being the basis, with greens and yellows in various tints for the details. In one there is a festive scene which might be taken from the "Decameron;" in others there are representations of the chase. The figures worked in relief are daintily and spiritedly drawn, and a fine decorative spirit pervades the whole treatment of the designs. The prices at which these tiles can be obtained seem most moderate, and suggest an excellent field for an enterprising syndicate opening a trade direct between Edinburgh and Teheran. The tiles which have just been described will be removed in a few weeks to adorn the fireplace of a billiard-room in a country mansion in the north of Scotland.

SCHOOL BUILDINGS.

Edinburgh.—A new Board school has been opened at Brunsfield. The entire building is heated by steam pipes, and is ventilated by mechanical means. A Blackman air-propeller, driven by a steam-engine, extracts the vitiated air from the various classrooms. The school, designed by Mr. Robert Wilson, the Board's architect, is in style an adaptation of French Renaissance. The front elevation, about 158 feet in length, is relieved at each end by two projecting gables. In the upper part of these gables are semicircular panels, on which are carved the Scottish arms and the city arms. In the lower part of these gables are pieces of sculpture, the one representing elementary education and the other technical education. From the centre of the roof there rises an ornamental *flèche*, in which is hung the large bell. The total cost of the school buildings is expected to be 27,300*l.*, which is not considered excessive considering the size of the school and the

complete way in which it has been equipped. The contractors for the different works were Messrs. Kinnear, Moodie & Co., and the heating and ventilation have been carried out by Messrs. Mackenzie & Moncur.

Uldale.—A new National school has just been opened. It is built of red freestone dressings from Aspatria quarries, mixed with a lighter-coloured sandstone from a local quarry, the effect of the blending of the two shades of colour being lightsome and pleasing to the eye. The main schoolroom is 37 feet by 20 feet, and provides accommodation for eighty scholars, mixed—a good many more, it is said, than there are at present in the parish. All the windows are fitted with Leggott's patent fasteners. The floor is of wooden blocks, the walls inside are cemented, and the ventilation is on the Boyle's Climax system. The building is slated with the best Buttermere slates with red Staffordshire ridges. There is ample playground to the rear of the school, the boys and girls' playground being separated by a wall about 6 feet high. The contractor for the whole of the work was Mr. J. H. Routledge, Mealsgate. Mr. A. W. Johnston, English Street, Carlisle, was the architect.

NEW BUILDING.

Balmoral Hotel, Edinburgh.—Extensive additions and alterations have recently been made at this building, consisting of a very fine new dining-room, 55 by 53 feet, assembly or dining-room, 58 by 27 feet, writing-room, thirty visitors' and ten servants' bedrooms, lavatories, remodelled kitchen and serving rooms, new American "Otis" elevator, remodelled bar and restaurant, &c. The work has cost over 9,000*l.*, and has been carried out by Mr. J. Macintyre Henry, architect, Edinburgh.

CHURCH BUILDING AND RESTORATION.

Arbroath.—The memorial-stone of the restored parish church of Arbroath has been laid. The old church was accidentally burned down in November, 1892, and is now being restored from plans by Mr. J. J. Burnet, A.R.S.A., Glasgow.

Morecambe.—The foundation-stone of a new Roman Catholic church has just been laid. The church has been designed by Messrs. Pugin & Pugin, of Westminster, and will consist of a chancel, nave and an aisle on the left side. Accommodation will be provided for between 200 and 300 persons, at an estimated cost of 3,000*l.* The contractor is Mr. Charles Walker, of Preston.

GENERAL.

Mr. Henry Moore's picture, *Hove-to for a Pilot*, has been voted the best seascape in the exhibition of the Glasgow Institute of Fine Arts.

Mr. J. W. B. Rooke, C.E., has been appointed surveyor to the Swaffham Rural District Council out of forty-two applicants.

The **Committee** of the Church Building Society have sanctioned the appointment of Mr. R. Norman Shaw, R.A., as president of the committee of honorary consulting architects, in the place of Mr. Ewan Christian, deceased, and two vacancies on that committee are to be filled up by Mr. T. Graham Jackson, A.R.A., and Mr. C. H. M. Mileham.

The **Annual General Meeting** of the members of the Art Union of London was held on Tuesday. The first prize was won by Mr. R. J. Fentiman, and one of 50*l.* by Mr. H. E. Johnson. Forty additional prizes were awarded, one a bronze statuette of *The Warrior*, and the others ranging in money value from 10*l.* to 35*l.* South Australia, New Zealand, Canada, Germany and New South Wales were all represented in the prize list.

The **Ordinary Meetings** of the Institution of Civil Engineers during the present session will not be held, owing to rebuilding of the premises. For the special meeting on May 2 and the annual general meeting on May 28, the Royal United Service Institution will be used.

Mr. Charles Dyall, curator of the Walker Art Gallery, Liverpool, has issued his report to the arts committee on a visit of the deputation to the London studios. He says the deputation found much that was gratifying, especially the cordiality of their welcome and the ready response to their invitations. They also found that the reputation of the Liverpool exhibition was in no way diminished, but that the Walker Art Gallery was regarded as an important factor in the art interests of the country.

The Architect.

THE WEEK.

THE decision which was given by Mr. Justice DAY and Mr. Justice WRIGHT on Wednesday in the appeal case *LAVY & UPJOHN v. London County Council*, is important. The appellants are the owners of one of those houses in the City Road which still have forecourts; in their case it was about 38 feet in depth. It was separated from the roadway by a low brick wall and iron railing. The owners endeavoured to obtain permission to build upon their forecourt, but the County Council refused. A hoarding was then erected for advertisements, but on the demand of the Council it had to be removed. The low wall, which was not more than 2 feet or 3 feet in height, was replaced by another 11 feet high. It was considered as an erection beyond the general line of buildings in the street, and which required the consent of the Council. After a summons was taken out the superintending architect decided that the line of building corresponded with the front of the house. When the owners, after adjournments, came before the magistrate, he ordered the demolition of the new wall as a structure in front of the general building line which was erected in spite of the County Council. It was contended that the magisterial judgment was irregular, as there was no decision of the architect to go upon. The appeal was, however, dismissed. It was considered that as before the case was heard by the magistrate the architect's decision was approved by the appellate tribunal, it was a final decision. But that point in the opinion of their lordships was immaterial. As to the contention that the wall was not a structure, their lordships held that it must be a building, structure or erection, and the appeal was accordingly dismissed.

THE consequences of the failure of the Bouzey embankment are so calamitous, they should arouse water companies and municipal authorities who have charge of water-supplies from that excessive confidence in the superiority of English construction which may lead to danger. A special examination of every large impounding reservoir should at once be made by an independent specialist. We have unfortunately evidence enough that we do not enjoy an immunity from danger. The bursting of the Dale Dyke reservoir, by which about three hundred lives were lost, should be enough to convince responsible parties without further corroboration. When dams are torn asunder, or are made to slide, the district must be desolate in which the loss of life is not appalling. The failure of the reservoir at Johnstown, in the United States, was the cause of the sacrifice of 9,000 lives. In a district that would be closely populated the loss would be greater. The dam at Bouzey, which collapsed on Saturday morning, was not an old work, for it was not finished until 1884. It was strengthened in 1888-89. Unlike some English examples, it was a masonry dam. The foundations were sunk to about 30 feet below the bottom of the reservoir, and rested on firm rock. There were, it is said, no indications of its weakness—at least since 1890. But it is not unlikely that the additions for strengthening the dam did not form a homogeneous mass, and a very slight opening to admit water sooner or later will bring ruin. While the French sufferers merit the sympathy of the world, their fate should compel people in other countries to ascertain whether their reservoirs are secure.

In the form of contracts for new schools and enlargements ordered by the London School Board there is the following clause:—"The contractor shall furnish each week to the architect a statement in writing showing the work and materials executed and supplied since the date of the preceding statement, if any, in respect of which the contractor may hereunder be entitled to payment as extras, and the price charged for every part of such work or material, and in the case of work to be paid for at cost price together with 10 per cent. on such cost price, such statement shall be accompanied with or shall be supplemented by such vouchers as the architect may require. And no work or materials otherwise chargeable as extras which shall be omitted from the weekly statement furnished

next after its execution or supply, or in respect of which no statement shall be rendered for the space of eight days next after its execution or supply, shall be paid for as extras by the Board." The works committee of the Board are of opinion that in the case of variations on the contract the architect of the Board should have the power to decide whether such variations should be allowed as day-work or measured up and valued at the rates in the priced bill of quantities. They accordingly recommend that the following words be added to the above clause:—"In the case of variations where day-sheets are rendered by the contractor and signed by the clerk of works, it shall be within the discretion of the architect to decide whether these works shall be allowed as day-work or measured and valued at the rates in the priced bill of quantities deposited by the contractor as provided for in clause 15."

THE following recommendations by Messrs. OSWALD & HANSOM on drawings submitted for prizes offered by the Northern Architectural Association are worth the consideration of committees of similar societies:—"We think that in future the Association should give more definite instructions as to the size and character of the drawings to be submitted. The size of sheets need not, we think, exceed half a sheet of double elephant paper. Sketches, whether in pencil, ink, or colour, should be submitted as finished on the spot, without being touched up afterwards; and should be of distinctly architectural, not merely picturesque, subjects. Measured drawings should be accompanied by the rough sketches and notes made on the spot from which they are compiled. The importance of plotting dimensions on the spot, including joints, cannot be overrated. It is practically impossible to achieve accuracy in any other way. Work of this kind should never be hurried over, and the finished drawings should show the very best draughtsmanship the competitor is capable of, preferably without shadow lines. As to the sketches, it may help the young draughtsman if we point out as models for his guidance the sketches of the late GEORGE EDMUND STREET, R.A., which were probably as fine and as practical as any ever made, virile in style, and free from all picturesque trickery."

THE annual meeting of the Iron and Steel Institute will be held on Thursday and Friday in next week, at the house of the Society of Arts. Mr. DAVID DALE will preside. One important function will be the presentation of the Bessemer Gold Medal to Mr. HOWE, of Boston, U.S.A. He will read a paper on "The Hardening of Steel." Among the other papers to be read will be the following:—"On the Manufacture of Steel Projectiles in Russia," by Mr. SERGIUS KERN; "On Metal-mixers as used at the Works of the North-Eastern Steel Company," by Mr. ARTHUR COOPER; "On Tests of Cast-iron," by Mr. W. J. KEEP; "On the Iron-ore Mines of Elba," by Mr. H. SCOTT; and "On the Effect of Arsenic upon Steel," by Mr. J. E. STEAD.

IN America the Southern Chapter of Architects, at the last convention, adopted the following resolutions:—"Whereas, the architect is in effect the trustee or agent of his client, and in that capacity shall endeavour to serve the client to the best of his ability, and to secure for him (the client) the full value received of the work under his charge; and whereas, it has been suggested to this convention that some material men have been tendering to architects commissions to secure the sale of their materials, the acceptance of which is contrary to our code of professional ethics; therefore, be it resolved that we, the Southern Chapter of Architects, condemn such methods as dishonourable and to be discouraged by all legal and honourable means. We further consider all material men, and others, resorting to such methods, as unworthy to hold business relations with members of this Chapter. Resolved, that after the board of directors shall have received sufficient proof of such practices or attempts, it shall notify the secretary, giving him the names of the parties transgressing, which names the secretary shall thereupon transmit to each member of this Chapter. Be it further resolved, that these resolutions be published, printed and distributed for the general information of material men, architects and the public at large."

ARCHITECTURE AT THE ROYAL ACADEMY—I.

THE 200 drawings which are hung in the architectural room this year represent fairly well the condition of business. The majority are dwelling-houses. In a builder's eyes the most important work on the walls is the design for Christ's Hospital Schools at Horsham, by Messrs. ASTON WEBB & E. INGRESS BELL, but as the works are not yet started it cannot be considered as an actuality. Public, that is, Government buildings, are absent, and the only costly municipal building which appears is the Darlington Town Hall, by Messrs. CLARK & MOSCROP. The design by Mr. W. H. BEATTIE for the new hotel and offices of the North British Railway Company in Edinburgh must have been very welcome to the Academic hangers, for it at least suggests the expenditure of a great sum of money. The drawings of churches do not betoken a very large outlay. In spite of the drawbacks which are imposed by economy, the collection is interesting, and if a few of the ordinary visitors to the Academy could be induced to visit the room, which is not likely, they would see much to attract them, for after all Domestic architecture appeals most strongly to the popular mind.

Among the houses there is as yet not much show of novelty. Mr. R. NORMAN SHAW has again appeared, but the Hallams, Surrey, resembles houses which he designed several years ago. He gives no sign of inaugurating a new era. The collection begins with a Design for a Town House, in Renaissance style, by Mr. FRANK D. COOPER; but the majority of the class are country houses. Mr. A. C. BREDEN shows one rather dull in colour. A House at Sutton Coldfield, by Mr. ERNEST NEWTON, is rather boldly treated, for while on one side of the entrance half-timber work is used, on the other side the windows are curved bows, so large that walls of another kind become necessary. Freeby Manor, by Mr. HARRISON, is rather large, and the half-timber work is properly treated. Mr. R. WILLOCK's Angle of a Country House might be a portion of some ancient example. The new Picture Gallery in Sir FREDERIC LEIGHTON's house is Italian, and is lighted by a dome. The walls have a green ground, and the door is in black. The Music-room in the steamer *Tantallon Castle*, by Messrs. NIVEN & WIGGLESWORTH, and shown on two drawings by Mr. PENNELL, has lightness of effect, and is, therefore, better adapted for a vessel than some designs which have appeared, and might have been intended for work on *terra firma*. The design for the Decoration for a Morning-room, in wood and majolica, by Signor FORMILLI, is very rich in colour, and it is a pity the whole of one wall at least was not shown. There is dexterous skill in applying colour in the two designs for ceilings by Mons. BOEKBINDER, the bedroom being as quiet as is desirable. Mr. E. GOLDIE shows a fine hall at Ashorne Hill House, with a gallery; part, at least, seems old work. The additions by Mr. COLLCUTT to Coldharbour, Liphook, make of it a charming residence, the interest of which was increased by the disposition of the garden. Mr. B. BINYON has a satisfactory wing and porch for Aldermaston Court, Berks. Earlsall, Fife, has been restored by Mr. R. S. LORIMER, and forms a group which should tempt many Scotch proprietors to have ruins treated as skilfully. Mr. VOYSEY's House at Colwall is simple but quaint, his desire being to make the woodwork harmonise with the green slates. The farmhouse at Brickendonbury appears in a very small drawing and is treated in a picturesque way by Messrs. COX. We should like to have seen a drawing of Mr. HALL CAINE's house at Peel. The entrance, by Messrs. SCOTT & MORRIS, might be part of an early Norman church. Shireoak, Headingley, by Mr. F. W. BEDFORD, is a very quiet country house that is in keeping with its position. Teith View, near Douné, N.B., is in a different style, but is also adapted to local conditions. The Premises in Uttoxeter, by Mr. W. T. WALKER, display more massiveness in the pilasters and mouldings than is usually adopted. The Garden Pavilion on the Edge of a Lake, by Mr. D. KENNEDY, seems to be an academic exercise in Italian, but it would make a satisfactory structure. The Free Home for the Dying, by Messrs. YOUNG & HALL, shows a block arranged round three sides of a square, and is as devoid of ornamentation and other vanities as such a place should be. The Bed-

ford Court Mansions, by Mr. A. F. VIGERS, is well adapted for its purpose. There is nothing commonplace about it and it is represented by one of the best drawings in the room. The Cottages at Ninfield, by Messrs. TREE & PRICE, are excellent examples of treatment in half timber. Messrs. ERNEST GEORGE & PETO are this year represented by two halls, Colworth, Bedford, and North Mymms, both very characteristic, the latter being the more important. The Marble Entrance-hall, Moorgate Court, by Mr. H. HUNTLEY GORDON, is effective and suggests the change which is coming over the commercial buildings of the City. The same architect has four designs for country houses in the style that now obtains most favour. In Duncombe Park Mr. W. YOUNG shows one of those Anglo-Italian mansions with which he succeeds. The arcaded wings are an efficient feature, but some proprietors would be likely to demur to their employment. The Staircase Hall, Gosford House, suggests the advantages of a pure Italian style for a mansion, for it is not only dignified, but it is less likely to run out of fashion than some other styles that are more sought after. In Little Missenden Abbey Mr. SETH SMITH continues to work in the spirit of the old remains. The Sundial, Whatton House, and the view of Leenside by Messrs. BREWILL & BAILY, show a mastery of old English work. The dial is one of the most interesting efforts of revival that has appeared of late years. The Dutch Library in a house, Glasgow, by Mr. A. N. PRENTICE, might have been imported complete from The Hague. Bearroc, Berkshire, by Mr. BELCHER, is one of the most important among the few large mansions which appear this year; it is in red brick, and is so arranged as to present many picturesque aspects. Mr. R. A. BRIGGS shows two views of a house at Oxted. The Gables at Harrow, by Mr. A. MITCHELL, is striking from the smallness of the windows. Another house at Harrow is more satisfactory, as there is no aiming at singularity. Among other country houses on the wall are some by Mr. E. T. POWELL, Mr. C. J. FERGUSON, Mr. C. J. BLUMFIELD and Mr. JOHN BROOKE.

The Summer Cottage, Isle of Wight, by Mr. ASTON WEBB, is suggestive of a similar work in which pride was said to ape humility. It has much interest as a design. The building is arranged so as to form a set of terraces, culminating with one on the tower. A great many delightful views are therefore accorded to the inmates. The wall near the sea is laid on a curve, and enhances the attractiveness of the house. There is a freshness about the treatment which just now, when stereotyped forms are so prevalent, is enjoyable. The Dining-room, by Mr. JOHN CASH, is shown on an excellent drawing in colour. The room is Old English in its treatment. The White Cottage, Caterham, by Mr. FEDDEN, derives much of its effect, at least on paper, from the contrast offered by the green outside shutters and the red tiles of the roof. Mr. HAMILTON GORDON's House at Folkestone is another admirable seaside residence; the porch especially is noticeable. There are other residences by Messrs. BEAZLEY & BURROWS, BEDINFIELD, CRESSWELL, KENYON and CAVE; cottages by Mr. T. PHILLIPS FIGGIS, additions to a house by Mr. BERESFORD PITE, and a mansion at Storey's Gate by Mr. BASIL SLADE. The Château de Buillon, by Mr. BRYDON, we suppose is somewhere on French soil, but it could not be more English in style if it were to be erected in Surrey. Mr. W. WALLACE contributes a large castellated mansion, Philiphaugh, Selkirk, which suggests the advantages possessed by the northern architects in having a style. Mr. SETH SMITH's drawing-room in Waxwell Farm, Pinner, is a cosy interior, the ceiling being kept low and the windows being marked by breadth rather than height. Messrs. DARBYSHIRE & SMITH's Galtee Castle, co. Cork, recalls some of Sir RICHARD MORRISON's large residences, in which variety was preferred to unity. Mr. BEATTIE's Hotel in Edinburgh should not be introduced among private residences. If carried out as shown it will be the most imposing block in Princes Street, and the unfinished copy of the Parthenon not far off, as well as other Classic buildings in the neighbourhood, must hide their diminished fronts when compared with it. Edinburgh is unable to compete with less admired cities in its hotels, and when a new one on the modern system was to be erected it was proper to give the exterior a character which could not be overlooked.

ASSESSMENTS.*

AS by natural equity or by compulsion every inhabitant of a State is expected to contribute to its expenditure, the fairest system of assessing the amounts would be by proportioning them to the incomes, or, as some would say, to the outlay of the inhabitants. Direct taxation has, therefore, many advantages to recommend it for general adoption. In principle it is simple, and if men were perfect it could be easily levied. But as long as they are unable to identify public interests with individual interests, they cannot be expected to sacrifice the latter. The men who in all ages have had most experience of the power of self are those who are concerned in the imposing and collecting of taxes. They were compelled to adopt measures which made them odious. The Hebrew publicans, the French *fermiers*, were only notorious examples of a class. What was possible in England is suggested by the conduct of the collector of the poll tax which gave rise to WAT TYLER'S insurrection. The universality of the objection to direct taxation is suggested by the number of countries with absolute governments in which a tax on income is not adopted.

Indirect taxation has therefore to be substituted. The poll tax, said MONTESQUIEU, is the most natural to servitude, the tax on merchandise is the most natural to liberty. Anyone who has observed the treatment to which women have to submit at the gates of a foreign town, in which the octroi local duties are levied on all merchandise that enters, will, however, agree in saying there is not much difference as regards personal dignity between the two classes. But without a scrutiny which is liable to become degrading there must be evasions of the duty to contribute. In England the every day scrutiny that is practised abroad would not be tolerated, and in consequence taxation becomes more onerous on all who have no wish or opportunity to escape their responsibilities. As MONTESQUIEU pointed out, much had to be sacrificed in England for the sake of liberty, and taxes were levied which were more burdensome than those imposed by despotic princes.

The difference in weight of burdens was more apparent than real. The foreign princes and their successors in modern times utilise many sources for obtaining money. In England they were always few. Let any ordinary man or woman count the ways in which he or she has to contribute to the revenue in the course of a year, and it will be found that in the majority of cases there is not a dozen of them. It is true the major part of the revenue is derived from indirect taxation, but if the amount for income tax and the rates levied on houses and lands are excluded, it will be seen that the indirect taxation is derived from no great variety of sources. Simple as are these facts, they are not sufficiently considered and turned to account. If, for example, the importance of rateable property in general as a source of revenue were understood, would not steps be taken to insure an uniform system, and one with fewer uncertainties than now prevail be adopted to ascertain the value of property? The massive volume which Messrs. BOYLE and HUMPHREYS-DAVIES have prepared affords in its pages enough evidence to demonstrate that such a consummation is desirable.

As there are nearly twelve hundred pages in their work, it would be impossible to give an adequate account of the contents. But they are justified in announcing that they have explained such principles as are at present in use in relation to the assessment of railways, docks, tramways, gas and waterworks, coal and other mines, electric-lighting works, manufactories and other hereditaments. There is also a complete digest of all the important cases.

The procedure for assessment which is now followed is derived from the Act for the relief of the poor which was passed in ELIZABETH'S reign. In most places the value of property is determined by an assessment committee of the Poor Law Guardians. It could not be concealed that such men would not be competent to deal with difficult problems. Accordingly the rental was taken as the standard. As the Act of 1862 expresses it, "The gross estimated rental for

the purpose of the schedule to this Act shall be the rent at which the hereditament might reasonably be expected to let from year to year." In the majority of cases it would not be possible to discover a more satisfactory standard. There are cases of rackrented property as well as cases which are let below their value, but we cannot always expect mathematical precision or uniformity of conditions in financial affairs. Taxes based on rent have the advantage of being easily calculated and collected. The percentage to be paid to the tax-gatherers can therefore be very low. As the French octroi duties, on the other hand, cost from 20 to 30 per cent. to collect, we can realise the advantage of our English ways.

If in the case of houses there was no more to be considered than the amount paid by a tenant to a landlord, assessing would be child's play. But houses have almost as many varieties in their assessable qualities as they have of other kinds. Consider the stately homes of England. Some years ago there was an outcry when it was discovered that palaces like Chatsworth and Belvoir were each rated on a rent of not more than 200*l.* a year. But the amount will not appear unjust if we remember that the then Duke of DEVONSHIRE, who was only a bachelor with refined tastes, declared that he could not afford to live at Chatsworth for more than a month in a year. The cost of keeping property of that kind in a becoming condition would be enough to deter the majority of people from becoming tenants at a rent of 200*l.* The method which JOHN STUART MILL recommends with grand mansions and in all cases where the occupier is the owner is as follows:—"A valuation should be made of the house, not at what it would sell for, but at what would be the cost of rebuilding it, and this valuation might be periodically corrected by an allowance for what it had lost in value by time or gained by repairs and improvements. The amount of the amended valuation would form a principal sum, the interest of which, at the current price of the public funds, would form the annual value at which the building should be assessed to the tax." MILL did not realise that at present the appointment of an expert who alone would be competent to undertake the calculations is merely optional. The duties fall upon assessment committees and overseers; and it is not imperative to call in a valuer. According to 31 & 32 Vict. cap. 122, the guardians may appoint some competent person to assist the committee, but in ordinary cases he could not prevent his valuations from being altered. Where an immense sum is at stake and a valuer of the highest class is called in, his figures would no doubt be respected, but most committees are fond of "cooking."

What is to be regretted is that so often architectural qualities are supposed to be of no account. We lately published the evidence before the committee of the House of Lords on "Betterment." It was explained by one of the witnesses that when he was valuing one of the Lambeth parishes he dealt with St. Thomas's Hospital as if it were a plain building. That was an advantageous arrangement for the governors, because the rates were diminished; but it was remarkable that not one member of the committee appeared to be amazed. Structural cost and structural value are not always identical, for a building may be erected to gratify a particular individual, and his taste may not correspond with that of other men. The authors put the case plainly when they say:—"No doubt a tenant would presumably give a better rent for a handsome house than an ugly one, and it may be that a public company or institution may derive pecuniary benefit from such an outlay, as it may act to a certain extent as an advertisement; but such an argument applies in but a small degree, if at all, to say the façade of Euston Railway Station, nor would a manufacturer care to give a higher rent for a cotton mill having the machinery silver-plated and the walls decorated with bas-reliefs by some celebrated sculptor, than for a mill, however commonplace, if it were capable of turning out as much work at no greater cost." The illustration it will be observed suggests something that has been stuck on a building or a machine, and in that way it corresponds with the notion that is prevalent in the courts. If plans had to be approved by judges before execution, we are afraid all buildings would resemble packing-cases.

We suppose it is only natural for people to depreciate the value of the property in order to enjoy diminished

* *The Principles of Rating practically considered.* By Edward Boyle, Barrister-at-Law, and G. Humphreys-Davies, F.S.I. Second Edition. William Clowes & Sons, Limited.

taxation. In the same spirit efforts are made to obtain entire exemptions from assessment for buildings. For example, it was hardly worthy of so wealthy a corporation as the Institution of Civil Engineers to endeavour to be put on the same footing as ragged schools, and no less strange was the effort of the Art Union to be classed as an institution for the fine arts exclusively. The authors say it is anticipated that the latter case may be carried before a higher tribunal, and it would be well for the council to gain an opportunity to prove how art is promoted by them. Of late years it has become more difficult to determine what constitutes an exemption. It has been held that a residence occupied by the chief constable and chief police officers within the precincts of constabulary barracks was not exempt. Government telegraphs are rateable in respect to local, municipal and parochial rates. In fact, the old doctrine that property occupied for public purposes was exempted is now entirely obsolete. The Mersey Dock Board and other local authorities are taxed for the light-houses under their control, while the lights in charge of the Trinity House are exempted. Many canals can claim exemption, but the same grace is not allowed to railways. A passage relating to builders' yards and other premises will suggest the ease with which anomalies creep into the assessment system.

Reference has already been made to land in the occupation of builders for the purpose of erecting new buildings, but, as in many other points in the law of rating, there are, owing to variations in the facts, many difficulties in the way of attempting to deduce from the decisions a clear and definite principle which shall be capable of application to each and every case. It is presumed that if a builder put up a workshop, as is often done, and put sawing and other machinery therein for preparing his timber for the house, no attempt would be made to rate him. If, however, another builder erected his shop and machinery elsewhere than on the site of the new buildings, and there prepared his timber and then carried it to the house, he would be assessable in respect to the workshop. This would seem to be unfair as between two men, as the beneficial occupation would be practically the same in each case. Take, for instance, some large public work like the Severn Tunnel. The contractor erects large workshops, with numerous workmen's cottages, schools and library, for no other purpose than to facilitate the construction. It cannot be doubted that the whole of these hereditaments would be rateable and rated. There appears, therefore, no reason why, if the property is of sufficient value to make the rate worth recovery, such property should not be rated. To avoid injustice, the overseers of a parish should take care to allow no undue extension of such immunities, but that directly the occupation appears to become sufficiently beneficial and permanent, the occupier shall be put on the rate-book.

There is consequently a contest between authorities and those who have interest in property. On one side attempts are made to lower the value and obtain immunities; on the other side, not only is it tried to keep up the valuation of the property, but ingenuity is exercised in discovering new sources of income in it. For instance, a public-house is likely to be rated at a higher sum if a good billiard-table is introduced. A new machine would be likely to increase the amount of the rates paid on account of the factory containing it. Mills that were not in use have been assessed as warehouses for the machinery they contained. The distinctions between the causes that enhance the value of property are so manifold, it is no wonder that so large a volume is needed for discriminating between them. Lovers of the good old times could make out an admirable case on the subject of rating. How different is the method now employed from that which was enjoined in the reign of ELIZABETH. In those days every parish was ordered to pay a certain sum weekly for the use of the poor, but no parish was to pay more than 6*d.* nor less than $\frac{1}{2}$ *d.*, and when one parish was considered with another the rate was not to exceed 2*d.*

Messrs. BOYLE and HUMPHREYS-DAVIES'S "Principles of Rating" is not merely indispensable for all authorities who have to deal with taxation, but it will be found interesting by students of political economy. Surveyors who may expect to be consulted about the valuation of property will find it to be a mine of information.

THE BOSTON PUBLIC LIBRARY.

THE enterprise which was displayed in giving the commissions to Mr. Sargeant and Mr. Abbey for paintings to adorn the Public Library in Boston, which have been exhibited, has had the effect of drawing the attention of Englishmen to the new building. The work which M. Puvis de Chavannes is now exhibiting in the Champ-de-Mars will have a similar effect upon Frenchmen. Means will, we suppose, be also taken to bring the building before Germans and Italians. We publish a couple of views of the Library from the *American Architect*. In the same journal the following criticism on it has also appeared:—

There is something amusingly childlike in the way and degree in which the Boston newspapers are glorifying the new public library building just opened to the public. If their statements are to be believed, never was so good a building erected, never was there so profound an artist as the author of the design, never were there wiser and more long-sighted men than the trustees who directed the arrangement of the building.

It is very nice of them to forget all the gibes and sneers that have been poured out on the library and those responsible for it, for never has there been a building which, as it developed, has excited more unfavourable comment both from those who do know "what is what" and from those who do not. We believe there is hardly a single feature of the building concerning which we have not heard some one speak disparagingly. The posts about the sidewalk kerb, of various size and pattern, some ornamented with checker-boards and broiled chickens, have afforded amusement to some, while the treatment of the southern façade with its lines starting off to go somewhere and never getting there, have amused others. Some have protested that the Guastavino arches would never hold up, while others deride the scrawny cresting. The scale and material of the sculptured panels above the entrance, and particularly the nakedness of humanity there displayed, have not escaped condemnation, while the huge elephants' trunks that serve as candelabra, and seem to threaten to snatch up and crush those who pass just beneath them, are generally disliked. The strange and sometimes rather illiterate jumble that has been made of the inscribed lists of literary and other celebrities can never be alleviated, and so it is regrettable that the excuse for a part of it, the anagram of the architects' names, was discovered. On the whole we much regret that this discovery was made, though it is said to have led to a discovery of a similar nature which revealed an attempt which, if it had been carried out, might possibly have stirred up an actual riot. Then, too, the general arrangement of the plan has been condemned without qualification by those who believe in the Poole theory of segregation. The amount of light provided for the different rooms was by some declared sure to be wholly insufficient, while others have scoffed at the idea of so small an interior courtyard, and protested that it should be glazed over and used as a reading-room. The form, material and colour of the external roof covering have been condemned by many, and the expense and makeshifts entailed by it have been criticised by those who profess to know about them.

The long and short of the matter is that the public library building has been a perfect boon to those who seek an object for semi-ill-natured criticism ever since it was started, beginning with the waste of 10,000 dols. on the first competition, the further waste of more public money in laying foundations for a building which was known to be a preposterous piece of imperfection and culminating with the appointment of an architect who was not a Bostonian.

We do not propose to discuss these various objections, nor do we intend to consider the building critically with a view to determining its derivation. The work is nearly done, the money has been spent more or less judiciously and the result stands, if not for all time, at any rate for the immediate future.

Looked at as a result, as a whole, we are disposed to find it satisfactory and to agree that, taking it on the whole, the money has been well expended, and that the accomplishment is worthy of admiration, perhaps less satisfactory than some other architect could have produced with the same outlay, but who can prove that?

If, strictly speaking, there has been wasteful expenditure, we hold that on the whole the expenditure has been justified by the result. If the building is not above and beyond criticism, it is none the less the result of a more than commonly conscientious endeavour on the part of the architects, who rather than strive after successful originality have, from first to last, been content to adopt and adapt in their work those characteristics which have stood the test of time and earned the enduring approbation of men who are competent to pass judgment. One could wish there had been more of adaptation and less of adoption, for it is impossible not to feel that things might have been a trifle less hackneyed, without loss of abstract architectural merit. We do not believe that in the case of any given school of architecture the best work in that school might

Professor Hirschfeld, the German archæologist, died at Wiesbaden on April 19. He had charge of the excavations at Olympia during three years. The professorship of archæology in the University of Königsberg was assigned to him in 1879. Several important works were written by him.

not have been surpassed, or that it is beyond the range of possibility for a modern artist to carry the style on to a more advanced development.

There can be no gainsaying the extreme care, the con-

The experiment made at the Paris Hôtel de Ville, where artists of varied prejudices and different styles of work were employed, was not successful, though the ability of the men to whom the work was assigned should have assured success.

THE PUBLIC LIBRARY OF THE CITY OF BOSTON.

scientiousness, the painstaking endeavour that the architects have put into this work; they have been monumental, and if for no other reason than that work done in this way is a useful object-lesson, a considerable part of the outlay must be held justifiable. It is not possible to believe that the lesson will be without effect on other architects and other communities. If a result is to be good, time and money and understanding effort must be expended without stint, and as it is the fashion of the day in this country to believe that money is the only thing it is necessary to provide in order to secure a satisfactory result, it is small wonder that the actual results are so unsatisfactory as a rule. Clients are generally willing to provide the money, but they are rarely willing to grant time enough. Architects are amply able to spend all the money that may be provided, but there are not too many who know how to exert their efforts understandingly. It is rare indeed when all three requirements can be united and satisfied in a single piece of work.

Whatever may be thought of the exterior, and opinion as to the real merits of the exterior treatment is very varied, there is practical agreement by all that the effect of the interior is extremely good in so far as regards its architectural character. How far the applied decoration that is to follow will be successful in uniting the now somewhat disjointed parts into an harmonious whole can only be determined later. The final effect can hardly be guessed at, for the colour scheme is not disclosed and the part that colour is to play is so great that success, partial success or absolute failure in the work of the artist decorators may easily make or mar the whole. The reputation of the building as a work of architectural art is largely in their hands.

The reason, apparently, for the somewhat unsatisfactory result in Paris is that the work of the several artists is brought into too close juxtaposition, and as each man sought to make his portion more noteworthy than his neighbours, the result is a discordance and unevenness that is not pleasing.

Here in Boston the chances are somewhat better, the rooms are more isolated and each artist's work can better escape the jarring effect of an inharmonious neighbour's. Particularly is this the case with the staircase-hall, which is about as complete and independent a feature as a staircase-hall well can be. We confess to having some misgivings as to how far M. Puvis de Chavannes can succeed in making his treatment of the wall-panels harmonise with the strong rich colouring and high polish of the Siena marble of the staircase itself. For an artist whose aim is to decorate the wall-surface, to enhance the value of the wall as a structural necessity, and not consider it as a mere piece of blankness on which to present an arrangement of coloured pigments, we fear that the actual wall-space of the panels may be found somewhat inadequate. But if his treatment does not prove successful, the loss will be to himself and his work and not to the architects and theirs. No failure of the wall decoration, any more than the rather tame and ineffective lions of Mr. Louis St. Gaudens at the main landing, can prevent this staircase and its containing hall from being a satisfying architectural achievement.

ENTRANCE HALL, PUBLIC LIBRARY OF THE CITY OF BOSTON.

Bates Hall, while architecturally and structurally interesting, is an even more doubtful problem, for here the decorators have to decide how to bring into some sort of harmony the neutral and rather sad-coloured tints of the apartment and the harsh colour of the Nubian and verde antique marble door-finish on the west side.

The public is not yet ready to express an opinion as to how far the library is successful in its working, and though murmurs of dissatisfaction are heard, yet the fact that only a portion of the building is open to them leads the grumblers to express only qualified disapproval now, in the hope that when every department is in operation the causes of dissatisfaction will be found to have disappeared. At present the chief head of complaint is that, in spite of the elaborate system of pneumatic tubes, carriers and electric signals, and an enlarged corps of assistants, the actual distances are so great that a reader occupying a seat at the north end of Bates Hall is not served with even the rapidity customary in the old building.

A rather interesting incident transpired when the time came to move the statues and busts from the old building to the new, the Art Commission at this point suggesting that the placing of all public works of art was by law vested in them. As the president of the board of trustees of the library is *ex officio* a member of the Art Commission, there was no desire to gainsay the suggestion, and the Art Commission accordingly acted in the matter, and thereby established a very useful precedent which may be of utmost value hereafter.

TESSERÆ.

Reynolds's Experiments on Old Paintings.

IN his anxiety to discover the composition of the Venetian colours and to trace the system of laying them on, Reynolds is stated by Malone to have rubbed off the layers of paint from several valuable old pictures. Leslie doubts their value. "It is not credible," he says, "that he who told Northcote he would be content to ruin himself to obtain a really fine work of Titian could destroy an excellent work of any master. There is always an abundant supply of inferior old pictures, of the schools and times of all the great painters, in the hands of dealers; and as such pictures were painted with the materials in use by the best artists of their own time, it could only be such that Reynolds destroyed." Northcote, however, confirms the account of Malone, and says that the experiments were conducted at an immense expense. He remembered, in particular, that Reynolds once scoured down to the very panel a capital production of Parmegiano. Sir Joshua frequently restored damaged works of the old masters, "and often made them," says Northcote, "both in effect and colour vastly superior to what they had ever been in their original state." He retouched a ruined portrait by Velasquez of the son of Philip IV., "and to such purpose," says Leslie, "that few by Velasquez now look better." He painted a new background to a portrait by the same artist of a Moor blowing a pipe, "and with this, and some few other small alterations," says Northcote, "it became one of the finest pictures I ever saw." "These restorations of Velasquez," adds Leslie, "would, I am persuaded, amply compensate for whatever pictures he destroyed."

Old English Badges.

The badge that probably possesses the greatest local notoriety is the Pelham buckle, so well known on the estates of the Earl of Chichester, in the eastern districts of the county of Sussex. It may be found on nearly, if not quite, a dozen churches, on the old mansions of the noble family, and on their tenant farmers' houses. We pass by it as the sign of an inn, to find it again on the milestones by the roadside; we look over the hedge and see it marked on the broad haunches of flocks of genuine South Downs. John de Pelham, an ancestor of the Earl of Chichester, assumed this cognisance in commemoration of his having been present at the capture of the French king at the battle of Poitiers. Another badge, assumed from the same event, is that of the Earl of Delaware. It represents the crampit of a scabbard—the ornament at the end, which prevents the point of the sword from protruding—first borne by Sir Roger de la Warr. There can be little doubt that these two badges were originally the actual objects which they now pictorially represent, and had been part of the king's trappings torn from him in the desperate struggle of the different persons who claimed him as their prize. A peculiar description of badges worn by a few noble families were termed knots, being merely threads of gold or silver lace and parti-coloured silk, twisted and knotted into certain fantastic but distinct forms. When carried on stone this ornament frequently formed a continuous line of fretwork round a building. The Stafford, Wake and Bouchier knots are well known to antiquarians. Sometimes objects were chosen as badges which, from their designations bearing the desired sound, represented the name of the wearer. These symbolical puns upon surnames were known as rebuses. The comparisons of Mowbray, Duke of Norfolk, were embroidered with mulberries on that memorable occasion when he appeared in the lists "at Coventry, upon St. Lambert's Day." The badge of Arundel was a swallow—in French, *hirondelle*; that of Harrison, a hedgehog—in French, *herisson*. The rebus, however, was

mostly used by ecclesiastics, almost every bishop and abbot having one with which, carved on stone or painted on glass, they adorned their dwellings and the churches, colleges or other edifices that they erected, endowed or repaired. Many of these are still to be seen. The abbey-church of St. Albans displays in many places the rebus of Abbot Ramridge—the representation of a ram standing on a rocky ridge. In Abbot Islip's chapel in Westminster Abbey his name is represented in three different modes—an eye and a slip of a plant; a man slipping from the branch of a tree, and exclaiming, "I slip"; and the capital letter "I" beside the slip of a plant. The rebus of Prior Bolton of St. Bartholomew's, in London, was a bird bolt (an arrow) inserted in a ton; that of Bishop Middleton, the letter "M" in the middle of a ton. Alcock, Bishop of Ely, and founder of Jesus College, Cambridge, covered the most conspicuous parts of that building with the representation of a cock standing on a terrestrial globe, the latter being considered symbolical of "all."

The Neglect of Athens.

Till the year 1678 Greece was almost as much lost and unknown to Western Europe as Pompeii and Herculaneum. It is true, indeed, that more than two centuries before this time Ciriaco de' Pizziccoli, a native of Ancona, had visited the country in search of Greek inscriptions, of which he was such an ardent amateur that, being informed by a fellow passenger while he was on his voyage homeward of the existence of an ancient marble which had escaped his notice, he immediately left the vessel and went back eighty miles by land to examine it. But the "Itinerarium of Ciriaco," containing a brief account of his journeys in Greece and other countries, which he wrote at Florence in the year 1441, remained three hundred years in manuscript, and was first published at the same city in 1742. We have no account of any travels in Greece during the sixteenth century; and the only document from which we can glean any information concerning the then state of the country is a volume entitled "Turco-Græcia," published at Basle in 1584, and containing a history of the city and church of Constantinople during the fifteenth and sixteenth centuries, written by Greeks residing in that city, with a collection of letters from writers at the same place and of the same nation, addressed to Martin Crusius, a scholar of Melancthon, and professor of Greek and Latin at Tübingen. One of his correspondents, a native of Nauplia, assures the Professor that wisdom, science, arts, learning, valour, wealth, and all other good things, have departed from Greece, and that the Muses themselves have quitted Helicon and Parnassus, and have settled, he supposes, at Tübingen. The same writer reproaches himself for wasting words upon such a wreck as Athens. "Why," says he, "do I dwell upon the description of this place, which is like the hide of an animal that has been long dead?" From his conversations with another Greek, the Professor himself infers that Greece had ceased to exist in Greece and Athens in Athens. These and many other passages of this volume, in which the writers feelingly deplore the degraded and desolate condition of their country, would tend rather to discourage than to invite the curiosity of travellers, if the book attracted any notice at the time. But the letters are so dull in style and so barbarous in language, that few would be tempted to search for the little information they contain. From 1584 to 1678 we have still only two or three scanty notices of the condition of Greece, and these are so replete with fictions and absurdities that their authors could never have ventured to blunder, or to invent, with so much boldness, if they had not been assured that the ignorance of their contemporaries would secure them from detection. The following account of the Athenian Acropolis, which we find in a volume entitled "Archæologia Attica," by F. Rous, scholar of Merton College, published at Oxford, in 1671, could scarcely have been surpassed by Munchausen:—"This citadel now remains the succour and shelter of the barbarous Athenians, in which alone dwell janizaries to the number of seven hundred thousand, as Christophorus Angelo told me, and avouched it, I fearing lest he had mistaken the number."

The Serpent in Art.

In Francklin's interesting researches on the Jains and Buddhists he has given an interesting account of the "Serpent Worship." He observes that it was mixed with the Jewish ordinances; that the dragon, or great serpent, was worshipped in Babylon, in the reign of Cyrus, as recorded in the Apocrypha. Bryant observes that, in the orgies of Bacchus, the persons who performed the ceremony carried serpents in their hands, calling with horrid screams upon Eva, or the serpent. Thermitis, or Ob-oub, or Basileus, was the royal serpent of Egypt. The Cuthites had always some legends of a serpent. At Colchis, Thebes and Delphi the same worship prevailed. The serpent, according to Montfaucon, was a symbol of the sun; and Eusebius has observed that a serpent within a circle, touching it at the two opposite extremes, signifies the good genius, the Eudaimon of the Greeks. Vossius, in his 63rd chapter, on

"Pagan Idolatry," details the origin of the serpent worship, affirming that it commenced in Chaldea. Pythagoras brought the worship from Egypt to Greece, and thence it passed into Italy. The serpentine pillar of the Hippodrome, and the temple at Delphi, were erected in honour of Apollo, in commemoration of his victory over the great serpent Python. Esculapius, the Grecian god of physic, has a serpent emblem amongst his attributes. In Persia, Zoroaster, or Zerdusht, is represented as girded by a serpent; and in one hand of the figure, which represents the planet Saturn, is the serpent. In India the serpent Vasuka, whom the Surs and Assurs used as a rope in churning the ocean, is too well known to need description. In the time of Pausanias a statue of Minerva was to be seen at Argos made of marble, and which exhibited two serpents unfolded at her feet and protected by her shield. Colonel Francklin further notices that the serpent worship prevailed in Russia and other northern nations, and also in Mexico and Peru. Faber describes the Vitzliputuli, or deity of Mexico, as holding in his right hand a staff cut in form of a serpent; while the four corners of the Mexican ark terminated in carved representations of serpents' heads. Here also was the Cihnacohuatzi, or "woman of our flesh," who was represented with a great serpent. The Evil Being of the Goths is said to have had two children—death and an immense serpent, the latter of which wound himself round the whole globe of the earth. The Goths were a branch of the Cuthites, who came from the Indian Caucasus; and Thor or Woden is the Buddha of India, the great father of Scandinavian mythology, who dragged the serpent Midgard from the bottom of the sea. In Stonehenge the serpent Hu was venerated, and the circle at Abury enclosed two other circles, and was attached to an enormous snake formed of upright stones with a fourth circle for its head. This god is represented with wings. In conclusion he observes that it would appear that the royal sacred serpent of Egypt, the serpent Canophis or Cneph, as seen in the temples of Thebais; the serpentine deity of Persia as represented on the walls of Persepolis and at Nakshi Rustom; the serpentine devices of the Chinese; the globe and winged serpent of the Chaldean Magi; the great serpent Ananta Sesha Naga, and Vasuka, of Hindoo mythology; the Mexican serpent, and the Midgard of Scandinavia all spring from one and the same source.

Gothic Buttresses.

The whole northern buttress system is based on the grand requirements of tall windows and vast masses of light at the end of the apse. In order to gain this quantity of light, the piers between the windows are diminished in thickness until they are far too weak to bear the roof, and then sustained by external buttresses. In the Italian method, the light is rather dreaded than desired, and the wall is made wide enough between the windows to bear the roof and so left. In fact, the simplest expression of the difference in the systems is, that a northern apse is a southern one with the inter-fenestral piers set edgewise.

Old St. Paul's.

Are we to mourn with unmitigated sorrow over the demolition of Old St. Paul's? Of England's more glorious cathedrals none could be so well spared. Old St. Paul's had nothing of the prodigal magnificence, the harmonious variety of Lincoln, the stately majesty of York, the solemn grandeur of Canterbury, the perfect sky-aspiring unity of Salisbury. It had not even one of the great conceptions which are the pride and boast of some of our other churches—neither the massy strength of Durham, "looking eternity" with its marvellous Galilee, nor the tower of Gloucester, nor the lantern of Ely, nor the rich picturesqueness of Beverley, nor the deep-receding, highly decorated arches of the west front of Peterborough. Even in its immediate neighbourhood, though wanting a central tower and its western towers, not too successfully afterwards added by Sir Christopher Wren, the Abbey, with its fine soaring columns, its beautiful proportions, its solemn, grey, diapered walls—the Abbey, with its intricate chapels, with its chambers of royal tombs, with Henry VII.'s Chapel, an excrescence indeed, but in sufficient harmony with the main building, in itself an inimitable model of its style, crowned by its richly fretted roof—the Abbey of Westminster would have put to perpetual shame the dark, unimpressive pile of the City of London, Westminster modestly reposing in its lower level—St. Paul's boastfully loading its more proud, but more obtrusive eminence.

The Pnyx, Athens.

To form an idea of an Athenian assembly in the flourishing times of the republic, we must imagine the open space, the Pnyx, consisting of about 12,000 square yards, occupied by nearly 6,000 citizens seated in groups within it. In the presence of this vast multitude one man arises, he ascends the stone steps and takes his station on the pedestal, which is called the "Bema," at the centre of the perpendicular rock. He has before him not merely the 6,000 Athenians, but the city of

Athens. Lying at a little distance beneath him he beholds the Agora, filled with statues, and altars and temples, and he is thus brought into the presence of the great men of old, the heroes and the deities of Athens. Beyond it he sees the Areopagus, the most ancient and venerable tribunal of Greece; above it, on the right, is the Acropolis, presenting to his eyes the wings, the portico and pediment of the noble Propylæa; towering above them in the air, and looking towards him, is the bronze colossus of Minerva Promachus, armed with helmet, spear and shield, appearing from her proud eminence to challenge the world in defence of Athens; rising in severe and stately splendour to the right is the Parthenon, exhibiting its front of eight huge marble columns, surmounted with sculptured metopes and pediment, filled with marble figures of horses, men and gods, dazzling the eye with painting and with gold. Visible to the north, beyond the city and its walls, are the plains and villages of Attica, its cornfields, its olive-grounds and its vineyards lying in rural quietness, made more peaceful by its contrast with this stirring scene; further in the distance are the castellated passes of Phyle and Decalea, and in the horizon the high mountain-ridges of Parnes, Brilessus and Pentelicus. Such are the objects which the Athenian orator sees before him from this pedestal of stone. To his left is the road to Eleusis, the Sacred Way, which, passing through the beautiful suburb of the Cerameicus and by the groves of the Academy, and crossing the stream of the Cephissus, climbs over the western heights of Mount Ægaleos; visible in the rear are the two long lines of wall, which, running along the plain for nearly five miles, unite the city with the Piræus. There are the masts of vessels riding in the harbour, merchantmen bound for Pontus, Egypt or for Sicily; fleets which have gained for Athens empire and glory in distant lands—in the islands of the Ægean, in the peninsula of Thrace, and on the coast of the Euxine. Further to the left is the glorious Gulf of Salamis; on one side of it is the hill on which Xerxes sat to view the battle fought beneath him, and on the other is the Cape, where stands the trophy of Themistocles. Such is the scenery of the Pnyx, such are the objects which surround the Athenian orator as he stands on its Bema. In their presence he speaks. In dread, therefore, mixed with delight, inspired by such a spectacle, he proceeds to address his vast audience, like a general going to a battle, when he sees the flags and banners of his country's glory unfurled and streaming before his eyes. These objects are to the Athenian statesman and orator, standing on the rostra of the Pnyx, what his brave Epirotes were in after ages to Pyrrhus upon the plains of Italy. They are the wings which waft him to glory. They are also, if we may so speak, the levers by which he uplifts his audience, for they stir their hearts as well as his own. Let no one, therefore, wonder that in such a soil as this eloquence flourished with a vigour elsewhere unknown.

Scottish "Burghs."

The most perfect example of these remarkable edifices situated upon the island of Mousa, near to the mainland of Zetland; but many remains of them can still be traced both on the northern and western isles in Caithness and Sutherland, and on various parts of the north and west coasts of Scotland. They are nearly all formed precisely on the same plan, though differing considerably in size. The form is a truncated cone, occasionally slightly varied, as in that of Mousa, where the wall curves inwards till it attains a certain height, and then returns gradually outward again, apparently with the same design as the corbelled battlements of a later date, which enabled the defenders more effectually to annoy any assailant who ventured to approach the base. With this exception the exterior displays no ornamental projections or any provision for defensive operations, by means of window, loop-hole, or machicolation. The rude but very substantial masonry of the exterior is only broken by a plain, narrow doorway, which, from the absence of gate-posts, grooves, or any of the ordinary refinements of more modern architecture, it is not improbable was secured, when danger was imminent, by building it up with a pile of stones. Within the exterior cone a second cylindrical structure is reared, the walls of which are either perpendicular or constructed at an angle which, leaving a space between the two of about 6 feet at the base, brings them together at the top. Within this space between the walls a rude staircase, or rather inclined passage, communicates round the whole, and a series of chambers or tiers of interspaces, formed by means of long stones laid across from wall to wall, so as to form flooring and ceiling, are lighted by square apertures looking into the interior area. This central space is open to the sky, and the fact of the only light to the chambers and passages within being derived by means of apertures opening into it, seems to preclude the idea of its ever having been roofed. It is not apparent, however, by what means the occupants could obtain access to the ramparts, so as to resist an assault and prevent the walls from being scaled, though a sufficiently rude and simple wooden structure may have supplied this very obvious defect.

NOTES AND COMMENTS.

ALTHOUGH many inquirers have occupied themselves with the history of ALBRECHT DÜRER, that subject is unfortunately still incomplete. Happily, the gaps are incentives to research. The latest discovery is that DÜRER, about the year 1503, was occupied with wall-painting and ceiling-painting in the castle of Wittenberg. The room entrusted to him was known as the "geschnitzte Stube," probably because it was adorned with carving. Apparently the paintings remained until 1611, but after that time there is no record forthcoming which relates to them. The castle suffered during the Thirty Years' War, and afterwards during the Seven Years' War. It was not spared during NAPOLEON'S invasion. It now is used as a barrack. During the repairs and alterations DÜRER'S handiwork may have vanished. On the other hand, there is a possibility that a part of it may be found under the thick coatings of whitewash to which the castle was subjected. It is therefore proposed to appeal to the Emperor of GERMANY for permission to have some experiments tried in the most likely places, and as there is nothing unreasonable in the supposition that DÜRER'S paintings may be partially preserved, we may suppose that something will be done to clear up the doubts.

ART is undoubtedly advancing in the United States, and it would not be surprising if some of the cities endeavoured to rival those in Italy by patronising artists. In spite of the warning which the failure of the wall-paintings in London and Munich might be supposed to express, it was decided lately that the Congressional Library was to be enriched with wall-paintings. Commissions for the purpose were given to Messrs. BLACHFIELD, LA FARGE, VEDDER, GUTHERZ, SIMMONS, MAYNARD, KENYON COX and DODGE. The determination to undertake so much costly work must have a beneficial effect on many kinds of decoration. The position now attained by mural painters in America becomes evident when it is found that they have formed a Society. The aim of the founders is to promote the delineation of the human figure in its relation to architecture, whether rendered in pigment, stained-glass, mosaic, tapestry or other appropriate medium, and at the same time to foster the development of its ornamental concomitants. The members of the Society are not only to be qualified to depict an expressional figure composition in a given space, but also to plan and control the entire decoration of a building. There would be something of a revolt against the architect's office if the planning and controlling were insisted on, but we assume what will be done is to offer suggestions to architects. Mr. JOHN LA FARGE has been chosen for the first president of the Society. He has executed many decorative works, and some of his designs in the exhibition of the Champ-de-Mars this year have excited the interest of Parisians as well as his countrymen.

THE report of the Council of the Manchester Whitworth Institute states that the interruption of the original scheme by the removal of the great schools, besides other causes, has occasioned certain changes in the body of governors, rendering a revision and renewal of the list desirable. The Council consider that the provisions of the charter of the institute should be carefully revised. While the schools were still included within the undertaking of the institute, specifications were issued for proposed buildings on a comprehensive plan. Twenty-three designs were sent in, and Mr. WATERHOUSE, R.A., as referee, named those which appeared to comply best with the printed instructions and with the economic views of the Council, the plans and designs of Mr. J. W. BEAUMONT, architect, of Manchester. While contemplating the establishment of the full scheme of the Manchester Whitworth Institute as originally laid down, the aspirations of the Council had been buoyed up not only by hopes confidently held out to them of large contributions from friends, but also by the expectation of a substantial subsidy from the Corporation. The latter, of course, fell to the ground when the city took over the schools, and the former promises have not yet been fulfilled. The legatees of Sir JOSEPH

WHITWORTH have practically given to the Institute (exclusive of 60,000*l.* appropriated to the Technical School) a sum of 157,000*l.* They cannot be expected to give more. The guarantors of the Royal Jubilee Exhibition have given 20,000*l.*, and two donors 500*l.* each, for the purchase of works of art. The Council cannot, however, but consider that for the effectual development of the institute, even under its more compact scheme, the public will have to be invited to interest themselves, by donations and subscriptions, in its welfare. The Council have been able, by an endowment of 50,000*l.* from the WHITWORTH legatees, to arrange for the erection of galleries for the custody and exhibition of the gifts and purchases. The committee obtained and carefully revised the plans prepared by Mr. BEAUMONT for a simple and effective arrangement of a north gallery, 78 feet 6 inches by 32 feet 6 inches in width, on the north side of the park along Denmark Road, with a central gallery extending southwards 79 feet by 39 feet connected with it behind the present house, leaving the latter for committee-room, library offices, &c., and for future replacement by a principal building with its own important façade. The buildings are so arranged as to admit of extension when required. The galleries will reproduce in character the picture galleries which proved so effective in the Jubilee Exhibition. On July 27, 1894, the Council finally approved of the plans, and, having taken tenders, resolved to accept that of Messrs. R. NEILL & SONS, to build the two galleries and complete the necessary alterations in the house, for the sum of 10,264*l.* The contract was forthwith completed, and the works are now in progress and already indicate their character and extent. It is expected that the new galleries will be ready for occupation in the summer of 1896.

THE Governors of the Bow and Stepney Foundation Boys' School are about to add to their present school buildings a science department, and have selected, from a limited competition, the designs of Messrs. THOMAS & HOWARD CHATFIELD CLARKE. The additions will include a chemical laboratory, with preparation-room, a lecture theatre, physical laboratory and mechanical instruction-room. The additions will form a complete wing, in themselves, to the present building, and the elevation to the wing has been made to harmonise with the existing premises, which are situated in Tredegar Square, Bow. Messrs. THOMAS & HOWARD CHATFIELD CLARKE have recently completed the new chemical laboratories for the Cowper Street Schools, and also those for the Mercers' Company's School in Holborn.

WE are asked by Mr. STOKES to make it known that he has a few back volumes of the New Series of the "Sketch Book" still on hand, which he will be glad to dispose of for the following reasons: *i.e.* having completed the New Series, it is necessary to close the accounts, and in order to meet the last of the liabilities it is desirable to realise the only asset, viz. some twenty copies in all of the last three or four volumes. During the whole of the thirteen years over which the New Series has spread itself, the committee have always paid their way, but matters were cut so finely that, in order to settle the accounts, the whole of the volumes printed must be sold. "I think it is generally admitted," adds Mr. Stokes, "that the volumes of the 'Sketch-Book' are about the best value for the money that can be obtained anywhere. I therefore trust that when it is known that the sale of the last few copies of the Series will enable the committee to send a final cheque to the printers, there are many who will feel disposed to lend a helping hand. I should, perhaps, mention that each volume contains seventy-two plates, a title-page, and index, and is quite complete in itself. The price is one guinea, unbound, and we have copies of volumes 7, 8, 10 and 12. I shall be glad to send copies on approval if desired, but as the whole series can be seen at the British and South Kensington Museums, the Architectural Association, and the Royal Institute of British Architects, I trust I may receive nothing but orders (enclosing cheques), which shall be promptly attended to."

DESIGN FOR COUNTRY CHURCH.

SCREEN IN THE GREAT HALL, AUDLEY END, ESSEX.

SPA MANSIONS, BERMONDSEY.

THE block of model dwellings shown in the illustration stands on a site at the corner of Spa Road and Grange Road, Bermondsey. The building, which has a frontage of 106 feet, consists of basement, ground floor and four storeys, surmounted by a flat roof. The entrance is by a staircase on the extreme right and left, terminating in towers on either side. There is also a spacious lift for the purpose of taking up furniture, &c. The front of the building is set back on the first, second, third and fourth floors to admit of wide balconies, by which access is gained to the several dwellings. The ground floor is devoted to shops, of which there are five, and an archway in the centre leading to a courtyard in the rear to be used as a playground for children, &c. The staircases and balconies are of artificial stone. The floors are virtually fireproof, being of rolled iron girders filled in with coke breeze and cement.

The basement is devoted to cellars which are attached to the shops; also the lift, &c. On each of the upper floors are five suites of rooms, most of them unusually spacious, and each set is supplied with kitchen containing a kitchener, sink, copper and dresser, with a w.c., dust shoot, and provision for coals. Every room is ventilated into a shaft, and there is abundance of light everywhere. Windows are placed at intervals up the staircases; in fact, there is not a dark corner in the whole building. The tenements are arranged as if they were a number of cottages placed in rows of five, each row stacked one above another. The balcony represents a footpath, and the front doors open on to it, so that there are no hidden entrances, as all the doors face the street. The front room is supplied with a bay window, and each set of rooms resembles as nearly as possible an ordinary house. Every tenant, therefore, can sit at his window and either see the traffic in the street below or the extensive views obtainable over the neighbouring houses. While the building is one as regards its structure, every set of rooms is isolated as much as if upon the ground. The roof is cemented and is to be used for drying purposes. The building was erected by Mr. JOSEPH DOWN (the owner), with picked stock bricks, with red brick arches and label over same. The cornices to towers at eaves are also in red moulded bricks. The architect is Mr. JOHN JAMES DOWNES, of 11 The Parade, Lewisham.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair. The house list for the session 1895-96, as prepared by the committee, was read, Mr. Caröe being nominated as president. Mr. C. W. WHALL read a paper entitled

Painting, and its Relation to Architecture.

He said:—It was a very large and difficult subject at any time—one to which a single lecture could give but the barest and the baldest outline. The more so, when they were lately told by the President of the Royal Academy (in his speech at a recent Academy banquet) how deeply we must be struck with “the vehement and almost feverish strife of conflicting theories and opinions which is rife about us”—a description not overcharged.

I hope you go to picture galleries. I hope you go often. You will soon have them thrown open to you in lavish abundance, and I will speak my few words now with the view of your being able to use them as a sort of guide which may give you some small help in steering your course amongst the conflicting schools and systems.

First, then, let me make to you the probably disillusioning announcement of my firm conviction that the one great, peculiar, characteristic virtue pertaining to the art of painting is the deft and exquisite laying on of paint. Small, simple, half contemptible as this may seem, it is the only key to the study of the art of painting, and I want to direct your keenest attention towards it, in order that you may be able to search for this quality in pictures, and know it when you find it. I

cannot recommend you to begin your search for it in the exhibitions of to-day, but go to the National Gallery and look carefully at the drapery in Veronese's *St. Helena*, and try to realise the felicity of Ruskin's description of the painting of Veronese. I cannot find the quotation, but he describes it as consisting of touch after touch laid on with a balanced, trained and instantaneous skill similar to that of his finest fencing.

Look for yourselves and see the light come rippling down the edges of the folds, not in clumsy zigzags but in touches sensitively modelled from end to end, so that no two points of them are alike, and yet put there by a hand working at lightning speed, but with the same control with which the most perfect violinist pours out the cascade of his melody. Just look at the shape of each of the little touches of high light with which some sheen upon the silk dies away. Each is like the petal of a flower. Look at the shadows, liquid and deep; like shadow, you can look down into them as you look down into those of running water, the same transparency, yet mystery. See how the colours have been floated over one another in thin films with the most absolute knowledge of what effect the colour below will have seen through those veils, how each will operate upon each; and you will soon begin to recognise that this is an infinite science, that such a painter, like a great composer in music, out of the infinite numbers possible to him, fuses together by the flashing instinct of his genius in one vivid moment those which will make the harmony at which he aims. Do you think me too enthusiastic? That such a trivial thing as laying on moist pigment with a hog-hair brush does not call for all this warmth? Well, let me justify it by a contrast. Walk away from the Veronese and look at the painting in one of Landseer's pictures—and I purposely choose as example the cleverest work I can find to point out to you the difference between cleverness and genius.

With your eye full of the sweet tremulous iridescence of the *St. Helena*, where you cannot put a pin's point upon two bits of colour exactly alike (any more than you could upon the same thing in nature), look at the Landseer; a mass of opaque splashes, where you can tell to a hair's-breadth where a square inch of yellow ochre leaves off and one of Roman ochre begins. Look at the high lights, like chalk marks, and the “high darks,” like ink marks, and if you think that at any rate the hide of the dog is a triumph of skill, just go and look how Holbein paints fur in his picture of *The Ambassadors*, or in the portrait of Christina of Sweden, Duchess of Milan. Then take another look at the Veronese, and then go back to the Landseer; you will feel as if, after watching some graceful and skilful dancer, the rustling of silks and the sound of music, you had suddenly presented to you the vision of some country clown plodding in miry ways.

But now let us pause a little. You will be asking me, “What, then, do you mean to say that Landseer's work is all bad art, and of no use?” If I were to say such a thing I could not stop at saying it, but should have to include far higher names, and tell you that the art of Michel Angelo and Leonardo da Vinci was also bad and of no use, for in the sense in which Venice understood the word, and the sense in which I am speaking, neither of these men could paint. The same might be said in a less degree of Raphael, of Botticelli, and an aching void indeed would have been left in the world's story if the work of these men had been left undone.

Yet the history of the world has been ever full of mistake and perplexity; malicious fortune seems ever bent on putting the square man in the round hole and marring all our chances, and we need not, out of reverence for these great beings, refrain from asking ourselves why Fate did not permit Botticelli to complete the painting of the Sistine, and provide for Michel Angelo instead some tremendous cathedral front of sculpture which his hand would have been so much more able and so much more fain to do. But things being as they were, we may be thankful that those grand forms have been presented to us, though we may wish that they had been in marble instead of fresco. The peculiar virtue of sculpture is noble form as that of painting is splendid colour, but you are to note that there is always a special hand skill which goes with each, and is probably therefore inseparable from it, and is that on which it depends. In painting it is that swift sensitiveness of touch which I have tried to describe in Veronese, and Mr. Ruskin compares to fine fencing, and in sculpture the same thing is true. Nobody, I am sure, can look at a half-carved figure of Michel Angelo's without seeing that the toolwork there has been of a kind almost as perfect and unerring as the work of nature. And yet so distinct is the sculptor's peculiar virtue from that of the painter that the man who could do such work as this in marble was so poor a painter that if his painting had been spent on anything but the noblest forms it would have been simply insignificant—we need think no more about it—whereas we could not look at a single square foot of any fine Venetian picture upside down without seeing that it is the outcome of a skill and training and hereditary fineness of breeding which must give us constant argument for hope and faith in the dignity and perfect ability of the human race.

Those of you who may happen to have seen in any exhibition any of my own poor efforts in art will be surprised to hear me insist so strongly on this purely technical skill. I do not undervalue high ideal, exalted thought, fine allegory, poetic intention, religious fervour—rather, perhaps, by nature I am tempted to lean on them too much; but it is my duty to tell you the truth, which came neither quickly nor easily to myself, but which is all the more sure for its having been slow, that all these things, all these fair thoughts and aspirations and ideals, good as they are in themselves, are only of the nature of good intentions (and we know where *they* go) until they have shaped themselves into deeds worthy of them by fine craftsmanship. A work of art which appeals from manifest technical shortcomings to the lamely-expressed goodness of its purpose damages more than aught else can do the cause it pretends to advocate. Really earnest workers in the same arts who are in search of example and strengthening will submit it to stern testing and questioning, will find it a broken reed and throw it aside, and without pretending to any inspiration from like motives, will outdo it themselves, and pass it by until the world itself will at last discredit it, and the final impatient comment on it will be, "Yes, yes, yes, we know what you want to say, but show us what you can do."

The warning of these dangers, then, is needed—and especially by you; for the kind of painting which architecture draws into fellowship and co-operation with itself is (much to the honour of architecture) almost always of that kind which starts with high motives and deals with high themes. It is for this reason that I have been at such pains to point out to you the special technical and craftsmanly virtues of fine painting. I have brought these things, therefore, into sharp relief and contrasted them with those more mental and contemplative qualities which form so constantly the motive, and the expression of which is so often an ingredient in a work of painting.

But though I have brought them into contrast to show that they are two entirely different things and to show you their respective values and places, do not run away with the idea that they are therefore incongruous qualities which in any sense exclude each other, or between which there is in the nature of things any inevitable jealousy or contradiction. Thank heaven that is not so. It is theoretically possible, no doubt, that these things should exist in entire separation and that the art of a Veronese (retaining all its splendour) should spend itself on mean and trivial things. But if you spend a half-hour in the Dutch room at the National Gallery and then walk into the Venetian room, you will not only feel that you are in the presence of a totally different and immeasurably higher skill of the human hand, but that the same transition has lifted you also into an incomparably more lofty mental atmosphere and that you are in the presence of a much finer manifestation of the human soul.

Now it would be impossible for me, even if I were a fine painter, to give you a demonstration of the qualities I have been speaking of in a short lecture, and by artificial light. But there are certain things which I can show you by way of illustrating the resources of painting.

Here are a series of tints. I am afraid you cannot see them to much purpose by this light, but at any rate you can see that there is a good deal of variety between them—that this one, for instance, might be called purple, and this orange; yet they are only the results of two different ways of using exactly the same pigments. You would think, if you know little of colours, that a colour diluted would always be a fainter version of itself, that a colour strengthened would always be a stronger version of itself, and that, indeed, is the rule in colours modified by mixture. But in fine painting colours are modified quite as much by superposition as by mixing; and that is the process I have here employed in its two great forms—glazing and scumbling. Glazing you will easily understand as the superposition of transparent colour; it is at the root of all Venetian excellence and brilliancy. Scumbling is an unfortunate word, which always sounds like a bit of artistic slang, and has therefore time out of mind been used in trivial literature as the cognomen for a typical painter—"Mr. Scumble, R.A."—yet it is a fine process, though the word is awkward, and he who knows how to use it is so far forth a painter in contradistinction to the man whose whole method of procedure consists, as in innumerable instances too modern to be quoted it does consist, in the mere mixing of colour together, and who is familiar to us all under the name which, with an innate sense of fitness, was poor Charles Kean's invariable pseudonym for a painter in the pages of *Punch*, "our old friend 'Stodge.'"

These, then, are all examples of the effects to be obtained by the varied handling of one colour (a very modest one, burnt umber) and white. This, which I have ventured to call purple, is white thinly scumbled over a dark space of burnt umber. This which I have called orange is the exact reverse, burnt umber thinly glazed over pure white. Those between are varieties of the same process in the degree of the thickness and darkness of the two colours used, and you must at once recognise the fact that, seeing that any one degree of the white

can be modified with the whole gamut of the umber, and any one degree of the umber by the whole gamut of the white, you are in the presence of a problem which is practically infinite; and when we consider this extended to the use of a full palette of pigments, we can understand that the choice of harmonies is as inexhaustible as in the case of music, and that a true colourist in the mere manipulation of his materials exercises the same kind of regal command over infinity as the composer of a fine sonata.

Having shown you how much can be done with simple means, I wish to insist upon the vital importance of working with simple means until their limits are reached. It is a very good thing to have perfect tools to work with, but you do not need me to tell you that a man who cannot do anything without extensive paraphernalia cannot do anything at all. This dependence upon lavish means is, however, such a pestilent disease in all the arts of the present day that I shall spend a few minutes in emphasising the value of their simplicity. And I cannot do so better than by trying to illustrate my point by reference to your own art. I am sure you will approve me when I make the reflection that a man who cannot build anything presentable in brick will not mend his case by falling back upon marble. On the contrary, while in the former his dullness, being unassuming, may escape censure, the presumption implied in his dealing with a noble thing will most justly call it down upon him. It is a characteristic of all great art that it exhausts the means used, and the more elaborate these are the greater the difficulty of the problem. Now nothing depends so little upon elaborate means as fine painting. Give a painter who knows his craft half a dozen brushes and half a dozen colours and the whole world is his own, while every fresh pigment added to the palette is a fresh danger and chance of failure. I remember some years ago in one of our exhibitions a case showing the development of a coloured illustration in either the *Illustrated London News* or *Graphic* in all its stages, there being, if I recollect right, fifteen or sixteen coloured stones employed. The drawing was a dashing, clever thing enough. It was called "United Service," and represented two handsome young fellows, in the dress, respectively, of the army and navy, escorting down the stair from the ball-room a young lady in white. The first few printings which showed the tints of the flesh and the delicate pencil-like marks of the shading had positively an air of great refinement. One thought the Caton Woodville or the Overend halfway towards being a Whistler, a "song in stone." The warm tones were printed first, and there were some delicate saffrons (azaleas and so forth on the stair), working up through the white to flesh colour. So far all went well, and though none of the printings after the first four or five did anything but harm, still the thing remained in a kind of key, and even the red of the soldier's coat, vulgar as it made the print look, did not render it positively unbearable; that was reserved for the blue-black of the naval uniform, which came crashing down upon the thing like a brass band out of tune, and sent one away saddened to look at the next inanity in the catalogue.

Now this contained a great lesson, and a most important one for you, gentlemen, for that simple palette which I have been advocating brings as its natural result work painted in a key. Look at much of Burne-Jones's work—those cartoons which he paints in brown and steely blue—at his pictures, too, in the same tones, of *The Annunciation*, *The Fortune*, *The Merlin*, and the series of the story of Perseus, and tell me if they are not noble colour. And in a more delicate and dainty key look at Whistler, with his nocturnes of blue and silver, grey and gold, or what not, and (if he has not shaken the dust of this ungrateful country from his feet for good), go next time he holds an exhibition and (and this will be coming near home to you indeed) see how he decks his room, working up from the white of his woodwork through the pale fawn or lilac of the matings and distemper, the cool, neutral metal of the picture-frames, which are neither silver nor gold, to perhaps some warm russet in the upholstery, and a sudden blaze of gold and crimson on a glowing screen.

There is nothing I should think more necessary for you architects to bear in mind in using painting in conjunction with your buildings than this question of working in a given key, and I purposely directed your attention at the outset to that particular picture of Veronese, because it is so beautiful an example of it. And that curiously because it is an unfinished picture. That lovely over-robe of Venetian red was doubtless meant to be glazed with luscious crimson, and I must not refrain from the temerity of recording my opinion that it is better without it, that even the great Venetians were mortal and sometimes revelled in the wealth of their means and splendour of their powers with a luxury too unrestrained. Certain I am that Tintoret for this reason comes to me with a deeper appeal than even Veronese, and that of the latter his unfinished pictures, this *St. Helena* and *The Annunciation* in the Accademia at (is it Florence or Venice?—the angel has red drapery like that of the *St. Helena*) and the noble pictures in the Ducal Palace, at Venice, where he keeps to a key of white

and gold, are to me his finest work. And whatever question there may be about that, I think there can be none of the fact that in nine cases out of ten they would serve the purposes of architecture better than those which look like a parterre of flowers. So remember, gentlemen (no doubt you will find it quite easy), next time some patron introduces you to his favourite R.A. to decorate the mansion or the church that you have built, tell him what keys of colour will harmonise with your intention, and what pigments he may use; remind him that you are the master of the situation and that he must do as he is told. You will get some valuable or, at any rate, emphatic information on the relationship between painting and architecture, with a good stout hook to hang it on.

I have now said all I can to direct your attention to what I will call the proper specialty of painting as a craft—that which belongs to it and to nothing else. I believe that it is the most necessary thing for you to know in starting your study of painting, and all the more so on account of that which I have alluded to as so encouraging a fact in the present day—that the arts are seeking to found themselves on the fine forms of craftsmanship proper to each rather than on academic theories and vague forms of dreaming.

The tendency of the arts at present, then, is to specialise themselves; but is their tendency also, then, on that account to isolate themselves? One would fear it might be, and perhaps a search through the world of modern art would afford us some ground for supposing that it is. But I am certain that that would be as nothing to the arguments, growing daily stronger and stronger, for the opposite conviction, which has been cheering the heart of every craftsman and art-worker in the kingdom during the last few years with ever-growing appeal—a conviction that, in the searching after the special and individual excellences of each craft, is being in reality rapidly discovered the proper ground on which they can all unite. You, gentlemen, by your study of the noble art which you have chosen to be your life's work, are preparing to stand in the place where, by the nature of things, all these various arts, which are so rapidly coming together, must meet. It will be your safest guide, I believe, in that perilous and responsible position, to remember that they meet there in virtue of their common motive, beauty, and that their common passport to that enchanted ground is craftsmanship.

This age has been too much swamped and stifled by academic methods of study, and it is certain that for a long time yet much instruction must be given in this way (what, indeed, am I doing at this moment?).

Yet, side by side with your lectures and treatises, take every chance that offers of learning at the bench or on the scaffold, at the anvil or at the easel. Where you see work going on ask technical questions, which will do good to him you ask as well as to you; and take every opportunity of getting at the actual tools and the actual stuff.

But "the bearings of these observations" (to quote the immortal Bunsby) "lays in the application on 'em." And now that I have tried to give you a general clue to the subject by establishing some first principle, let us turn our eyes upon the field of modern effort in painting, and try to find our way. And none too soon, for, gentlemen, you probably know—if not, I am happy to tell you—that cabinet pictures are a drug in the market, and you will very soon have all the jarring schools clamouring round you for employment. Indeed, if I live for another twenty years, I shall not be surprised to see—I shall expect to see—and, need I add, I shall most thankfully rejoice to see—architecture the acknowledged leader, ruler and guide of all the arts in this country.

Looking at modern painting we find two main schools, the poetic and the realistic. They are not necessarily in conflict, but the critics have determined to consider them so, and have so talked about them and egged them on that the painters themselves, I think, have got confused, and we must consider the schools as opposed.

Let me quote a few sentences from modern criticism. They shall all be from the same number of the same art magazine—the most recent one, and, therefore, presumably up to date. In the *Studio* for May 1893, you will find all the following passages:—"Complete mastery over materials is, after all, not everything; in fact, from the artistic point of view, work only begins then . . . unless the feeling is true, the work fails to interest us. Herein lies the whole question of artistic production."

Again, "The world is too big, too grand, too serious to be ruled by technique." So far the idealists.

Now hear the other side.

"This idea that genius is everything and execution nothing is screwed fast into the skull of every Englishman."

"How very strong is the desire for the ideal in this country, since not even ridicule can crush it. For in what other country would people have dared show their taste for art as the aesthetes have done here during the last few years? . . . But these aesthetes, of whom the undoubted head is Mr. Burne-Jones, have rendered great service to the art of their country. In the

search for their puerile puzzles they have, in making their way, endowed England with a decorating art." (Burne-Jones's puerile puzzles.) Again, "The more an artist relies upon the intelligent use of his pigment, to the exclusion of the literary interest, the more he will vex those who are unable to follow him."

Lastly, in order to see how this disdain of fine thought and beautiful intention in painting operates in actual work, I will turn to a letter which appears in the same number of the magazine, signed by a portrait of the writer.

He is in Spain, in a half-ruined ancient castle, occupied apparently by peasants, and writes as follows:—"While M. aired his Spanish with the last representative of the family, I made a sketch of the place, and as I was doing so a shepherd brought in a sheep. Tossing it backwards on a bottomless chair, he cut its throat, while a woman held a bowl to catch the blood, to the great delight of a child, who dabbled its hand in the warm fluid and crowed with glee. This would have made a picture; the tone and gloomy colour of the thing was mighty."

"This would have made a picture." In the Scuola de San Rocco, at Venice, the mightiest man that Venice ever bore, Tintoret, has painted the whole poem of suffering and sorrow and disease, in order to glorify by contrast and by conquest the heavenly art of healing: and to place an emphasis upon his message which shall make it knock upon the coldest heart and duldest mind, and force an entrance by shock and by horror, lest perchance the gate open not to natural gentleness and love, he has not shrunk back or stayed his hand from showing us a scene which well might challenge question; for foremost among those miseries who surround the pool of Siloam waiting for the descent of the healing angel, and for the moment monopolising the attention of Christ himself, is a group composed of a young woman, gloriously beautiful, but lying in the lap of an old hag whose expression of cold and distressed perplexity, rather than sympathy or love, proclaim her venal and contemptible, and who calls the attention of Christ to the sufferings of her charge, to which it is impossible to allude.

Why did Tintoret paint such a scene? Did he say to himself, "It will make a picture?"

I will tell you why he painted it, and if you know his work yourselves, its unvarying majesty and highmindedness, you will hardly call me to question. He painted it (and nothing but such motive would ever have induced him to paint it or tolerate it) with high moral and instructive purpose, to show, for instance, that the most degraded is not outside the love of God, that the most despairing is not to be despaired of; he painted it to bring hope back to the hopeless and shame back to the shameless, by showing that no depth to which we can sink can sink us below the notice and healing of Love, and that the eyes of the Divine Physician are turned towards us, and not from us, by the violence of our malady.

Whenever the great minds of the past have treated of such things, this is the temper in which they have done it. The greatest men of all have never turned towards the seamy side of our life, or the world's life, by a natural inclination and preference, and never present evil, suffering or disease to our view except with some strong didactic intention.

But it is not worth while to spend much time in warnings against ugliness. Very little of the arts which have been betrayed into the aberration of seeking it has stood the test of time, and in the main it is true that to name the great works is to name the beautiful ones. Still, it is as well to remind you that old forms of painting are being much challenged now; new forms are being started, and people are liable to be carried away by the new at any time as the only right thing, and afraid of being called "old-fashioned" and behind the age if they do not. There is a disposition to-day to regard the conquest of difficulty as the only thing worthy of men's admiration. It is true that, whenever a man has done a thing that was hard to do, he has done good to the world—set a good example. But the doing of a difficult thing is not the whole of art. It is difficult to win a race, to conquer in a prize-fight, to climb the Matterhorn, to construct the Channel Tunnel or to build the Forth Bridge. Why is not the Forth Bridge a work of architecture? It is the largest building in the world, and the greatest triumph over difficulty that the science of building has ever gained. Why is it not a work of art? Simply because it was built without a thought of beauty, and because it is not beautiful. Nor is a painting worthy of the name of art unless it fulfils these conditions.

But what, then, of Hogarth's works, for instance, or those of Teniers?

There is certainly no intention to be beautiful. Do I dare to say they are not art?

I must not in these days, amid such strong conflict of opinions, say anything so calculated to bring my words into contempt. There is a beauty in the actual craftsmanship and fineness of handling in these works that must make them respected—there is the conquest of great difficulty and the evidence of much self-discipline and severe training which

must make these things a useful and valuable lesson to humanity, and justify their claim to a place in the stream of our progress. But having said thus much, I will tell you plainly that, if it were possible to suppose that those men and others like them had it anywise in them to have spent such fine skill on objects in themselves gracious, then their spending them as they did was one of those countless instances of mistaken effort and misapplied power which through all the ages have at times filled the history of the world with waste and with regret; and I will also tell you this, that I believe if Phidias or Pericles could stand, say, before the *Marriage à la Mode*, they would turn away from it as a very strange thing to look upon and a thing full of wonder, but by no means the work of a man who was "in truth taught of the Muses."

I prefer, however, to consider by reference to more modern work the problems and questions that press upon us, so I will return to the sheep-slaughtering scene, which our Impressionist friend says "would have made a picture." I am sure he would have made a very clever picture of it; but let me point out to you two very important things; first, that the greatest leaders, even in that phase of art we are discussing, never give in their works any justification for that disregard of beauty in all else than technique which has been audaciously put forward by certain painters and critics. Who ever saw Whistler (who towers head and shoulders above the rest), who ever saw Corot indifferent to beauty of sentiment or of form? I would never be for supporting an argument by a mere appeal to great names, but until some man as great as these arises to paint the horrible and the base, we may well go on our way unshaken in our old-fashioned notions of art.

The other thing I had to say comes nearly home to you architects.

It is this, that it would have never become possible for our tourist in Spain to have uttered of the scene he described, "This would have made a picture," had it not been for the lamentable divorce between the sister arts which has left the cabinet picture to become the isolated and irresponsible thing that it has, and so to fall into the position of a work produced throughout with the fact constantly in the mind that it will have to make its first appeal, and the one on which its immediate success or failure depends; from the walls of a glaring gallery, where it must scramble and jostle for precedence in a spirit of most unworthy rivalry, and that its subsequent history must be to be made a mere movable, and thus sink into the position of a counter in the speculations of the market-rigging and conscienceless dealer. And I think it must be owing to this that many of our painters for years past have been tempted to seek after something that will startle rather than something that will charm. And the reason why I am "happy" to tell you of the decline of the cabinet picture is not my objection to cabinet pictures as such, but only to cabinet pictures as this spirit has at present made them. I said it was the divorce between the arts which has led to this, and I think if you consider you will find it true, for surely any man building his own house with that culture and refinement which would be implied by his being interested in its architecture would *ipso facto* be so far educated as to wish to have nothing there but what would be a permanent source of reasonable and dignified pleasure and strengthening and repose; but, alas! we live in other men's houses. We are always "moving," or contemplating moving, somewhere else, and really, with everything here to-day and gone to-morrow, we take our dose of pictures every spring in the public galleries, and do not pause to consider them as having any permanent place in our lives, do not look to them for beauty or for solace, if for a few moments they spur our jaded souls by curiosity, or horror, or excitement. It is for you to help us in these matters by taking a lively interest in the union of the arts in which lies all our future hope, and by showing us the possibility of surrounding ourselves with seemly and beautiful things generally, and thus make it impossible for the beautiful plant of art, which spreads abroad its branches and puts forth its leaves in splendid and varied crafts, to make its only failure in that which is the crown and flower of all, by painting, which so lamentably misses its mark.

In the commencement of my paper I used all my endeavour to get firmly fixed into your mind the idea of the painter's special craft—the technique which, to some painters of the present day, seems to be the one thing needful. I also declared my belief that it was needful, that no one without it could claim to be a great painter; but I have been in the latter part of my address to you dwelling on the value and dignity of those other elements of beauty which painting is so eminently well fitted to express, and to neglect which is to resign a portion of its crown; and you will find that painters, as a rule, have valued this skill (if they lived at a date at which it was possible for them to know of it) in proportion as they were seekers after beauty—Raphael more than Michel Angelo, Bellini more than Raphael. They "loved that beauty should go beautifully." So also they were the decorators, and if I name those who in these days come nearest to having that quality—Burne-Jones, Watts, Albert Moore, Leighton, Whistler—you see at once

that I name the very men amongst painters best fitted to associate themselves with your art in the capacity of decorators. For in truth they are the seekers after beauty. Others may wish to be historical or dramatic or pathetic or domestic or (God help us) comic in their painting; they are bent on being beautiful; they seek that first; all the rest may be "added unto it."

Forgive me for dwelling at such length upon this point, which should be one of the commonplaces of art; it is astonishing indeed that the utterance of such a rudimentary truth should be needed, but we cannot go through any gallery of modern pictures without seeing that it hardly enters into the popular mind of the present day that art has anything to do with beauty; far less that it has everything to do with it. I can hardly point this out more clearly than by reference to the collected works of two recently-deceased artists exhibited simultaneously a short time back. The one a popular favourite through the whole of his career, crowned almost at its commencement with full academic honours. The other almost universally ignored and neglected.

It is not necessary for me to recall the catalogues of these two exhibitions to your memory item by item; when I mention the names you cannot fail at once to recall the general impression that the first consisted of scenes of violence, conspiracy, personal combat, personal challenge, court intrigue and low comedy in trunk-hose, and that the latter was one harmonious procession of gracious form and colour; that one contained nothing that was markedly and intentionally beautiful, and the other nothing that was otherwise. Is it superfluous, then, in me to call attention to the most rudimentary definitions of the purpose of art in an age which so arranges itself that John Pettie should for twenty years have held a position in which it became his duty, from time to time, to give his voice in judgment upon the works of Albert Moore?

Nor can we console ourselves with the thought that it is only this particular nation and this particular age which has so erred.

It is a curious fact in the history of the human race that it is always liable to have the highest motives corrupted, and the most magnanimous temper spoiled by being confronted with actual achievement of any kind, in however undesirable a direction.

A nation penetrated and informed with the love of beauty, and doing everything beautifully for the sheer love of it, will turn its back upon itself in a moment and disdain its whole past, when accidentally brought into the presence of some new dexterity, even though exhibited in a field not worth cultivating. It will at once relinquish the pursuit of all that it was seeking, and despise all that it was producing to follow some skill, not one-tenth as fine as its own, but which challenges to a competition by its being new. It is hardly too much to say that the petty mechanisms and realisms of European work, aye, and third-rate Brummagem work at that, have in the last forty years destroyed the arts of the East. And I cannot resist concluding with an anecdote which has its humorous side and which brings out this truth into somewhat strong relief.

I was going through Italy some fifteen years ago, studying chiefly the art of the thirteenth and fourteenth century. I had with me as companions two younger men than myself, who were following with younger, but I think not stronger, enthusiasm the teaching of Ruskin. However, I was sufficiently older to manage my enthusiasms more cunningly, and the consequence was that I was always poking fun at the other two. However, one of them, a dear young Scotch architect, now, alas! no more, had all the caution and pawkins of his race, and would generally grasp the situation at once, and give me as good as I brought.

I had long recognised in the art of Giotto the intense struggle of the man, and how, with all his powers, he must have longed for powers beyond them to do the things he must have dimly imagined possible, but knew not how to set about. I had thought, and trembled to think, what might have been the result could he have been suddenly brought face to face with the clever realisms of modern art; and one day, standing before one of his frescoes, I turned to my companions and said, "Look here, you fellows, to put it shortly, if Giotto could have seen Frith's *Derby Day* he'd have gone into raptures." I forget what gesture of impatience my enthusiast friend made, but the Scotchman just leaned an inch towards me and replied as soberly, "P-r-robably have given it to Dante on his birthday." Well, gentlemen, I think we need not contemplate so exaggerated a catastrophe as that, for I think—upsetting as I am sure the experience would have been to Giotto—there is one thing that would have kept him right, his architectural sense; but for that I can easily imagine him so misled by the plausible dexterity of that celebrated work as to forget that it was not beautiful, but I think the union of the arts which was so happily embodied in him must have led him to distrust it at once because it was not decorative.

Do not imagine that all I mean by "decorative" is the art which is usually now alluded to under that name. All the

finest art is decorative; Veronese no less than Giotto, and what can be more reposeful and perfect and "liveable" than an eighteenth-century room, with the rich warmth of Reynolds and the serene grace of Gainsborough, amongst its slender mouldings and its dainty white and gold?

Don't, above all things, be narrow, or imagine that I want you to seek for art that is very flat, with a brown outline round the faces and with no shadows; but what I do urge you to seek for is art where beauty has been the aim before realism, glorious colour before deceptive light and shade, and graciousness and sweetness, and dignity and repose, before dramatic fervour, show, excitement and fuss.

It is the cultivation of this temper in you architects that forms the one hope of us painters who, disgusted with the frivolity and ugliness of the bulk of modern work, have been struggling along the despised and neglected path of decorative art.

Upon you falls the honourable (but responsible) task of directing the accessory arts, and it is with a real joy that we see so many of you now seriously setting yourselves to learn them. You will find in doing so, even if you learn but one of them, the grounds for a sympathy with your brothers in art, to which you have hitherto been strangers, and by virtue of which you will find them working with you rather than for you, with the enthusiasm and joy which ever comes with sympathy. And depend upon it, when masonry, when timber and glass and metal and mosaic and sculpture and painting are each advanced to their own proper perfection and completion, and when, being so, they are brought under the direction of a master builder whose knowledge of and sympathy with their various excellences has largely helped to make them what they are, we shall soon cease to hear complaints that we have "no style," for, if once the various crafts were used in perfection and used in association, they would soon form their own right style, and being used in sympathy also, the characters which would be stamped upon each one, by virtue of its own perfect craftsmanship, would combine to form one harmonious style for the whole range of the arts.

I have thus endeavoured to make clear to you what I consider the great essentials of painting as an art, and the essentials of its relation to architecture. The two questions are almost inseparable and quite interdependent.

The doing well of what we have to do, the perfect and right use of our tools and our stuff, is the simple ground on which these arts meet—they can't come together at all except by the humility and common-sense reasonableness of that first step; but this once taken they can, hand-in-hand, pursue their common aim, and that aim is beauty. And in the pursuit of beauty they gain strength from each other, for all their past history shows that they have ever sought it most successfully when they have sought it in common; and I venture to think that, speaking generally, their past history also shows that the arts have ever attained the highest perfection of all when, even beyond the attainment of physical beauty, they recognised yet another motive still and referred all their efforts to the standard of a high and noble conception of the whole of human life, domestic, civic, patriotic and religious, in its completeness and its dignity.

You builders of our temples and our halls and our homes, you students of our ancient glories, help us to recover that lost inheritance. When you apply to us to join with you in your efforts, do so in this spirit, and let us together apply whatever we can win back of the felicities and dexterities of our noble arts in portrayal of things worthy of them—the great verities of life and being; in the reiteration of the unchanging voice of human aspiration, the affections of the heart that never grow cold, the thoughts that never die.

A vote of thanks was carried by acclamation to Mr. Whall for his lecture, and the proceedings terminated.

THE ART OF CASTING BRONZE IN JAPAN.*

THE art of casting bronze has been practised by almost all nations from very early times. In Europe, at a remote period, long before the dawn of history, we have numerous examples of the skill of primitive man as a founder of bronze. Weapons of defence and implements of the chase are the chief specimens of his earliest work; but later, when other wants arose beyond the bare necessities for his existence, we find, together with these, objects for personal adornment and domestic or ceremonial uses.

In Asia, the earliest practice of the art is shrouded in the mists of extreme antiquity. Certain bronze figures from Chaldæa are attributed to a period not later than 2,000 B.C., and although of very archaic form and rude execution, indicate

that the casting of bronze must have been followed in that country, even for many centuries before that remote date.

In Japan the founder's art has a much less antiquity; it does not extend back to these periods; in fact no remains of any metal castings, even of weapons of defence, have been found there, approaching in age even those of the early bronze period in Europe.

The Japanese do not appear to have migrated to the islands they now occupy earlier than perhaps seven or eight centuries B.C., and the aborigines whom they found there were totally unacquainted with the use of metals. Hence all objects of metal which have been discovered are Japanese, and are not older than that time.

The evidence afforded by tumuli and dolmens and the remains found in them of the early history and civilisation of the Japanese, demonstrates clearly that in prehistoric times there were two periods, which are more or less clearly defined by the progress which they made in the art of metallurgy, viz. a bronze and an iron age. The bronze age begins with the immigration of the race, and terminates about the second century B.C. The iron age then commences and extends to the present time.

It is worthy of note here that the bronze age and the first period of the iron age are also characterised by two distinct forms of sepulchral monuments, the former by barrows or simple mounds of earth, and the latter by megalithic dolmens and highly-specialised forms of chambered tumuli. There is no evidence whatever of a copper age preceding that of bronze, but contemporaneous with the early iron age, and up to the sixth or seventh centuries A.D., we find copper in more extensive use than bronze. Iron swords, trappings and bits for horses, decorated with thin sheets of copper coated with gold, are found in abundance, whilst objects of bronze are rare.

The Bronze Age.

The castings which represent the early bronze age in Japan consist solely of swords and arrowheads, the wants of the people then being evidently few and simple, and although objects for personal adornment were in use they were made exclusively of steatite, jasper, quartz or other stones. The swords are found in barrows or merely buried in the ground, and never along with objects of iron; the arrowheads, on the other hand, occasionally occur also in dolmens, associated with iron swords, and thus connect the bronze with the iron age. These bronze swords are undoubtedly the most ancient castings in Japan. They are simple two-edged weapons, resembling in form the short sword of the ancient Greeks. In some examples the blade is cast in one piece with the hilt, but in others with a tang, to which a hilt was subsequently attached. The mould was of stone, and was made in two pieces. This is the oldest mould for casting bronze in existence in Japan. It was found by a Japanese archæologist in use by some farmers as a hone for sharpening their sickles.

I was unable to obtain any fragments or even scrapings of these swords for analysis as there are but few existing, and they are highly prized, but a fragment of an arrowhead which I examined consisted of copper and tin, and did not contain lead as an essential constituent, and the swords are probably of the same alloy.

Early Iron Age (from about Second Century B.C. to about Sixth Century A.D.).

In my explorations and studies of the remains which occur in the ancient Japanese dolmens and chambered tumuli, I have always observed a marked scarcity of castings of bronze. Circular mirrors, small bells and arrowheads occasionally are found, but they form an insignificant part of the contents of a dolmen, the chief objects being swords, arrow and spearheads, horse furniture and other articles of iron, many of which are plated with thin sheets of copper, coated generally with gold and sometimes with silver. The bells, which are of the form called by the Japanese "suzu," are simple hollow spheres with a slit cut in the lower half, and contain a loose piece of metal or a small round pebble to serve the purpose of a tongue. They rarely occur singly, but are usually cast in groups on the edges of a flat support furnished with a hole and tang for attachment probably to a staff, or in some cases to the trappings of a horse; they appear also to have been used as ornamental appendages to garments and the hilts of swords.

The largest castings of the early iron age are curious bell-shaped objects which are of special interest from their form and archaic ornament. It has been conjectured that they are temple bells, but they present no points of resemblance to these or to any instrument or object connected with the ceremonies or observances of Buddhism, and are, in fact, of earlier date than the introduction of that religion into the country. Moreover, none show any signs of having been hung. A considerable number have been found—always buried in the ground—chiefly in Yamato, Kawachi, Totomi and the neighbouring provinces.

As early as 669 A.D. the discovery of one is recorded, and

* A paper by Mr. W. Gowland, A.R.S.M., F.C.S., F.S.A., late of the Imperial Japanese Mint, read before the Applied Art Section of the Society of Arts on Tuesday, April 23, 1895.

this was even then regarded as being of such a great antiquity that it was presented to the Emperor. The designs with which they are ornamented—the simple geometric line patterns common to many primitive races—are also evidences of their great age. They vary in dimensions from 1 or 2 inches to 5½ feet in height, those measuring 1 foot 6 inches to 3 feet being most common, and all are of extreme thinness compared with their size. Their exact use is still a subject of dispute among archaeologists.

Seventh and Eighth Centuries.

Two events of marked importance in Japanese annals, on account of their influence on the development of the arts and culture, occurred during this period. Buddhism, which had been introduced about 552 A.D., had been adopted as the religion of the country through the energy and enthusiasm of Prince Shotoku Taishai (593-621 A.D.), and a fixed capital and court had, for the first time in Japanese history, been established at Nara (709 A.D.). These two centuries form a brilliant epoch in the history of the art of bronze-founding, as in that of the sister arts of painting and sculpture. Numerous temples, some on a scale of great magnificence, were erected for the services of the new religion, and the skill of both native and foreign workers in bronze was specially enlisted for their decoration, as well as for the production of statues of the divinities of Buddhism and of vessels for the ceremonies of its ritual.

Stimulated and supported by the priesthood in their efforts to produce objects worthy of the services of the church, the bronze-founders achieved results in those early times which have not since been surpassed. Unfortunately, many of their works have been destroyed by conflagrations and in the frequent spoliation of the temples during civil wars, but a few have been preserved which are masterpieces of the art of the modeller and founder.

Many tales record the enthusiasm with which the founders of the time were supported by their patrons, and of the stubborn manner in which, after many repeated failures, they overcame the difficulties which beset them. The Empress Hoken (749-58) herself is said to have aided the founders in stirring the molten metal for a statue of a Buddhist saint, which was only completed after six unsuccessful attempts. The development of bronze-founding, and the encouragement of its artists, during this period was entirely due to Buddhism, and even for many centuries later the chief works of the art founders were executed for the adornment of its shrines. The survival of most of the older bronzes is also solely due to the ease with which they have been preserved in temples and monasteries by the priests of that religion.

Japanese records and traditions relating to the works of art of this epoch, whether of the painter, sculptor, or founder, invariably speak of the help afforded in their production by Korean or Chinese artists, and not a few of the ancient examples which survive are even attributed solely to them.

It is very difficult to determine how far these traditions relating to Korean artists are trustworthy, as no traces of similar works have been found in Korea itself; yet they all present such a close agreement on the point that we are almost compelled to acknowledge that if not perhaps true in the details they give of individual artists, yet broadly speaking they may be based on facts; and that the Japanese owe to Koreans, or probably rather to Chinese who may have come through Korea, the first great advances which they made in the casting of bronze.

Besides the influence which the neighbouring countries—China and Korea—had on the technique and motives of the Japanese bronze-founder, we have also abundant evidence of the influence of the art of more distant regions. Amongst the treasures of the temple Horiuji (near Nara Yamato) are several Indian statues in bronze of Buddhist saints and deities, and a curious ewer, which are said to have been in the possession of the temple from the date of its erection in the early part of the seventh century. The characteristic pose of the figures, the modelling of their features and their jewelled headdresses, have been frequently copied, with more or less modification, and can be distinctly traced in many ancient Japanese statues, as well as in some of comparatively modern times.

During this epoch, especially that part of it which has been styled the "Nara period" (the seven reigns during which Nara was the capital, 709-84), the great development in bronze-founding was not the only advance made in the working of metals; but the art of incised *repoussé* work in gilt copper, which had been practised during the early iron age, was brought to a stage of perfection beyond which it has never passed.

From the Beginning of the Ninth to the End of the Twelfth Century.

Near the close of the preceding epoch the court was removed to the city of Kyoto, which from that time (794 A.D.) up to 1868 continued to be the imperial capital. This removal of the court was a severe blow to the art life of the ancient city, and the works and traditions of its old bronze-founders soon

appear to have been forgotten or neglected in the new metropolis.

From the beginning of the ninth until near the end of the twelfth century, a space of nearly 400 years, we have a period of stagnation, if not of decadence, in all art, yet, strange to say, it embraces the golden age of literature, during which the famous classical romances were written. Its first half, as shown by these romances, was marked by effeminacy; during its second the country was plunged in civil war. The romances give us but little information of the individual and art life of the people, and the pages of its histories are solely devoted to records of the jealousies and feuds of the great families of Fujiwara, Faira and Minamoto.

Until near its termination we have no record of the erection of any temple of note or of the execution of any great art work, and I have been unable to find any examples of the art of the bronze-founder during the entire period, excepting two insignificant boxes for holding seals (dated respectively 998 and 1098 A.D.), and nine distinct coinages of bronze money (from 810 to 958 A.D.). After this last date even the coinage of money appears to cease, and is not resumed until 1457 A.D.—500 years afterwards.

Thirteenth Century.

During the last years of the twelfth century, when peace was established throughout the country by the victories of Yoritomo, there are the first signs of a revival of the old art of the Nara period. From 1190 A.D. up to the date of his death (1198 A.D.) this remarkable warrior devoted all his energies to the cultivation and advancement of the arts of peace. Stimulated by his example and enthusiasm, the artistic spirit of the people was aroused from its dormant condition, and for nearly a hundred years we have a notable period of renaissance in art—a period chiefly remarkable in the history of bronze for the casting of that magnificent masterpiece, the colossal image of Amitabha, usually called the Daibutsu of Kamakura. This image, one of the finest examples of bronze-founding, cannot be adequately described by any word painting; it must be actually seen in the midst of its grove of conifers and evergreens to appreciate fully its grandeur and beauty, its soberness of design and noble expression of majesty and repose. It stands alone and incomparable among all the *chefs-d'œuvre* of Japanese bronze-founders.

Other bronze images of the divinities of the Buddhist hierarchy, of less colossal proportions and of varying degrees of excellence, were made for the temples of Yamato and Kyoto, one of the chief groups being a Trinity for the ancient monastery at Horiuji. Several bells were also cast, one at Kamakura being worthy of note, as the record given of it indicates the source of the metal from which they were occasionally made. It is said that 300,000 copper coins, which had been collected by the priests of the temple, were melted down for casting it, and the metal being insufficient, the casting was a failure; 30,000 more coins were then collected for addition to the defective bell when it was remelted. It is also recorded that copper coins were similarly melted up for casting Buddhist images and ornamental utensils, hence it would appear that it was not then deemed necessary to use a different alloy for bells and art castings than for coins.

Fourteenth and Fifteenth Centuries.

During the fourteenth and fifteenth centuries we have again a period of decadence, with the exception of two short brilliant intervals, the first during the supremacy of the Ashikaga Shogun, Yoshimitsu (1368-93 A.D.), and the second during that of Ashikaga Yoshimasa (1449-71 A.D.). For the greater part of this period the country was again in a state of unrest and intestine conflict, and the arts of peace found but little encouragement, excepting so far as they contributed to the needs of war.

Workers in iron are brilliantly represented by one of the greatest of the famous forgers of sword blades, Masamune, and by several distinguished armourers and smiths of the renowned Mio-chin family; but the bronze-founder was not in request. His chief work during these two centuries was a colossal figure of the Buddha Vairochanay, cast during the time of Yoshimasa for the temple at Hase (Kamakura). I have not seen this image, but it is said to be an admirable casting and to measure 30 feet 6 inches in height.

Sixteenth Century.

In the last decade of this century, after another period of civil war, the patron of art and culture is again a famous warrior, Hideyoshi (often known as Taiko Sama). Although then engaged in war with Korea, the closing years of his life were devoted to peaceful pursuits at home, and in imitation of Yoritomo at Kamakura, he erected a huge Buddha and a temple to contain it at Kyoto. On the destruction of the image, which was of wood, by an earthquake only eight years after its erection, he contemplated replacing it by one of bronze; but the execution of this was delayed by his death (A.D. 1598), and was only accomplished by his son and widow

sixteen years afterwards. No large bronzes of importance appear to have been cast during this century.

Seventeenth Century and First Half of the Eighteenth.

In 1603 Tokugawa Iyeyasu, a man of remarkable ability, both as a warrior and a statesman, succeeded to the Shogunate, and by his wisdom and foresight established on firm foundations the Japanese system of feudalism, which, under the rule of his successors, gave absolute peace to the country for more than two and a half centuries, and resulted in an advance and development of the arts unparalleled in any previous age.

During the supremacy of these Tokugawa Shoguns the painter, the lacquerer, the potter and the founder were encouraged and stimulated as they had never been before to bring their respective arts to the highest point of excellence, and it is in no small degree owing to the works which they produced during this period that Japan owes the prominent position which she now so deservedly occupies in the world of art.

The first great works of the bronze-founders of the seventeenth century were a colossal figure of the Buddhist divinity Rochana in Kyoto, to replace the wooden image destroyed by an earthquake in the previous century, and a huge bell for its temple.

The figure is said to have been 58½ feet high, and from the records regarding the first attempt to cast it, it would appear that it was cast *in situ* and in segments, the mould being built up on the parts already finished. It would thus, when completed, have been practically a single piece of metal. This attempt was a failure, as when casting the lower part of the head, the wooden scaffolding was set on fire by the operations, and the image partly melted. It was successfully completed in 1614, but only forty-eight years afterwards, like its wooden predecessor, it was destroyed by an earthquake. According to official records, its fragments were melted in 1668-83, and cast into the bronze coins (Kwan-ei-tsu-ho) then current.*

This record is interesting, as it affords another proof that the alloy used by bronze-founders did not differ much in composition, if at all, from that in use at the time in the mints for coins. I have analysed these coins with the following results:— Individual coins differed considerably from one another in composition, the percentage of copper present varying from 69.8 to 86.8, a variation not greater, however, than might be expected from the nature of the alloy and the mode in which it was cast. Hence, in order to ascertain their average composition, 7,600 pieces were melted together, and the resulting metal was analysed, and found to consist of—

	Per cent.
Copper	77.30
Tin	4.32
Lead	15.33
Arsenic	1.14
Antimony	0.31
Zinc	nil
Iron	1.01
Silver	0.06
Sulphur	0.52
Gold	trace
	99.99

We may hence not unreasonably conclude that this represents, approximately, the composition of the alloy which was used for casting the colossal Buddha.

The casting of a large bell in old times in Japan was an important event and was accompanied by religious ceremonies and popular rejoicings. On the day appointed for running the metal into the mould a grand festival was held at the temple, in the grounds of which the founding operations were performed, and people of all ranks came from far and near with contributions, many with offerings of mirrors, hair-pins and metal ornaments to be added to the bronze in the furnaces. On one occasion, that of the founding of the great bell of Zo-jo-ji, the Shogun himself (Iye-mitsu) was not only present, but took part in the direction of the operations. In succeeding years the day was not forgotten, but its anniversary was celebrated by temple feasts.

The fame and repute of this "golden" period in the bronze-founder's art does not however rest on the above castings, which are chiefly remarkable for their size and weight, but on those now to be described, many of which are masterpieces of design, modelling and technical skill.

The oldest of these are the bronzes cast for the mortuary chapels and tombs of the early Tokugawa Shoguns and members of their families. At the famous mausoleum at Nikko there are some grand examples, one of the most notable being the tomb of Iyeyasu (the first Tokugawa Shogun, died 1604 A.D.), a fine casting in bronze, with bronze gates, distinguished by impressive simplicity and chasteness of design. In front of

the tomb are the three ceremonial ornaments (Sangusoku) of the Buddhist altar, viz. a vase, incense-burner and candlestick, all of the severe style of the period. The gates are splendid examples of bronze-founding. Almost their whole surface is covered with delicate diaper and floral patterns, upon which ground the bolder ornamentation is moulded in relief. These consist of representations of the "chakra," or Buddhist wheel of the law, and floral designs, most of which are coated with gold. In front are the two fabulous animals (Koma-inu and Ama-inu) supposed to represent lions.

The tomb of Iyemitsu (third Tokugawa Shogun, died 1649 A.D.) closely resembles that of Iyeyasu in form, but the reliefs on its bronze gates are simply Sanscrit characters in medallions. These tombs are situated in a grove behind the chapels and oratory, and their simplicity presents a striking contrast to the magnificence of these edifices, which are the most richly decorated shrines in the world. It is said that their plain and simple design is intended as a concrete expression of the Buddhist aphorism that "at death there is an end to all magnificence."

Numerous large standard lanterns (toro) of bronze, contributed by the territorial nobles, who vied with one another in thus doing honour to their departed chiefs, line the courtyards of the shrines. Many hundreds of these "toro," which were favourite votive offerings of the wealthy both to Buddhist temples and Shinto shrines, were cast during this period of revival in bronze-founding. They adorn the approaches and grounds of every temple of note in the country, those of Zo-jo-ji (Tokyo) alone number more than 200.*

Each group or pair differs from any other, yet in outline and decoration all are in harmony; and if no other examples of bronze-founding were in existence, the gracefulness of form and fertility of design which characterises all would alone mark their modellers and founders as artists of the first rank. It will be noticed that both of these, although of the same general form, differ entirely in decoration.

The mausolea of other Tokugawa Shoguns also afford some fine examples of the bronze-founder's art, notably the tombs of Iye-tsana (1650-80), and Tsunayoshi (1681-1708), at Uyeno (Tokyo), and of Iye-nobu (1709-12), at Shiba (Tokyo). They are of similar form to those at Nikko, differing from them chiefly in the more elaborate decoration of their gates. Finely-modelled dragons, and the armorial badge of the Tokugawas, ornament the gates of Iye-nobu's tomb, whilst in the tomb of Tsunayoshi—who was a noted patron of art—there is still a further departure from the simple style of earlier times, the symbolical combinations of the fabulous unicorn (Hirin) and pine-tree, the phoenix (Hoo) and paulownia, and of the pine, bamboo and plum being perhaps almost too lavishly employed.

Another important bronze at Nikko representative of the period is a bronze column (1643 A.D.), termed So-rin-to, 42 feet in height, a form of the Indian "stupa," as introduced into Japan through China. Before removal to its present site it stood near the tomb of Iyeyasu, and was doubtless erected there in accordance with the Chinese superstitious beliefs in the efficacy of such structures in warding off evil influences and insuring the protection of heaven. Besides these, four huge lotus petals, for the base of the image of the Daibutsu at Kamakura, were cast at the beginning of the eighteenth century (1717).

From the Middle of the Eighteenth Century up to the Present Time.

Hitherto the skill of the bronze-founders had been chiefly exerted in the production of colossal images and other huge castings for the Temple of Buddha, and in giving a severe beauty to the forms and ornaments of utensils and implements for ceremonial purposes, but during this period, with the continuation of peace, their art found a wider range in the designing of objects for secular use for the decoration of the home and the everyday needs of life.

Shortly before, the okimono, or ornament, a thing of no practical utility, but only of display, had been introduced, and this specially opened up to the artist a rich and unlimited field for the exercise of his ingenuity and skill in the art of ornament and design. The vase, too, formerly used only as a ceremonial vessel of the Buddhist altar, now became a necessary object for the adornment of private life, and in its form and decoration the artist was no longer hampered by the old traditions and rules of the church. The founders of this period hence are not chiefly notable, as in earlier times, for the works destined for the services of Buddhism or the embellishment of its shrines, although many remarkable castings were made, principally standard lanterns, dedicated as votive offerings to temples and monasteries, and torii, or gateways of Shinto shrines, but owe their world-wide fame to the skill and fertility of design exhibited in the objects above mentioned for household use, many of which are masterpieces of form and ornament.

* There is another record of the conversion of Buddhist statues into coins in 1450-70.

* Presented to the Shoguns Iyetsugu (1716) and Iye-shige (1762) by the territorial nobility.

The period is also marked by an important naturalistic movement in the schools of both pictorial and glyptic art.

They had up to this time followed the older men in basing their designs on the traditions of Buddhism and the forms and motives of Chinese and occasionally of Indian art, but now they began to break away from the trammels by which they were bound to these old conventional forms and motives and go to nature for their inspirations and models.

It should, however, be remembered that much as the works, especially of Chinese artists, were admired, mere slavish copies were never or rarely made of them; thus in the bronzes even of the early days, the figures of Buddhist divinities, there is a serenity of expression and graceful arrangement of drapery which we look for in vain in the masterpieces of Chinese art. Nearly contemporaneous with the establishment of the Shijorui—the school of naturalistic painting—in Kyoto, by the famous painter Kyo, we find the art-founders adopting these new motives and new modes of representing the old. Stiff geometric designs give place to those based on natural forms, and even in representations of the mythical dragon we see, as has been pointed out by Professor Anderson, “distinct evidences of direct study of snake form.”

Studies of natural objects, of plant and animal life, were now made, the designs of the naturalistic painters were followed, and an impulse was given to the art of bronze-founding greater than had been known since the Nara period.

(To be continued.)

MANCHESTER SOCIETY OF ARCHITECTS.

AT the annual general meeting of the Manchester Society the following members were elected as officers and council for the coming session:—

President: John Holden. *Vice-Presidents:* John Ely, R. Knill-Freeman. *Hon. Secretary:* Paul Ogden. *Assistant Hon. Sec.:* Edward Hewitt. *Members of Council:* R. I. Bennett, A. H. Davies-Colley, T. Chadwick, R. Knill-Freeman, F. Mee, J. D. Mould, W. A. Royle, E. Salomons, J. H. Woodhouse, T. Worthington. *Members of Council-Associates:* J. S. Hodgson, H. E. Stelfox, P. S. Worthington. *Auditors:* J. W. Beaumont, C. H. Heathcote. *Education in Architecture Committee:* A. H. Davies-Colley, John Ely, F. Mee, J. D. Mould, G. H. Willoughby, J. H. Woodhouse, P. E. Barker, G. Brown, P. Hesketh, J. S. Hodgson, H. E. Stelfox, P. S. Worthington.

Mr. C. R. Locke, Mr. Joseph Nodal and Mr. Joseph Swarbrick were elected fellows, and Mr. C. B. Rochester and Mr. F. J. Almond were elected associates of the Society.

The annual report referred to two deaths among the members, the first being that of one of the best and trusted friends of the Society, Mr. James Murgatroyd, he having been one of the founders in 1865, and since that time one of its most energetic and valued members.

The late James Murgatroyd, architect and surveyor, of Manchester, a member of perhaps the oldest firm of architects in that district, was born in Ardwick, Manchester, on January 3, 1830, and was consequently within a few days of being sixty-five years of age at the time of his death. As a boy he was educated at the Chorlton High School, on leaving which he was sent to the Handel Schule, Leipzig, where he became a great favourite with the masters, particularly with the architectural master, as he at an early age developed that taste for the profession which he afterwards followed so successfully. After leaving Leipzig he returned home and commenced his business career. He at once obtained a seat in the office of Mr. Alexander W. Mills, who was then a rising architect in Manchester, and to whom his parents were known, and a very close intimacy then commenced between master and pupil, which continued without intermission up to the day of his death. At the termination of his articles he, by the advice of his friend and master, Mr. Mills, travelled for a couple of years on the Continent. On his return he contemplated commencing practice on his own account, but ultimately joined his old master, and in 1853 the firm, originally “Alexander W. Mills,” became “Mills & Murgatroyd,” the partnership thus commenced terminating in 1881.

The business, which was established by Mr. Mills in 1838, had already at the date of the partnership attained considerable importance; and amongst other works in hand at that time was the extension of the Exchange Building in Manchester, afterwards, by letters patent, the Royal Exchange, and in this work particularly he as a young man took a lively and active interest, as also in the subsequent works connected with the alteration and the reconstruction in or about the year 1860. Many important works were carried out by the firm, that very deservedly secured a considerable share of the work in and about Manchester. The joint station of the London and North-Western and the Manchester, Sheffield and Lincolnshire Railways at London Road was perhaps one of the most important buildings erected by it; also the extensive buildings belonging to the Poor Law Guardians of the township of Manchester.

The Manchester Grammar School, with its very complete gymnasium; the High School for Girls, and the large building erected originally for a warehouse, and now known as the Grand Hotel; the Manchester and County Bank, and most of its branches in the surrounding towns, were also erected by the firm. Personally, the two partners seemed made for each other; at no time during their business relations was there any difference between them, and the partnership was terminated in 1881 simply by the elder, as it were, putting on his hat and leaving the office to the young partner—a very rare occurrence, but one particularly showing the strong affection and confidence which existed between the partners.

Murgatroyd's continental education and travels gave him considerable advantages, as he could converse fluently in German and French, and almost as well in Italian. His knowledge of mathematics was considerable. He was always greatly interested in educational matters connected with the profession, and was for many years actively engaged in the management of the school of art and the technical schools, and was one of the committee appointed by the Corporation to visit the Continent for the purpose of collecting information preparatory to arranging for the building of the extensive technical schools which will shortly be commenced in Manchester.

For many years past Murgatroyd was largely engaged in valuing properties, more particularly in connection with the city improvements. He acted as umpire or arbitrator in a considerable number of disputed cases, in which his clearness of judgment was invaluable. He was a Fellow of the Institute, having been elected in 1877, and one of the founders in 1865 of the Manchester Society of Architects, of which body he was twice President, and he may be said to have been one of its mainstays. His circle of business friends was very large. He was well known for his strict integrity, and was trusted by every one with whom he came in contact.

The Society also regrets the death of Mr. Laurence Booth. Owing to failing health for the past year or two he had not been able to attend the meetings regularly, nor had he been able to devote himself so earnestly to the work of the reconstructed Society as he did to the work of the Manchester Architectural Association, now happily merged in the present Society. For two years he was the President of the late Architectural Association, and many will remember with feelings of gratitude the good work he did in promoting the interests of the members, and especially the junior members, during his occupancy of that presidential chair.

GENERAL.

The Eden Theatre, Paris, is being demolished, with some adjoining houses. The ground will be laid out for building sites in connection with a new street which is about to be formed.

The Congress of the Société Française d'Archéologie will be held at Clermont-Ferrand from the 5th to the 13th June. There will be several excursions to places of interest.

An Exhibition of works by Corot, the French painter, will be opened in Paris, probably in the Musée Galliera, in June. The memorial of the artist to be erected in the Parc Monceau will be inaugurated in July 1896.

M. Charles Garnier has completed his article “Façade” for the Dictionary of the Académie des Beaux-Arts.

Mr. C. J. Phipps, F.S.A., is preparing plans for the conversion of the Queen's Hall, Reading, into a theatre, which will be arranged for about 1,700 seats.

A Memorial Cross of a Celtic type, about 12 feet high, has been executed in Scotland, and sent to Chicago for erection at the grave of the late John W. Root, the architect.

Wednesday, May 8, has been appointed for the reception of works of art intended for the Summer Exhibition (the thirty-fourth) of the Nineteenth Century Art Society, at the Conduit Street Galleries.

A Marquis of Argyle Memorial is to be erected in St. Giles's Cathedral, Edinburgh. The cost will be over 1,000l., Messrs. Mitchell & Wilson being the architects.

Mr. Charles Mason, surveyor to the Vestry of St. Martin-in-the-Fields, will read a paper on “Street Subways for Large Towns” at the meeting of the Society of Engineers on Monday, the 6th inst.

An Anonymous Benefactor has presented to the Liverpool Corporation over a hundred acres of land in the Wavertree district, for a public recreation-ground.

The Berlin Art Exhibition has been formally opened by Dr. Brose, Minister of Public Instruction.

An Art Union is to be established in connection with the Earls Court Exhibition. It is proposed to expend 15 per cent. of the amount paid for season tickets in the purchase of works of art. The lottery will be confined to holders of season tickets.

The Architect.

THE WEEK.

SIR JOHN MILLAIS was true to himself in officiating as chairman at the Academy banquet. He has devoted his life to his art, and it was more worthy of so long and successful a career to refrain from the slightest display of versatility. In his little speeches, as in his pictures, he endeavoured to be faithful to facts. His manner of persuading the guests to accept the toasts was by explaining his own associations with them. He related how the Prince of WALES at his suggestion took the chair at the first dinner of the Artists' Orphan Fund, and in consequence the large sum of 16,000*l.* was obtained. The Duke of EDINBURGH the next year, on Sir JOHN'S appeal, became chairman, and the fund gained 6,000*l.* "The Army, Navy and Reserve Forces" brought up the reminiscence that the adoption of a grey uniform for the Artists' Corps was discussed in Sir JOHN'S studio in Langham Place. "Her Majesty's Ministers" recalled the fact that the chairman had painted portraits of most of the illustrious statesmen of his time, and "Music and the Drama" that he had composers and actors among his sitters. In the response for the Academy Sir JOHN naturally dwelt upon his connection with it since his eleventh year, when he entered as a probationer, and warmly declared that he loved everything belonging to it, the casts he had copied, the books he consulted, the very benches he sat on. All this egotism was honourable. It was the simplest expression of the feelings of a man who found himself in a difficult position. An inferior artist would have tried to look at the topics abstractedly, and imagine he was likely to become eloquent by that arrangement. Sir JOHN MILLAIS was more wise when he described those views which had become most familiar to him. It is only to be regretted that personal recollections cannot be repeated should another occasion arise.

THE decision which was given by Mr. Justice VAUGHAN WILLIAMS on the 3rd inst. in the action HERRING v. Trustee of Marriage is of great importance to quantity surveyors. The point was how far the payment of surveyors' fees was affected by the bankruptcy of a builder. His lordship did not attach much importance as to whether the quantities were part of the contract or not in the event of the builder becoming bankrupt, and held that the quantity surveyor must take a dividend in spite of the facts that the architect had instructed the builder to pay the fees only upon the order of the architect, and that there was a clause in the contract that "All amounts for special purposes were to be provisional, whether so specially mentioned or not, and were to be deducted in whole or part, if not required," and that the architect had given separate certificates for the amounts due to the contractor and for the quantity surveyor. The effect of the decision will be to place quantity surveyors in the same category as ordinary traders. The former are not able to provide for contingencies of failure, while part of a trader's business is to make provision of that kind. The case deserves more attention, and the Surveyors' Institute, that ought to give more attention to subjects that are not connected with estate management, should take steps for that purpose. Unless we are mistaken, the decision will make others suffer besides quantity surveyors.

THE Technical Instruction Committee of the Borough of Crewe invited the following architects to send in competition designs for their new buildings, viz., Messrs. J. W. BEAUMONT, G. E. BOLSHAW, CHAPMAN & SNAPE, FORD & SLATER, J. LANE FOX, J. D. MOULD, JAMES STEVENS, WOODHOUSE & POTTS, and WOODHOUSE & WILLOUGHBY. Messrs. W. SUGDEN & SON, Leek, were appointed assessors. They placed first the design numbered 7, and this decision has been accepted by the committee. When the sealed envelopes were opened the author was found to be JAMES STEVENS, F.R.I.B.A., 88 Morley Street, Manchester.

THE following resolution was adopted at the meeting of the Association of School Boards in the Westminster Town Hall, on Wednesday:—"That in view of the difficulty in obtaining suitable sites for School Boards' buildings, consequent upon the present unsatisfactory state of the law regarding the compulsory purchase of land by School Boards, which frequently results in exorbitant prices having to be paid for eligible sites, this association is of opinion that the powers of educational authorities should be assimilated to those recently conferred upon parish and district councils by the Local Government Act, 1894, whereby land may be acquired for public purposes without additional allowance being made to the owners on account of the purchase being compulsory." The executive committee of the association will enter into communication with the Government on the subject.

THE annual meeting of the Liverpool Architectural Society was held on Monday. Mr. HENRY HARTLEY presided. According to the report of the Council there are 129 members, being one less than last year. The receipts amounted to 110*l.* 15*s.*, which sum was sufficient to defray expenses and to leave a balance of about 7*l.* There was an expression of regret in the report about the absence of students from the new School of Architecture, which was founded mainly through the influence of the Society. The following officers were elected:—Mr. A. CULSHAW, president; Messrs. H. W. KEEF and J. WOOLFALL, vice-presidents; Mr. J. W. BLAKEY, librarian; Mr. JAMES DOD, treasurer; and Mr. HENRY L. BECKWITH, secretary. In his retiring address Mr. HARTLEY said the most important event which had taken place during his period of office had been the establishing of a School of Architecture and Applied Arts, and the appointment of Professor SIMPSON to the chair of architecture of the University College. He congratulated the Society upon the fact that Liverpool was the first centre which had taken upon itself to establish such an educational work. He also congratulated the profession generally upon the accomplishment of a scheme which had been so long desired and so long looked forward to, namely, the formation of such a school as a great centre from which would spring new life and vigour in the development of art.

THE forms of contract for new buildings, enlargements and alterations, ordered by the London School Board, are to be altered in order to give more definiteness to the clauses relating to the payment of the London scale of wages to the workmen. A schedule fixing the rate per hour is to be appended to the contracts. For every breach of the condition about paying the prescribed rate, the contractor on demand is to pay as liquidated damages and not as a penalty the sum of 5*l.* The following conditions will also have to be observed:—"The contractor shall, during the continuance of this contract, display and keep displayed upon the site of the works, and in every factory, workshop, or place occupied or used by the contractor in or about the execution of this contract, in a position in which the same may be easily read by all workmen employed by the contractor in or about the execution of this contract, a clearly printed or written copy of the said schedule hereto, and for each and every breach by the contractor of this condition, and notwithstanding the condonation of any prior or other breach, the contractor shall on demand pay to the Board as liquidated damages and not as a penalty the sum of 1*l.* for every day during which such breach shall be or continue." The contractor shall, to the satisfaction of the Board, provide and keep proper books, in which shall be correctly and promptly entered from time to time the names of all such workmen as aforesaid and the wages paid to such workmen respectively, and shall from time to time when required produce such books to any person or persons appointed by the Board or by any committee of the Board, to whom the matter or business out of which this contract arises may have been or may be referred to inspect the same, and allow such person or persons to take copies of or extracts from such books or any of them, and for each and every breach by the contractor of this condition, and notwithstanding the condonation of any other or prior breach, the contractor shall on demand pay to the Board as liquidated damages and not as a penalty the sum of 3*l.*"

ARCHITECTURE AT THE ROYAL ACADEMY—II.

WHEN arranging the drawings in the Architectural Room care was taken to place the two studies for the church of St. Andrew, Boscombe, opposite the doorway. From their size, colour and novelty they are better adapted than any of the other drawings to excite the curiosity of people who pass through the adjoining room. They suggest a building that is mysterious, and a visitor may be tempted to enter the Architectural Room in order to discover their meaning. It would be an advantage if such colour effects could be produced in available building materials, but so long as finance rules architecture, we fear the real St. Andrew's will be less like the visionary structure presented on paper than most buildings. Surveyors would be puzzled to describe the materials that are depicted, but we are sure Mr. A. GOODWIN would consider the design to be admirable. We may now follow the order of the catalogue.

The New Chapel, Cheltenham College, is a Perpendicular structure, but with a less amount of window space than would be desirable in the majority of churches. Youthful eyes can, however, follow their prayer-books with a dim religious light. An interior view, looking towards the west end, of St. Swithin's Church, Lewisham, is contributed by Mr. E. NEWTON. Flat arches are used under the gallery, and there is a general absence of severe treatment which is gratifying. The reredos for Manchester Cathedral, by Mr. B. CHAMPNEYS, is one of the richest of its class. Colour has been used for statuary as well as paintings, and it will be worth turning into the cathedral to see so much splendour. No less desirable would be the addition of the west front to the cathedral, as proposed by Mr. CHAMPNEYS. In the design for a rood for All Hallows, Southwark, Mr. H. WILSON exalts the figure of CHRIST about the attendant saints. There are designs for some organ-cases hung in the part of the room we are describing. Sir A. W. BLOMFIELD and Mr. BODLEY have introduced more variety than is usual in the size of the pipes of the cases for St. Saviour's, Southwark, and St. Paul's, Burton, respectively. In both there is a delicacy of ornamentation which is also not common. The two views of St. Saviour's Priory Chapel, Haggerstone, by Mr. C. H. M. MILEHAM, will appear novel in a district which has much variety already in its church buildings. The view of the exterior recalls a street in some quiet Italian town. The interior is more definitely Romanesque, and in its green marble is largely used. There are also marble panels, and colour is seen throughout. In his chapel and screen at St. Alban's, Holborn, Mr. MILEHAM has produced a reposeful work. The New Chapel, Radley College, by Mr. T. G. JACKSON, shows the chancel with the organ and seats, which are elaborately carved. It is well fitted for collegiate use. Another of the architect's drawings is the screen in St. David's Cathedral. The design for the Wesleyan Chapel, Blaina, Mon., by Mr. W. L. GRIFFITHS, is interesting as evidence of a desire to avoid the characterless forms which for so long have prevailed in that region. The building is not large, but it is pleasing, and all the parts, especially the little tower, show a finesse in the treatment which is not met with every day.

The designs by Mr. A. H. SKIPWORTH should not be overlooked in the most cursory view of the collection. The first met with is a design for an organ in St. Alban's, Teddington, and excellent effect is obtained by introducing a band of angels around the gallery. Two drawings represent "a nineteenth-century attempt at a large cathedral;" there are also the church of St. Etheldreda, Fulham, and a design for a church for Abbeyvale. All these have a similar character. Mr. SKIPWORTH believes that the Gothic of the future must be severe, if not stern, in style. The old endeavour to suggest that some fairy's hand had changed willow wreaths to stone does not approve itself to him. Treatment like Mr. SKIPWORTH's and Mr. WILSON's seems, however, to be better adapted for buildings on a grand scale, and they are not in demand in our time. Mr. WALTERS has a quiet church at Petworth. A florid throne for Colombo Cathedral is shown by Mr. TAPPER, an odd sort of means to convert the Cingalese. The Congregational Church, Belfast, by Mr. H. F. T. COOPER is small but effective, without any sacrifice of economy.

The design sent in by Messrs. PALEY, AUSTIN & PALEY for the proposed Christ's Hospital Schools, Horsham, is shown on three drawings, but many will consider the chapel as the most successful portion. The interior is finely proportioned, and the chancel would be impressive. The same architects have a view of the rebuilding of All Saints, Hertford, which is a large building with tower handled in masterly style. All Saints, Swanscombe, by Mr. NORMAN SHAW, is admirable throughout. It suggests a building that would last for centuries by its sturdy character and massive buttresses. The low tower imparts distinction to the church. Credit is deserved by Mr. A. YOUNG for producing so picturesque a group as his Church of Our Lady and St. Thomas of Canterbury at Harrow, which is cheap without being vulgar. A building of this kind is preferable to the pretentious attempts which are alike unsatisfactory whether incomplete or completed. The chapel of the Hospital of St. Peter Port, by Messrs. CARVILL & PASSMORE, we trust will look less melancholy when erected than it does on paper. It is strange how strong is the prejudice in favour of the curative effects of dreariness in hospital buildings. The chancel end of All Souls' Church, Peterborough, by Mr. STOKES, is presented; so it may be assumed the greater part of the building is very plain. Mr. W. F. BRIGHT has a very dark church. The reredos in the Catholic Apostolic Church, Gordon Square, by Mr. BELCHER, is Gothic, but a much later character is imparted to the altar-rails, which are of a Georgian type with fine flowing lines. The chancel and alterations to the nave of Christ Church, Southwark, by Mr. BAKER KING, are in late Italian, and give a Romanised appearance to the building. Mr. HORSLEY's chancel at Ipstones, Staffordshire, forms, as it were, three sides of a polygon on plan. In the exterior view sculpture is introduced above the window. There is a graceful spire for Emmanuel Church, Plymouth, by Messrs. ROGERS, BONE & COLES. Another by Mr. C. A. NICHOLSON is intended for a church at Cockington. St. Michael and All Saints, Colehill, by Mr. CAROE, is shown in an interior, and is a good example of the modern village church, in which unnecessary height is avoided. The church of Our Most Holy Redeemer, Chelsea, expresses loyalty to Rome by the modernity of the Renaissance employed, and as it is reactionary it becomes more remarkable in being the work of an architect who was hitherto so loyal to Gothic—Mr. E. GOLDIE. But the grandiose character can only be realised by a large outlay, and it has yet to be shown that churches of that kind when they have to remain incomplete are as satisfactory as those in earlier styles. Mr. GOLDIE, in his church for Slough, has returned to Gothic. Mr. E. P. WARREN's church for a West London suburb is a thoughtful study. The buttresses are within the building, and are utilised, as open arches are formed through them. Mr. WEATHERLEY utilises sculpture as well as painting in his Stanford-on-Soar Church. The Lady Leng Memorial Chapel, by Mr. CAPPON, occupies apparently a limited site, and the building, which is Gothic in style, is treated simply and in good taste. In Mr. INIGO THOMAS's Church House and Garden the last is made to appear the more important, and it ought to receive the consideration due to an attempted revival of an art which should be still controlled by architects. There is an abundance of designs for stained glass to be employed in churches, but they all come from manufacturers.

There is only one school this year. The examples which are set up in London have their influence elsewhere, and that is not advantageous for architecture. The Grange Road Schools, Middlesbrough, by Mr. BOTTOMLEY, suggest that in one provincial town at least it is not supposed to be advantageous to suggest a relation between schools and workhouses and other asylums for the poor. Terra-cotta is introduced for the sake of effect, and altogether the buildings are made to be attractive to children. That only one school should be worthy of admission is a revelation of what the combined operations of the Education Department and the School Boards are turning building into. There are educational buildings of other kinds. Mr. M. B. ADAMS's Passmore Edwards Free Library, Hammer-smith, is well adapted for the purpose. It is secular in character, has ample light, is roomy and does not compel visitors to climb an inconvenient staircase to gain effect. Yet although its appearance is pleasing and adapted to its

purposes, it does not look like a costly building. The Lecture Hall, Imperial Institute, seems from the exterior to be a small building, but it is more massive and severe in style than the principal block. Two designs for the Hampstead Library are in the room. Mr. H. FIELD'S shows the rooms on the ground floor, while in Mr. A. S. TAYLOR'S there are several storeys. The design for Sutton Technical Schools and Baths, by Mr. SEARLES WOOD, presents a group of very simple buildings. The Bishopsgate Institute, by Mr. C. H. TOWNSEND, is a suggestive example of what can be done with a restricted frontage. The ornament on the spandrels of the archway is most effective from its vigour and the strength which comes from such a length of stem in an unbroken line. The New Tabernacle, Woolwich, by Mr. W. H. WOODROFFE, seems to be a mean between a London board school and a Salvation Army barrack. As there is no plan the purpose of the building cannot be guessed. The design by MESSRS. ASTON WEBB & INGRESS BELL for the new Christ's Hospital is represented by one of Mr. PRENTICE'S drawings, and it is to be hoped so important a project will not be much longer left in abeyance. The site may not be adaptable without the expense of more money than was anticipated, but there is no doubt it can be made innocuous beyond all cavil. In that way there was defective foresight, but on the other hand the dairy farm was suitable for the display of a series of groups of buildings. In the drawing there is nothing fanciful about site or surroundings.

Municipal buildings are scarce. There is a design for a modest group of public offices at Sutton, by Mr. SEARLES WOOD. The accepted design for the Rotherhithe Town Hall, by Messrs. MURRAY and FOSTER, has the advantage of large windows, and the tower is well combined with the main building. Mr. F. H. TULLOCH takes advantage of the local characteristic of chequering in his design for the Municipal Buildings, King's Lynn. The suggested Town Hall for Baldock, Herts, by Mr. W. C. JONES, does not err from too much simplicity, and it is necessary to propose to turn the lower part into shops. A design in Italian style, by Mr. T. B. SILCOCK, for the Llandudno Municipal Buildings, was selected. In the Quingentenary Memorial Building for Winchester College, Mr. CHAMPNEYS has employed rustication to a larger extent than is seen in the other drawings. The School of Art Needlework, by Mr. FAIRFAX WADE, is refined in treatment, and is adapted for its position at South Kensington. Mr. BRYDON'S Pump-room Buildings, Bath, will be in keeping with many of the buildings in that city in which vigour is subdued. The Staffordshire Infirmary, as remodelled by Mr. ASTON WEBB, with its long narrow windows and symmetrical arrangement, is not so showy as some other late examples. The absence of steps to the principal entrance will be a boon to sufferers. The design for the Municipal Buildings, Darlington, by Messrs. CLARK & MOSCROP, is one of the most successful of the works of its class which have been seen at Burlington House. The Perth Public Library, by Mr. A. G. HEITON, is suited to the circumstances of a town that is not wealthy and in which money would be spent more willingly on literature than on ornament.

The offices of the Prudential Assurance Company are to be found in most of the principal towns, and they have the advantage in a business sense of being readily recognised by their style. The new Edinburgh office is equal to the best of its predecessors. It is not possible to have a definite type for all insurance offices, but Mr. WATERHOUSE in his buildings of the kind and in his banks makes it plain they are not residences. As usual red brick and terra-cotta are used, and the number of mouldings in pieces of the latter give emphasis as well as variety to the façades. In the first premiated design for the new bank, Halifax, Messrs. HORSFALL & WILLIAMS employ long pilasters in a way that was supposed to be obsolete. There may be local reasons for the arrangement.

There are several drawings of old work by Messrs. HORSLEY, NEEDHAM WILSON, MALLOWS, CORLETTE, MITCHELL, R. BARRATT, PHENÉ SPIERS, HART, ROBINSON and F. W. BEDFORD.

A couple of models in cardboard are to be seen in the Architectural Room, and that mode of representation is worth more encouragement. The visitors to the room are

so few it cannot be said that stands and models would cause an inconvenience, for there is nothing to be obstructed. The occasional visitors to the refuge prefer to glance at the drawings while lounging on the sofa.

PAINTING AT THE ROYAL ACADEMY.

AN architect who might be speculating about the decoration of a building will not find many works to aid him in this year's exhibition. Nor will lovers of historical subjects be able to discover much to gratify them. It is not a year for grandiose subjects, and there is no work which will be generally accepted as "the picture of the year." The exhibition, however, deserves to be popular. In every room there are pictures which should afford pleasure to all except those amateurs whose imaginations are so creative they can stand before the noblest work and ask "Is this all?" In fact we cannot recall an Academy exhibition in which the average standard was higher. The hanging also is equitable. There are freaks of juxtaposition which are evidence of the existence of a humourist among the committeemen, but there are fewer excellent works near the ceiling than are usually seen. As a consequence the visitor will find that only a small percentage of the works can be skipped. A criticism on the exhibition should therefore be comprehensive. But as usually happens critical and uncritical visitors are compelled to submit to limitations, and for our part we must restrict ourselves to works which cannot be passed over without injustice.

In the first room, *The Little Mother*, by Mr. S. H. HENSHALL—a child in a blue cotton dress with white spots, holding an oppressive baby of the Tetterby species wrapped in a blanket—would be taken in the Salon for a French work, owing to the skill with which effect is gained by blue, yellow, and white. Mr. GOTCH likes to employ flowers as adjuncts to his figures, and his *Death the Bride*—a woman in a black transparent veil—stands amidst poppies that are capably rendered. The *Icarus* of Mr. PEPYS COCKERELL is the best work he has produced. The primitive inventor lies crushed on the sand near the sea, and the great wings which were so gaily bound with yellow ribbon are broken. The pathos of the scene is deepened by the restraint which the artist imposed on himself. Another case of a tragedy depicted by means of a single figure is *St. Stephen*, by Sir J. E. MILLAIS. He has departed from precedents. The proto-martyr wears no rich chasuble; he is simply clad, and lies on the ground amidst trees which allow a glimpse to be seen of the sky, with its stars. All is repose, and the simplicity suggested by the character of the figure appears to have attained its fitting termination. Mr. ARTHUR LEMON'S *Centaur* is a new version of an old theme. Mr. W. B. RICHMOND'S *Countess of Pembroke* is in a manner which may be a sign of transition or may be the result of devotion to mosaic. The head and gown might be painted by two men. The satin is broadly treated; the face somehow recalls the peculiar handling which Mr. BRETT follows with pinkish rocks. In another room the *Aphrodite*, *Eros*, and *Himeros* display the same sort of flesh painting. It may lead to excellent execution, but at present it can hardly be approved. Mr. LEADER'S *Evening*—a vicarage and church—is as characteristically English a scene as any of the painter's works, and he was never more successful in suggesting the light and quietude of the close of day. Mr. DICKSEE'S *Reverie* is another example of the difficulty he finds in expressing things simply. The relationship between the mortals and the ghost is not apparent, and if the nocturnal visitor were painted out the picture would not suffer. The artist was not content, we suppose, with a display of artificial light which REMBRANDT would never attempt; he must also have a hazy being subjected to its influence. It is a pity Mr. DICKSEE does not believe with the Greeks that a half is sometimes more than a whole. Several years ago we expressed surprise that Mr. CLAUSEN was not sought out as a portraitist. His *Mrs. Herbert Roberts* is a success because it is characteristic of his style. It is only necessary to look at the eyes to be assured of that fact. It is not every fair lady who would care to be painted with so little display, and such indifference to the means for securing admiration for figure and millinery. A style

of the kind is not for showy women, and Mr. CLAUSEN will never be a fashionable portraitist; but for those who prefer mind to raiment it should have value.

The second room contains a *Palazzo Ca d'Oro*, by Miss STANLEY, which will bear comparison with any of Miss MONTALBA's versions. Mr. SEYMOUR LUCAS's *Waiting for the Duc de Guise* is such an interpretation as would occur to most painters, but the execution is masterly. Mr. LESLIE's *November Sunshine*, a bit of the Thames crossed by a bridge, must extort admiration from landscapists. Mr. GEORGE CLAUSEN employs more colour than usual in his *Harvest*, for the harvesters are illumined by the setting sun, but he compensates for the novelty by *The Farmer's Boy*, which is almost a monochrome. Mr. WATERHOUSE's *St. Cecilia* will look far better when time has operated on it. Some of the colouring is very crude; with such lips as are painted it was necessary to exceed throughout.

Sir J. E. MILLAIS has a worthy companion to the *St. Stephen* in his *A Disciple* in the third room. Mr. F. DICKSEE, in his *Paolo and Francesca*, adheres to precedent in making a woe-begone pair of lovers. The pictures by Sir F. LEIGHTON in the room show no indication of failing powers. *Lachrymæ* is subdued in colour, but *Flaming Fune* subdues all the pictures around it. The latter is, as it were, a modern version of a Sistine sibyl. The figure reposes in a way that would hardly be comfortable, although very agreeable for a spectator. The orange robe is in its way as daring as the scarlet coat of the "beefeater" which amazed MEISSONIER and other French artists. The details of the girl's figure are finished with exceptional care, and altogether the picture is one which should become public property. In his *Glen Orchy* Mr. HENRY MOORE has painted sea water that is not a pellucid blue, and, still more extraordinary, the sea forms only a small part of the picture, and is subservient to the wild Scottish landscape. Mr. CALDERON, in his *Ariadne*, represents MINOS' fair daughter as having ventured into the sea after the perjured THESEUS. It is a novel interpretation, but the figure has to be made small in consequence. Mr. HOOK is still in his prime as a painter. His *Seely Sheepe* and *A Harvest in the West Country* are as characteristic as any of his pictures painted twenty years ago. Sir J. E. MILLAIS is not content with early Christian confessions; in *Speak! Speak!* he is ambitious also to represent the phantasmal. An artist in his position should respect the limits of his art, and, we must say, not much is gained by what has been attempted. It is impossible to determine whether the bejewelled lady who pulls aside the curtains of the bed in which the man is seated retains any human feelings. Apparently, like BANQUO, she has no speculation in the eyes with which she gazes, for her face is as inanimate as a mask. We may allow that the painter has produced a pictorial riddle, but in these days surely art might find some worthier occupation. We prefer visions like Mr. ALMA TADEMA's *Spring*, for in it imagination has been well exercised in recreating a beautiful scene. All the girls who carry baskets of flowers, as well as those who sing or play on musical instruments, may be as remote from reality as any ghosts. The Ionic columns, the arches, steps, and benches, may also be unlike the work of Roman masons. But if the whole procession is untrue, it compels us to conclude that it ought to have been witnessed in Rome, while nobody can have any interest in ghosts or their performances. Art fails when it attempts to excite terror, and Sir J. E. MILLAIS has confirmed the old experience. We hope he will not waste his genius upon exercises that are doomed to be futile.

It is to be hoped the production of puzzles will not be contagious, for it is astonishing how few of them will suffice. The visitor who goes systematically through the galleries will discover that if he has escaped a stony face in No. 3, another awaits him in No. 4. Mr. YEAMES is not the kind of man who would be suspected to produce such a picture as *Defendant and Counsel*. The stoutest litigant would quail if three junior counsel were set on him at once without the modifying influence of a Q.C., and it is no wonder if any young lady, who is as handsome as is represented, should come near the loss of reason. Her paid advisers are, however, without pity. But there may be another or a hundred interpretations of the picture. Whatever is the nature of the transaction, the figures are

put on canvas with astonishing realism, and it is to be regretted that so much power was not applied to a more satisfactory subject. Mr. HORSLEY's *Theological Students* would be excellent if the young English parson with his bride and his Baedeker could be eliminated. Tourists of that kind often are ridiculous, but here one of them appears to be inferior to his Mohammedan brethren. Mr. J. W. GODWARD's *Priestess* might be intended as a pendant for Mr. PRINSEP's *Golden Door*, which appeared a few years ago. Some of JOHN MARTIN's spirit must have entered into Mr. A. GOODWIN. His *Christians leaving the City of Destruction* is as imaginative as any of the earlier painter's palaces in Babylon or Pandemonium. In these days when architecture is succumbing to engineering, and building has become akin to the iron bridge and the iron ship, it is refreshing to see any sign of a belief that the art can be made subservient to the utmost efforts of fancy. A portrait, in the fourth room, by M. CAROLUS DURAN indicates how much has to be done before French effectiveness is reached.

(To be continued.)

THE MAISON CARRÉE, NIMES.

THE discovery by Professor W. H. Goodyear that some of the lines of the Maison Carrée which were supposed to be straight are curved, was mentioned some time ago in this Journal. In the *Architectural Record* for the present quarter the professor gives an account of what he ascertained on the subject, and it forms a most interesting essay. Professor Goodyear begins by describing the earlier discovery of a similar sort by Mr. F. C. Penrose, whose "Principles of Athenian Architecture" he terms an epoch-making work. An account is also given of Mr. John Pennethorne's revelation of the existence of curved lines in the temple of Medinet Habou. A century earlier the Parthenon was carefully measured by Stuart and Revett, but they were regardless of the phenomenon. The reason for the long delay in perceiving the reality is, says Professor Goodyear, that "the modern eye is dull and blunted as compared with the eye of the Greek. People look, but they do not see." It is therefore not surprising that the discovery of similar curves in the temple at Nîmes should have been delayed until the arrival of an American student. The professor says:—

No doubt an occasional student or observer has noticed these curves in the Maison Carrée and set them down to the score of masonry displacement, a fact so common in old buildings that the first thought of every architect and builder would naturally be that the timbers of the roof had thrust out the cornice and that the curve was not in the original construction. This is why I took pains to arm myself, when at Nîmes, with certificates from the official architect of the city and from his predecessor in office; the latter being especially familiar with the roof and upper masonry of the Maison Carrée; to the effect that these curves are in the masonry construction, although these gentlemen had not previously observed the fact.

Herewith are the certificates:—

The undersigned, Eugène Chambaud, ex-architect of the city of Nîmes, after examining the curved lines of the Maison Carrée with Mr. Goodyear, has verified the existence of these curves as being in the said construction, with the proviso that the curve on the east flank has been exaggerated by a thrust of the roof timbers, but also verifying the fact that there has also been a curve on this side in the original construction—considering that the line of bases in the engaged columns is curved on this side as it is on the other, and that there has been no thrust here; considering also that the movement (owing to thrust) is far from having been sufficiently great to produce the curve of the cornice. He considers the theories of Mr. Goodyear regarding the perspective effects of the curves as a reasonable one, and remarks that the theory regarding the perspective effect of a convex curve is new but possible. He has observed with him that the variations of inter-columnar spacing on three sides of the monument would undoubtedly have a perspective effect, according to Mr. Goodyear's ideas. The joints of the cornice on the west side, where there is a curve of 11½ centimètres, as measured by Mr. Goodyear, are intact, with one exception, which is not important for the question of the curve.

Nîmes: February 23, 1891.

E. CHAMBAUD.

February 20, 1891.

The measures herewith have been taken with the assistance of Mr. Augière, architect of the city of Nîmes. He witnesses to having observed the curves with Mr. Goodyear, and he verifies the fact that there has been no thrust in the cornice of the west flank. As professor of perspective he wishes to say that he considers the theory of Mr. Goodyear regarding the perspective effect of a convex curve in plan new but reasonable. As to the effect of a concave curve in plan it is familiar to experts in perspective.

A. AUGIÈRE.

I must add that on one side of the Maison Carrée the curve has been exaggerated by a subsequent movement of the masonry, and that on this account I confined myself in measurements for the cornice to that side where the masonry is in thoroughly good condition. For measuring the cornice curve I employed tin-roofers, who scaled the building by ropes, and dropped a plumb line to the pavement below. The curves of the cornice, wholly due to masonry construction, are in horizontal planes convex to the position of the spectator, and measure about 5 inches.

I also made measurements on the line of the stylobate which show slight corresponding curves in the line of the temple wall and of its engaged columns along the plinth line. I have no hesitation in saying that even on the line of bases of the engaged columns resting on the stylobate there are slight convex curves in both temple walls on the long sides. It is also certain that the great increase of the curve above was obtained by leaning out the walls and engaged columns at the centre.

It now remains to say what is the importance of this observation on the Maison Carrée. First, it overthrows the presumption of scholars that the Greek curves were unknown to the time of the Roman Empire, whose taste has been so far considered too coarse for this refinement. This observation, therefore, carries the history of the Greek curves from the time of the fifth century before Christ, down to the time of the second century after Christ. It extends the life of this Greek refinement seven centuries later than as previously known. Second, it reopens the question as to the purpose of the Greek curves. The explanations which have been previously offered must be revised or supplemented to some extent, because the explanations previously offered have referred to curves in elevation and not to curves in plan.

This brings us back to the explanations so far offered for the Greek curves. We have seen that the German architect Hoffer was the first to announce the Parthenon curves in publication. This was in 1838. Hoffer's explanation was that the curves of the upper lines were intended to accent and exaggerate the effects of curvilinear perspective and thus give increased dimensions to the building when seen from a point of view facing the centre of either side, but he also considered them as giving life and beauty to the building, and as superior to the more monotonous and colder effects of mathematically straight lines. This latter view is the one which has mainly figured in the standard compendiums of the Germans; for instance, in those of Kugler, of Schnaase and of Jacob Burckhardt. It has not been abandoned by the publication of Thiersch, whose essay is the only contribution to the optical and mathematical questions involved, aside from those of Penrose and Pennethorne. Thiersch, however, in the main, accents and develops the point of view of Penrose. The views of the latter as to the theory of the curves have naturally been most familiar to English and American students, and as his measurements are our only authority for the facts, his theories have naturally been generally accepted by his English and American readers. The explanation of Penrose moves from the accepted fact that there is a tendency to optical downward deflection in the straight line of an entablature below the angle of a gable or pediment. It is his theory that these lines of the entablature were accordingly curved upward in order to counteract this defection. As to the curves of the flanks Penrose regards them as a consequence incident originally on the methods pursued for the entablatures under the pediments, and then adds:—

"We may attribute the use of this refinement to the feeling of a greater appearance of strength imparted by it, to the appreciation of beauty inherent in a curved line and to the experience of a want of harmony between the convex stylobates and architraves of the front and the straight lines used in the flanks of the earliest temples. And farther, if we may suppose the first examples of its application on the flanks to have occurred in situations like those in which the two temples above mentioned (viz. the Parthenon and Olympian Jupiter Temple) are built, the presence of a delicate, but not inappreciable curve in what may be considered as Nature's great and only horizontal line may possibly have combined with other causes to have suggested its use."

Although Penrose is distinctly of the view that the hardness and dryness of modern copies of Greek architecture are due to the absence of these refinements, his effort is in each case of the various refinements quoted at the opening of this paper, to look for an optical correction as distinct from an optical illusion; and yet for the most important curves of all, viz. those of the long sides of the temple, he does not even suggest that an optical correction was needed.

We come finally to the views of Boutmy, "*Philosophie de l'Architecture en Grèce*," 1870, who returns to and revives the idea of Hoffer of a perspective illusion, but still confining his explanation to an effect from one point of view, viz. that opposite to the centre of the sides or ends of a temple.

Now, the importance of the observation of curves in the

Maison Carrée is that they were not applied to the pediments at all, but exclusively to the sides. The theory of an optical correction is therefore insufficient, and the theory of a perspective illusion appears to be the only one left us; but this theory has never previously been announced as an explanation for the construction of curves in plan convex to the point of vision. It is, however, clear that all curves in plan convex to the line of vision produce an effect of curves in elevation. I am indebted to Professor William R. Ware, of Columbia College, for the information that at an angle of 45 deg. a curve of 5 inches in plan, when not perceived by the eye, will produce an effect of 5 inches curve in elevation. From all points of view further removed the effect will be less, but the builders of the Maison Carrée and of the second court of Medinet Habou seem to have purposed to make this good by making the curves correspondingly heavier to begin with.

In the Parthenon the curve is under 4 inches in 228 feet. At Medinet Habou the heaviest curve is 8 inches in less than 100 feet, and at Nîmes it is nearly 5 inches in about 100 feet.

To the above points we must now add the general revision in the attitude of archæology to the question of curves in ancient architecture, which is probably involved in my observations for curves in plan in the courts at Karnak, at Luxor, and at Edfou. The conservatism and habits of repetition in Egyptian art would under any circumstances make it highly improbable that the curves in Egyptian architecture were confined to the one temple of Medinet Habou; but we have seen that, owing to the late announcement by Pennethorne (1878), and the general oversight by Egyptologists of this announcement, their existence even here is still generally unknown to science. A few words then as to my own observations in Egypt. My trip here was made in the interest of other studies, and the subject of lotus ornament and its influence on Greek patterns. My measurements and observations were consequently hurried and imperfect. Still, here are the facts. Although the great court at Karnak is so filled with rubbish that one can climb in several places to the top of the architraves, I am able to announce, as far as these architraves are concerned, that curves convex to the court are visible. At Luxor the columns of the largest court on two sides have leaned forward so far as to threaten downfall, and have been shored up accordingly by beams during and since the excavations not quite completed in 1891. Measurements taken by me in all three courts at Luxor show curves in all lines of columns at the bases, all convex to the centres of the courts, varying from $1\frac{1}{2}$ to 7 inches. It is clear at Medinet Habou that the lower curves in the lines of the bases, and in the lines of columns near the bases, were comparatively slight, and that the curve was obtained in the architrave and cornice (as it was at Nîmes) by leaning forward the centre columns. This would explain the movement of the masonry which has required the columns at Luxor to be shored up by timbers. All earthquakes and other forces tending to disintegrate these buildings, such as pulling down and destroying the accessible parts of the temple, would tend to exaggerate the lean of the centre columns, and bring about the threatened downfall now imminent at Luxor. My observations at Edfou point the same way. On all four sides of the court I have measured curves in the line of the bases of $1\frac{1}{2}$ inch on each side of the court. Very heavy curves, of 10 inches in one case, appear in the cornice lines; but the cornices have moved forward, and the original lean of the centre columns has been exaggerated by accidental tipping. The joints of the columns have parted at the rear, and it will require careful examination and survey at Edfou to show how much of the upper curve is due to movement of the masonry and how much is due to construction. One main fact remains to be mentioned for Egyptian temples. Although their curves have so far been utterly ignored and neglected excepting by Pennethorne and myself, the existence of other perspective illusions is admitted for Egyptian temples by Egyptological experts.

It is noted by a number of authors that the temples were generally built with pavements rising toward the sanctuary, and with roofs gradually lowered in the same direction, and that this was done for perspective illusion. Maspero is one of the authorities who mentions this. Mention is also made of this by Rawlinson and by Professor Reginald Stuart Poole.

Although these various observations point to a perspective purpose in the Egyptian and Greek curves, I do not wish to appear to antagonise the view that optical refinements were used in Greek architecture to correct optical illusions, for I believe that they may have been so used; but I wish to point out that the theories which are confined to correction are insufficient to meet all the facts, and that the theories which have considered the creation of optical illusions to have been one purpose of the refinements are now materially strengthened.

The existence of a temple at Nîmes having curves on the flanks without having them in the entablature of the pediments tends to antagonise the view of Penrose, that the correction of a downward optical deflection below the pediment was the first cause of the introduction of the curves in Greek architecture.

The temple of Neptune at Paestum is quoted by Penrose in support of his view, as having only curves under the pediments, but strange to say this temple at Paestum has been subsequently announced by Jacob Burckhardt to have convex curves on its flanks in horizontal planes. This observation is also quoted by Thiersch. Thus I close my paper by pointing out that we have at Paestum one ancient Greek precedent for the curves in plan at Nîmes, and that both point to Egyptian influence. The city of Nîmes was settled by a colony of Alexandrian Greeks from Egypt. It appears therefore probable that the curves in Greece were derived from Egypt and had the same purpose, but that the curves in the Egyptian courts were generally changed to curves in vertical planes by Greek art. This was a more refined expedient for attaining the same end, less conspicuous in buildings using colonnades for exterior porticoes as distinct from buildings using colonnades for the interiors of courts. It is comparatively easy to sight for a bulging curve on the exterior of a building, but more difficult to sight for it in the interior of a court. I was not able, for instance, to sight for the curve at Medinet Habou without going on the roof of the portico, but at Nîmes I was able instantly to sight for the bulge on the long sides from the level of the street. These facts, therefore, coincide with the view that the general purpose of the curves in Greek art was connected with the wish to have them inconspicuous, and that the curves at Nîmes represent either a direct influence from Egypt or the coarser taste of the Roman period. On the other hand the flank curves of the Neptune temple of Paestum, which is a very early Greek building, will represent the period of direct Egyptian transmission to Greece.

As it is generally conceded that Vitruvius drew his matter from earlier Greek authors whose works have perished, and that he did not always fully comprehend the ideas of his sources, I have omitted any argument concerning his direction that the stylobate curves are to prevent an effect of "alveolation" (i.e. downward deflection) at the centre of the stylobate. The only modern author who has attempted to explain this direction by optical theories is Thiersch. This author gives his reasons for supposing that a spectator standing near an angle of the stylobate and below the level of its platform might experience an optical effect of downward deflection in the lines of the stylobate which an upward curve would correct, but inasmuch as a bulging curve in plan could not correct this effect for the standpoint near the angle, I have not considered his theory in this paper, and I only mention it as giving one more illustration of the new light thrown on the Greek refinements by the discovery of curves in horizontal planes. There are very valuable remarks in Boutmy's work as to the general unreliability of Vitruvius for a comprehension of the Greek curves, and one purpose of this paper is to accent the value of Boutmy's contribution to the philosophy of Greek architecture. His work also contains quotations from Greek authors on the optics of architecture showing that intentional optical illusions and intentional optical corrections were alike familiar to them.

There is one thing more to be said before I close. The credit for the original suggestion that there is an historic connection between the Greek curves and those of Medinet Habou belongs to Mr. Pennethorne, as does the credit for both discoveries. The wholly original part of this paper as regards historic facts is that which points to the fact that two classic buildings—one early Greek at Paestum and one late Roman at Nîmes—show convex curves in plan which are identical in character with the curves in Egypt. The wholly original part of this paper as regards observations is that which relates to Nîmes, Karnak, Luxor and Edfou. The wholly original part of this paper as regards the effect of the Greek horizontal curves is that which shows the optical results in actual historic buildings of convex curves in horizontal planes. I am willing to leave the question of purpose to the expert and to the general reader.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE members of the Northern Architectural Association paid a visit to Billingham and Norton Churches, architects being present from Hexham, Newcastle, South Shields, Darlington, Stockton, and Middlesbrough. The weather was unpropitious, but notwithstanding this a very pleasant afternoon was spent. The thanks of the members are especially due to the Rev. Phillip Rudd for kindly showing the members over the interesting church of Billingham, and the Rev. T. E. Scott for giving permission to look over Norton Church.

In the evening a conference was held in the Masonic Hall at Stockton, to which local practitioners were invited. At the meeting, which was presided over by the president of the Association, Mr. Joseph Oswald, the advantages of the Association were laid before the local architects by the president and Mr. A. B. Plummer, the secretary. Several suggestions were made, the principal one being as to the desirability of forming a local centre of the Association, and the meeting proved very interesting.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual general meeting of the Institute of Architects was held on Monday evening. Mr. F. C. Penrose, president of the Institute, was in the chair.

The Annual Report.

The business was the consideration and adoption of the annual report of the Council, which, after referring to the losses the Institute had sustained since the issue of the last report by the deaths of Mr. Wyatt Papworth, Mr. Ewan Christian, royal gold medallist and President 1884-86, and Sir Henry Layard, hon. Fellow, who had been connected with the Institute forty-four years, and who had received the royal gold medal in 1868, showed a satisfactory state of affairs. The Fellows numbered 604, and the Associates 921. During the past twelve months five Fellows (who were previously Associates) had been elected, and 91 Associates (19 of whom were previously students), while the number of hon. Associates was 61, and hon. corresponding members 55. The number of students had increased from 101 to 143, and of probationers from 577 to 736.

The art standing committee reported that, in view of the fact that one or, possibly, two important new bridges across the Thames at Vauxhall and Lambeth were in contemplation by the London County Council, they had given special attention to the matter, in order to secure structures worthy to rank with Waterloo and London Bridges. Although the committee regretted that their endeavours to secure stone structures had been unsuccessful, they desired to record their sense of the courtesy and attention with which their views had been received by the bridges committee of the London County Council.

TESSERÆ.

The Hamilton Vases.

A FEW objects, and those of little value, were contained in the British Museum till the year 1778, when Parliament granted a sum of 8,400*l.* for the purchase of Sir W. Hamilton's collection of ancient Greek vases and various other objects of art. This collection, perhaps the finest ever known at that period, was a great acquisition to the country, and ought to have opened the eyes of the Government to the utility arising from similar acquisitions. In fact the discovery of these vases and their communication to the public by engravings coinciding with the discoveries of Herculaneum and Pompeii may be considered an essential epoch in the history of the arts, and contributed greatly to their revival. The spirited designs which ornamented them were studied by artists, and contributed singularly to improve the public taste. Their elegant forms, as well as the perfect quality of the clay and varnish, were analysed and imitated by Wedgwood and other chemists and manufacturers. The public were so much pleased with these imitations that our pottery was improved, and became an object of extensive demand in foreign countries. In a fiscal point of view, there can be no doubt that the money expended for the purchase of the collection in question has been repaid a hundred fold to the nation at large, and proportionally to the revenue.

False Symmetry.

Nature's rule of no waste no want is a pattern for us in our buildings. A heavy building or roof on slender pillars of lead or brick would be unhandsome, even if they should stand untouched by side strokes and uphold their weight, as they would beget in a beholder's mind a thought of the unsteadiness of the building, and of their unfitness for their office. So, on the other hand, to build a stone pier for the uphanging of great coats or hats, or a great though handsome stone bracket, such as we have somewhere seen, for a light clock-head, would be an uncomely waste of stone and strength, as unfitting in its kind as that of two men who might take a great shoulder-pole to carry a skein of worsted. On the other hand, a font which is to gather round it minister and people, from whom it may receive a shock, and who, for the peace of their minds in prayer, should have no misgiving of trust in its stability, can hardly be too massy. Another fitness of things is that of number. That we should have two legs or two hands we can readily perceive, even without a loss of either of them, as we can perceive that a bird or insect should have two wings, and as we are taught by the stereoscope that we need two eyes. We can thus understand the good of the animal and other dualities upon which the Greeks grounded the use of their dual word-form in their speech. But some seem to have applied this two-foldness of life-forms to buildings, in which there is no such need of it. To make a blind window in a wall only to match a light-receiving one, or in the building of a stair-climbed turret to build a turret as its fellow only for the sake of a needless fellowship, or a matching of one with one, seems to be a slighting of the rule of fitness—no waste no want—and so

of a rule of the beautiful. A better rule might be, "Let your want give your plan, and then grace it as you can."

Collars and S. S. Chains.

The meaning and origin of the letters which form a part of chains worn by chief justices are lost in obscurity, and antiquaries have puzzled their brains in vain to give a satisfactory explanation. Indeed it has been doubted whether they are letters at all, or merely links of the chain accidentally formed in that shape. Mr. Foss is inclined to adopt the opinion that the S. stands for Souvèze, and has come down to us from the old days of romance when emblems were placed on collars to express some sentiment, or as the abbreviation of a motto. Mr. Foss declares that no authentic trace of the S. S. chain has been found on the monument of any chief justice until the reign of Edward VI. Some twenty years ago the Chief Justice of the Common Pleas was said to have worn the chain which belonged to Sir Edward Coke. Lord Ellenborough had the one which adorned the neck of Sir Matthew Hale, but kept it on his retirement in 1818. Lord Denman gave his to the Corporation of Derby, "whose mayors will thus in future be decorated with the livery collar of the earl who took his title from that town, and who as Henry IV. first attached it as a mark of honour to the members of the royal household." Lord Campbell bought and kept his chain, and his example was followed by his successors.

The Spiritual in Art.

The eternal power of a great work of art is the spiritual element of man which remains the same through all changes of feeling or of thought. The pride of life, ardent patriotism and heroic endurance, which formed the Greek ideal of manhood, has little in common with the doubts, difficulties and discoveries of our century, and were the vital power in their art dependent upon these qualities it would long since have ceased to interest us. But the spiritual element which elevated men and women into ideals of beauty is with us still, though with changing circumstance it has changed its aim. Where do you think the divinity of those old statues came from? Did it arise from the big muscles and smooth skins of the models who sat for them? No, the divinity was then, as it is or should be now, in the artist's mind, in the meaning which he saw through his spiritual insight. People talk vaguely about the spirit of beauty in these Greek statues, but the same loveliness (though not the same amount of technical perfection) is to be found in all great works of art as in these, and it arises from the painter or the sculptor having expressed in the work not only his sensuous and intellectual, but, chief of all, his spiritual insight. Says George Eliot, "A woman's arm touched the soul of a great sculptor two thousand years ago, so that he wrought an image of it for the Parthenon that moves us still as it clasps lovingly the time-worn marble of a headless trunk." What is it that moves us still? The beauty of the marble curves alone? Surely not, for if so our admiration must be of the same kind, though infinitely inferior to that we bestow upon the ordinary every-day reality. Or is it the fineness of the execution, its perfection of delicacy and strength? None of these would move us to aught but critical admiration, cold as it is clear. No, the essential loveliness is that which has passed into the marble from the soul of the sculptor, it is his feeling which we are brought into contact with, his love which moves our own. This is why all schools of painting have inevitably ended in lowering the standard of work, for after all a school is nothing but the attempt to produce works like those of a given master. And as the vital principle of that master's conception lay in a quality inimitable by his pupils, the attempt is a similar one to that of making a living body from the accurate imitation of a wax figure. The first condition of an artist being this finer sight, which reveals to him depths of thought and emotion, which are hidden from his brethren, how can he communicate this insight to his pupils, and how without it can they even comprehend the meaning of his work?

Animals in Lombardic Architecture.

A peculiar feature in the architecture of the Longobards is the introduction of sculptures on internal or external surfaces or inlaid works on pavements, sometimes illustrating scenes from the Old and New Testaments, but especially revelling in the grotesque fantasies quite without religious import—sirens, dragons, griffins, nondescript creatures or the signs of the zodiac, later admitted conspicuously among details in sacred buildings. One writer, Hammer ("Fundgruben des Orients"), refers these fantasies to an Oriental and Gnostic source, assuming that they were first introduced into Christian architecture, but in a sense adverse to sound doctrine, by degenerate Templars in the East, who had derived them from the fanatical sort of Ismailians or Assassins. But a cogent "object" to this theory well urged by Ricci is that the Templars, whose Order arose in 1128, had been long preceded by the Longobards in such architectural originalities, and that no intercourse with the East anterior to the Crusades can be supposed to have im-

ported anything of the kind into a school of northern Italy. By the twelfth century this strange symbolism had encroached into painting as well as sculpture, and become so prominent in churches as to excite the reprobation of St. Bernard. That eloquent saint may have been right in opposing it, and yet such a marked novelty in the development of sacred architecture has a value and import of its own; its shows us the Northern imagination, wild, sombre, grotesque, undergoing the Christian influence, yet still retaining its peculiar tendencies, which now find place in the service of that religion that appropriates while it illumines what it touches, is alike at home amidst the brilliancy and splendour of the modern Italian basilica and the dim-lit aisles of the Gothic minster, and in its large comprehensiveness embraces all forms of genius, all energies and biases of nationality. We may remember how from early ages Christian legend had peopled earth and air, the desert and the ocean, with mysterious beings, ever foes to man—

Viewless and deathless and wondrous powers,
Whose voices he heard in his lonely hours.

From familiarity with the idea of which demon intelligences, hideous when manifest, infernally evil in operations, it is not unnatural that uncultured minds should return scared and horror-stricken into the walks of reality, thus disposed to translate their visions or fears into such art as practitioners schooled by classic teaching had hitherto never thought of, as the clergy under the immediate guidance of Rome would not probably have sanctioned. The happy idea of enlisting animals into the Christian service for the expression of sentiment and truth had indeed its origin in the art of the catacombs, and as it developed itself the place of such creatures in the sanctuary became more distinctly marked, their meaning more definite.

Venetian Colouring.

The system of the Venetian school corresponded with the way in which Nature herself atones for the want of light and shade in hot countries. In short, the character of nature in Venice and in the works of Titian and others, is to produce light and dark by colour, the noblest and most general system of imitation. In Greece the sea and sky are sometimes the darkest parts of the general picture. The monotony of a sandy ground is relieved on one side by the sparkle of marble, and on the other by the depth of the cypress and evergreen oak. So much for inanimate nature; but we find the deep rich tones of men and animals, and even the dresses of the first, all combine to make amends for the want of that shadow which the northern climates have without colour. The Venetians, therefore, formed their style from the study of Italian nature. There is very little light and shade (except in the landscape) and a great deal of deep colour. In a hand, for instance, by the time the half-lights and shadows are done (both differing from the colour of the light) the mass of flesh colour is lost. In the Venetian pictures and in nature looked at largely the local colour ends only with the outline, and to give the utmost quantity the Venetians make the outline also warm. This forms a considerable part (applied to everything) of the breadth of colour so admired in Titian. The simple question, What is the general character of the object to be represented? explains the style of Titian, for he always penetrated it. Many appearances in nature have more than one general characteristic by which they are universally recognised. Thus, while Titian aimed at the quality of depth in the sky, Claude seems to have loved another of its attributes, and, reflecting that the sky was the source of light, he seems to have determined that brightness was its universal character. Claude seems to have copied the forms of trees in a relative point of view, their forms assist his composition, and their tone gives brightness to his sky; but Titian always expressed the universal character of a tree, viz. growth. It is always bursting with the efforts of vegetation. The forms are hence often peculiar, and at first one would say that Claude is more general in his choice of trees; but what appears accident in Titian's case is really the character.

Mediæval Painting.

The art of architectural painting reached its culminating point in the twelfth century. The stained glass, the miniatures and ornaments of manuscripts, and the fragments of mural decorations of the epoch announce an advanced state of art, a singularly comprehensive knowledge of the value of colour and its harmonious arrangement, and a coincidence between that harmony and architecture. It is certain that the art of architectural decoration developed itself in the cloister and proceeded from Byzantine art. The most beautiful stuffs, furniture, decorated utensils, and a great number of illuminated manuscripts were then brought from the East and were preserved in the treasuries and libraries of monastic establishments, and were used by the monks as models in their own art labours.

NOTES AND COMMENTS.

MR. MARTIN UNDERWOOD, who was lately found drowned in the river at Bolton, Lancashire, was at one time a member of the firm of architects, LLOYD, WILLIAMS & UNDERWOOD, of Denbigh, North Wales. He gained honours as a student at University College, London. He was first in construction and in fine art, &c., won the prize at the Royal Institute of British Architects, was made Fellow of the Society of Arts in 1879, was author of a standard work on the "Castles and Churches of North Wales," and for many years contributed largely to the professional press. He was an exceptionally talented architect, and his artistic work was of a very high order. He was fifty-five years of age, and to the last industrious and deeply interested in everything relating to art. Work was to him a pleasure, and he entered into anything that required creative power and a development of the beautiful with the enthusiasm of a young man. He was endowed with the gift of originality that few possess in an equal degree. Rapid in work and untiring in effort, he accomplished throughout his professional life more than most men are capable of doing. In his later years he had been unfortunate, and the end of his life came before the reward which he so well deserved.

OFFICIAL information has been issued by the Italian Government relating to the exports of paintings and other works of art from Italy during the past year. The number of new paintings was 4,437, the value being 845,531 lire or 33,800*l*. The examples of sculpture numbered 971, the value being 484,336 lire. In addition there were 9,090 works of various classes valued at 644,344 lire. The paintings by old masters numbered 916, the value being 213,150 lire; the sculpture 165, of the value of 225,865 lire, and smaller works such as gems, medallions, &c., numbered 36,988, the value being 559,390 lire. In the month of June occurred the largest increase in the last item, for by the sale of the Boyne Collection 22,769 coins and medals, including 1,572 Greek and Roman, 13,641 Mediæval and modern, and 7,556 Renaissance examples, were sent out of Italy.

It is a great pity that on occasions the Archbishop of CANTERBURY will discourse on art. His grace, it must be frankly said, is, in general, too indifferent to the subject to be able to speak with the authority which should belong to the spiritual head of the English Church. What his grace said about Sir FREDERIC LEIGHTON'S painting in Lyndhurst Church was a revelation of his relation to art. His grace said the artist lent one of his most beautiful pictures to the church. Afterwards there was a correction in the *Times*, and it was said to be a present. But if his grace really cared for art, he would have visited Lyndhurst during his visits to Hampshire, when it would be discovered that Sir FREDERIC LEIGHTON did more than lend or present one of his easel pictures, for the *Ten Virgins* under the east window in Mr. WHITE'S church is a fresco, and was, therefore, painted on the spot. It is hard when a painter makes a great sacrifice to decorate a church at his own expense that he cannot gain proper acknowledgment from the dignitary who should be the foremost to render him justice. The Archbishop's carelessness is not to be compensated for by mock mysticism concerning the office of painting to give "to the British nation a real insight into the life, the spirit and the universal inwardness of things." We should like to discover the universal inwardness of the blunder which his grace perpetrated when talking about the Lyndhurst picture.

THE exhibitions in the Grafton Gallery are delightful to the public. As they have generally a special purpose they are far more interesting to painters and students than the miscellaneous collections which are seen elsewhere. The latest exhibit is devoted to "Fair Children," and it reveals how many painters from TITIAN to those of our time have treated the most difficult class of subjects. Portraits like the two children of Lord CREWE are as much a testimony to REYNOLDS'S diplomatic skill as to power as a painting. It is evident the little lady enjoyed her appearance as an

old woman going to market as much as her brother when he posed as Bluff King HAL. That great painters could not always prevail with young sitters is evident from HOLBEIN'S *Edward VI.*, who must have been always in an ill temper in spite of what historians say. VELASQUEZ was more fortunate, although Spanish princelings were confident in their superiority, and somehow his *Infanta of Spain* appears at first sight to be a work of HOGARTH'S. ELIZABETH of Bohemia appears as a sort of royal Mrs. GUMMIDGE, and poses as "a lone, lorn woman," but her children are shown to be more natural and sincere by VAN HOUTHORST. On the countenance of the melancholy Prince of ORANGE, afterwards WILLIAM III., REMBRANDT was able to compel a smile to appear. HUDSON'S series of children are charming, and it is no wonder his pupil REYNOLDS followed his example in dealing with young folk. ROMNEY also was excellent. With LAWRENCE the tradition was lost. In modern times children have to be shown more conscious of their charms. But there are many portraits here where they do not appear to be posing. Sir J. E. MILLAIS is supreme in this class of work among his contemporaries. There are half a dozen of his masterpieces in the collection. But happily there are many other painters whose works are worthy to be hung near his portraits. Mr. WATTS, Mr. GREGORY, Mr. RICHMOND, Mr. PHIL MORRIS, Mr. SANT, Mr. BREUN, Mr. CALDERON, Mr. LESLIE, Mrs. ALMA TADEMA, the Marchioness of GRANBY, Miss KATE GREENAWAY, are represented by charming examples.

His residence in London has not made M. HENRI ROCHEFORT more enamoured of modern French art than he was in the days when he used to write about it under the pseudonym "Grimsel." Judging by what he has seen in the two exhibitions just opened in Paris, he says he is struck by the flatness of the figures, which seem to be glued to the canvas. The painters might never have seen a work by REMBRANDT, VELASQUEZ or VAN DYCK. The modern tendency to have only faded and grey colours is, says M. ROCHEFORT, almost heart-breaking. He believes that painters who should be masters are affected by the impressionists, and cannot do justice to themselves through fear of being considered "pompiers," which to a Frenchman is as hateful as old-fogeyism is with us. In the Champ de Mars exhibition M. ROCHEFORT says there are four or five good pictures, especially M. ROLL'S *Joies de la Vie*. The modern French sculpture he considers surpasses what is produced elsewhere, and when the Scandinavians and Americans have supplanted the French in painting, which may take place before long, M. ROCHEFORT believes they will still retain supremacy in sculpture. M. ROCHEFORT considers that in execution English painters are inferior to the French, but we are generally endowed with an artist so gifted that the mediocrity of the others is pardoned. He refers to the *Field of Repose*, or convent burial-ground, by Sir J. E. MILLAIS, as being incomparable in its melancholy beauty. M. ROCHEFORT could not fail to give a philosophical turn to his lamentation over the decadence of French art. He concludes by expressing the belief that there is one law for tenors and painters, and as after a limited time it is impossible for the former to reach the high *ut*, in the same way the painters give way to mechanical processes and decoloration.

FROM the statement of Alderman KENRICK it appears that the Municipal Art Schools and Art Gallery in Birmingham are in a flourishing condition. A loan exhibition of marine paintings by British artists attracted 141,219 people. The permanent collection was not, however, neglected, and no less than 24,142 catalogues were sold to visitors. If judged by the test of the national competition the art school surpassed all others in efficiency. Last year one gold, twelve silver, eighteen bronze medals and forty-five book prizes were gained. Birmingham thus obtained seventy-six awards, while Nottingham gained only thirty-three, Glasgow thirty-two, Manchester thirty-one, Sheffield twenty-four and Leicester nineteen. The expenditure on the school during the year was 6,581*l*.

THE GOBELINS.

IN France, and in some other continental countries, the State maintains one or two factories for the manufacture of articles in which great scientific skill in conjoined with artistic ability of the highest order. Of this kind are the celebrated porcelain manufactory of Sèvres and the equally celebrated tapestry factory of the "Gobelins." In these countries the idea of the State meddling in trade is considered repugnant to all laws of political economy, an opinion which admits of some exceptions. If a Government undertook to make shoes or any other article of common use, which could be equally well made by any trader, we should naturally condemn such a proceeding. But if, on the other hand, we could find some manufactures in which the articles were of so expensive and peculiar a nature that it would be hopeless to expect that they would become articles of general consumption, and therefore not likely to be produced by private enterprise, and which, on the other hand, would require for their production a considerable development of mechanical, chemical and artistic skill, which would be available for the use of the nation in many other branches of manufacture, the case would be different. Such are the manufactures of the Gobelins, for no person who examines the beautiful products of that establishment will come to any other conclusion than that, except as curiosities, they are of little use. How, then, it may be asked, can the manufacture of curiosities become a proper application of the funds of a nation? Simply thus: to produce a piece of tapestry requires, in the first place, the highest possible skill in the preparation of the wool, in its purification, bleaching, and above all, its dyeing; and, in the next place, an equally high degree of artistic education in adapting the materials to the reproduction of the pictures intended to be copied. The Gobelins must, therefore, be a school of design and of chemistry applied to dyeing, and that France has benefited by this school is evident by the immense superiority which she has attained in these branches of industry over every other nation. It is from this point of view that we specially value the Gobelins, and judged on this ground we believe the enormous sums spent in France in its support for more than two centuries are now being repaid with interest to the nation.

The building called the Gobelins is situate in a *quartier* of Paris celebrated in the annals of the first revolution as the Faubourg St. Marceau. Through this district flows, or rather used to flow, for it is now enclosed in a canal of stone, and shut up by sluices, the small river Bievre, which in former times enjoyed a reputation for dyeing scarlet, which it certainly does not now deserve, being generally considered a nuisance at present from the exhalations of its stagnant water. This traditional reputation, however, brought to its banks a family of dyers from Rheims, the chief of whom was Jean Gobelin. This was about the end of the fifteenth century, for Jean and his son Philibert lived there in the time of Rabelais, who says, "and it is this brook which from here passes to St. Victor on which Guobelin dyes the scarlet." Gradually their descendants became wealthy, and at length renounced trade, purchased patents of nobility, and intermarried with the families of the magistracy. One of these, Antoine Gobelin, Marquis de Brinvilliers, married in 1651 Marie Marguerite d'Aubrai, daughter of the Civil Lieutenant of Paris, who became so notorious afterwards in the annals of crime by the poisoning of her whole family.

When the Gobelins retired from business they sold their establishment to the Sieurs Canaye, who, in addition to the trade of dyeing, set up a manufactory of tapestry of haute lisse or high warp. At that time Flanders was celebrated for its tapestry, which was exported to different countries, one of the chief seats of which at one time was Andernaerde. To the family of Canaye succeeded a dyer of the name of Glück, whose family continued in possession until the time of Colbert, minister of Louis XIV., who purchased the house properly called the Gobelins, whilst the family of Glück, in conjunction with another named Julienne, carried on the trade of dyer in the adjoining buildings down to the commencement of the present century.

It will be seen that the manufacture of tapestry was at first altogether carried on by private enterprise, and continued to be so until the reign of Francis I. That monarch, to whom France owes so much in an artistic point of view, brought together the best workmen in tapestry to be found at that time in France, in

Italy or Flanders, the countries where the trade was best understood, and established them at Fontainebleau, under the direction of one Salomon de Herbaines. Here he provided them with abundance of the richest materials, such as gold, silver and silk threads, and a number of admirable pieces were executed after designs by an Italian artist named Francesco Primaticcio, pupil of Giulio Romano. Francis I. also purchased the best pieces of tapestry made by private manufacturers, so that this kind of manufacture was in a most flourishing condition during his reign. His successor, Henry II., continued to maintain the establishment at Fontainebleau, which was placed under the direction of the distinguished artist, Philibert de Lorme. Then came the wars of the League, during which, as in all civil and religious struggles, the trade of the country languished, and that of tapestry altogether ceased, for neither the Court nor the nobles could afford to devote money to any other purpose than the payment of troops. As soon, however, as Henry IV. was firmly seated upon the throne, and peace was re-established (towards the year 1600), he set about the organisation of factories for the manufacture of furniture and of all kinds of ornaments for his palaces. He established his tapestry-workers in a house in the Faubourg St. Antoine, in Paris. Here he collected a number of the best painters, engravers, carvers in gold, silver and ivory, and sculptors, to whom he added 200 tapestry-workers from Italy and Flanders. Henry was carried off prematurely in the midst of his projects for the re-establishment of the industry and art of France, and unfortunately he left in his son, Louis XIII., a successor quite incapable to realise them, who, or rather his celebrated minister Richelieu, however, established a carpet manufactory at Chaillot, near Paris, in some buildings which had been employed in the manufacture of soap, from whence the establishment since become so celebrated has derived the name of "La Savonnerie." Owing to the state of France at that period the manufacture languished, and was almost extinguished during the long wars of the Fronde and other troubles during the minority of Louis XIV. As soon, however, as the latter monarch assumed the reins of government, he endeavoured to organise the commerce and manufactures of the nation. A royal factory was established at Beauvais for the manufacture of tapestry, under the direction of Hinart; the Savonnerie was placed under the direction of the celebrated painter Le Brun, and the children of the hospitals were there trained in the manufacture of various woollen fabrics by Philippe Lourdet, at that time distinguished as a tapestry worker and carpet weaver. Even the private factories of Felletin and of Aubusson were provided with a dyer and a painter at the expense of the Government. The efforts of the Government were soon crowned with success, and the manufactures of France became in a few years the most flourishing in Europe. In order to still further contribute to their advancement, the king determined to found a model factory in which he might concentrate the highest degree of talent in the nation, not for the purpose of exposing private enterprise to a disproportionate competition, but, by serving as an example to artisans, to elevate the whole taste of the nation. It was with this intention he established in the house of the Gobelins his celebrated "Manufacture Royale des Meubles de la Couronne," or Royal Manufactory of the Furniture of the Crown, since better known as the Manufactory of the Gobelins. It was not, however, a simple factory of tapestry that Louis XIV. established; it was a great workshop, under the direction of Le Brun the painter, having at least 250 tapestry workers continually employed in executing pieces after his design, the wool being dyed by one of the most celebrated dyers of the period. Then there were sculptors in metal, and goldsmiths, by whom were executed torch-holders, candelabra, brackets, inlaid and applied ornaments, cast or chiselled in silver, gold, bronze or gilded copper, designed in unison with the tapestry. Cabinet-makers and carvers in wood and ivory constructed the furniture, whilst Florentine artists, under the direction of Ferdinand de Melini, inlaid them with marbles, agates and lapis lazuli, representing fruits, flowers and birds, which are still so much admired by all who visit the Palace of Versailles. Even the very hinges and locks of the doors of Louis XIV.'s palaces were made after designs executed at the Gobelins, under the direction of the universal Le Brun. The effects of the factory were soon perceptible in the impulse given to the application of design in all the manufactures of France, which ultimately gave to that country the empire of the world in matters of taste as applied to the wants of life.

The direction of Le Brun, which lasted from 1667 until 1693, was the epoch of the greatest prosperity of the Gobelins. He was succeeded by Pierre Mignard, one of the most distinguished painters of France, many of whose works adorn the Louvre and the Palace of Versailles; and under whom it continued to prosper until the great disasters which befel France towards the end of the reign of Louis XIV. forced the king to reserve his resources for the defence of the country, and to dismiss the greater part of the workmen. On the re-establishment of peace some encouragement was given to the Gobelins,

but its splendour was gone, and from that time forward it became a mere manufactory of tapestry.

During the first revolution the Gobelins was naturally neglected. Louis Philippe was, however, a great patron of the Gobelins. Some very fine works were executed for him, such as the copy of Horace Vernet's *Massacre of the Mamelukes*, which was at the London Exhibition of '51. The fine hangings representing the *Marriage of Francis I.*, and other scenes from the life of that monarch, after pictures of Rubens in the Louvre, were either made or at least begun under the Restoration.

THE FIRST SCOTTISH CHURCH.

UNDER the title "Scots Lore" a new publication was brought out at the beginning of the year by Messrs. W. Hodge & Co., of Glasgow. It is intended to be "a medium of intercommunication, a field for discussions and place of record" for information about the past. The publishers say they have received assurances of support from antiquaries and other specialists. In the last number is a remarkable speculation or "leap in the dark" by Mr. P. Macgregor Chalmers concerning St. Ninian's "Candida Casa," which was the earliest stone church. The exact site has given rise to much controversy among archaeologists. In the course of his article Mr. Chalmers says:—

On a visit to the cathedral church at Whithorn my attention was arrested by a peculiar feature in the ruins at the west end of the nave. Little more can be seen than a long confused mound of earth and stone, from 4 to 5 feet high. It begins a few feet from the gable of the cathedral and extends for a considerable distance towards the boundary wall of the churchyard. The foundations of walls lie buried in this mound. Thirteen feet from the cathedral the lower courses of a rubble wall are visible, lying parallel to the gable. The opening in the centre, on the medial line of the cathedral, is 6 feet wide, the jambs are plain and square, and the wall is 3 feet thick. The two walls which project at right angles towards the west are 10 feet apart. This is the foundation on which I have now to build. And my hope is that I may find here the site of St. Ninian's Church—the first Christian church in Scotland erected in stone.

King David I. re-established the diocese of Candida Casa, or Whithorn, in the period from 1124 to 1130. Fergus, lord of Galloway, during David's reign founded a priory at Whithorn for canons of the Premonstratensian order. The church, which was dedicated to St. Martin of Tours, to whom had been dedicated the original church by Ninian, doubtless formed the cathedral church of the diocese. Only the nave of the cathedral remains—a thing of patches, to which the builders of many generations lent their hands. The beautiful Romanesque doorway at the west end of the south wall is the one fragment preserved of the early twelfth-century foundation by Fergus. Its position may be held to indicate that this fabric did not extend further to the west than the line of the present gable. It is known that the three walls whose ruins have been described above are parts of the foundation of the steeple or tower which was in existence when Symson wrote his description in the year 1684. This tower was of considerable height, and formed a striking landmark on the coast. As the ruins show that there was a building of some kind to the west, and as it is clear, from an examination of its western face, that walls extended westward from the cathedral gable to join the wall forming the eastern face of the tower, it is evident that the tower occupied the centre of some building. Notes and studies on the plans of other structures, to which reference will now be made, have led me to conclude that it stood between the chancel and nave of an earlier church than that founded by Fergus. If it is possible to bring the plan to light, the spade may prove that there is an opening in the west wall of the tower, similar to that in the east wall, with a door, perhaps built up, in the south wall. . . .

St. Ninian, according to his biographer, "chose a site for himself in the place which is now called Whithorn. This place is situated on the shore of the ocean, and running far out into the sea, is enclosed by the sea itself on the east, west and south, the way being open to those who would approach it only on the north. Here, therefore, by the command of the man of God, the masons whom he had brought with him built a church, before which, they say, no other had been built in Britain in stone. And inasmuch as he learned that the most holy Martin, whom he always venerated with wondrous affection, had now passed away from the earth to the heavens, he was careful to dedicate it to his honour." The church was founded in the year 412. The walls were doubtless plastered over in the Roman manner with adamantine cement, as was done in St. Wilfrid's Church at Hexham. From this circumstance, and not from the use of white material in the building of the wall, the name Candida Casa arose. St. Ninian died on September 16, 432. He was buried, says his biographer, "in the church of the blessed Martin, which he had himself built

from its foundation, and was placed in a stone sarcophagus beside the altar. At his most sacred tomb the infirm are healed, lepers are cleansed, the wicked are terrified and the blind receive their sight."

The Church Council which was held in Britain in the year 692 was assembled by King Ina for the union of the Britons with the Saxons. It is not until the year 723, on the establishment of English bishops, that we learn of any successor to St. Ninian. Pictahelm was consecrated in that year. The succession of bishops was interrupted about 794, probably because of the anarchy in the country following the assassination of Æthelbert, and nothing further is heard of the bishops of Whithorn, until the see was re-established by King David I. in the early part of the twelfth century.

The history of the early fabrics referred to above leads me to suggest that the history of this church whose site is under consideration followed on similar lines. Erected in the first place as a nave with apse and western porch, the church was extended by the addition of a new nave to the west, the porch being reared as a tower. If this was the case, then the presumption is that the site of St. Ninian's Church has been found. The building was probably erected at the beginning of the eighth century, on the establishment of the Saxon see. And yet it is not altogether impossible to suppose, as Bede mentions the existence of a stately church in his time, that part of Ninian's work remained until the last. It was probably planned on the same model as the churches of the early part of the eighth century, for Ninian brought his masons from the renowned abbey of Marmoutier in France. The preservation of the church as a separate building, when the early twelfth-century foundation was laid, was an example followed at St. Andrews and other places.

The latter-day name of this early church is known. It was called the Outer-kirk, or Cross-kirk. As mentioned above, the seal of the chapter of St. Andrews, of date 1450, presents an interesting view of the early church of St. Regulus. Two seals of Whithorn are preserved, and on both a picture of the old church appears. One of the seals is of the year 1613; the other is probably, judging from the character of the lettering, of about the middle of the fifteenth century. The tower stands between the very short chancel and nave. Its high-pitched roof resembles that on the tower in the seal of St. Andrews. The pinnacles, and probably the upper part of the tower, are late works. The panel shown in the base of the tower, extending upwards to the wall-head, is evidently intended to represent the deep recess between the chancel and nave, due to those parts of the building being broader than the tower. We have seen that this feature existed in all the examples referred to above, with the exception of the church at Jarrow.

The fame of the miraculous powers possessed by the relics of St. Ninian spread over Europe. It was evidently to this church—this Outer-kirk—the pilgrims came. There is no more striking feature in the strangely romantic character of King James IV. than his great veneration of this saint, and many were the visits he paid to the shrine. James V. took staff in hand in the years 1532-3, and pilgrimages to the shrine had become so much a part of the life of the people that they were continued after the period of the last Reformation. They were only abandoned when prohibited and made punishable by an Act of Parliament in 1581.

This is neither the time nor the place to enter on a discussion of religious movements. It ought to be borne in mind, however, that there have been three great Reformations in Scotland. The Reformation at the end of the sixteenth century was, perhaps, more of a revolution than a reformation. It led to no new development in the planning of fabrics. An attempt was made to get back to primitive forms of church government and it may be said that the new religious order instituted was of secular clergy. The Reformation at the end of the eleventh century, with which the name of St. Margaret will for ever be associated, was necessary because the early church had become petrified as a local church, having for long ceased to regard the new developments and reforms emanating from the great centre at Rome. Monastic orders to a large extent took the place of secular clergy. The influence exerted on the fabric of the churches may still be seen in our great cathedrals and abbeys, with their transepts and aisles, and wide ranges of conventual buildings surrounding a garden. The altar now became the focus of the church. The Reformation at the end of the seventh century is associated with the name of St. Wilfrid of York. The Columban Church, which was monastic in its establishment, and whose buildings were of the most primitive type, and, as a rule, of timber, gradually lost touch with Rome. The early saints were held in great reverence, and little or no attention was paid to the advancing tide of thought and organisation. Fresh from his Roman school Wilfrid found the clergy at home preaching and practising heresy. Ardent and eloquent, the Columban Church gave way before him, and soon his influence was exerted over Northumbria and the lowlands of Scotland. As a revolt against the evils of monasticism he instituted orders of secular clergy.

Wilfrid's Reformation brought with it a model church plan. As described above, it consisted of a nave with a semicircular apse at the east end and a porch at the west. This plan probably came from Rome, through France, but I find the original not so much in the Roman Basilica as in the smaller and simpler Roman Curia.

To many it may seem remarkable, yet it is true, that the table or altar held a more or less subordinate place in the arrangement of the interior of the early church. Wilfrid was not revolting from early Roman custom when he made the focus of his church the bishop's or abbot's seat or *cathedra*. The seat was placed on an elevated platform in the centre of the apse behind the altar, and the clergy were accommodated on each side. This was a suitable and satisfactory arrangement, designed for a church which looked to the bishop or abbot as the apostle of Christ. The change which was made at a later time may be traced to the Council of Rheims, held on October 3, 1049, when it was forbidden for any bishop, except the Pope, to assume the title of "Apostolic." The church still maintained its logical position in that the Pope alone retained his place behind the altar, as he does at the present day. Two bishops' seats associated with the northern church and with the name and period of St. Wilfrid still remain. One is Wilfrid's own seat at Hexham. The other, in Beverley Minster, is the chair of St. John of Beverley, who preceded Wilfrid in the see of Hexham. What I presume was Wilfrid's chair at York is referred to in a charter of the time of Henry VII.

Development was not impossible with the plan adopted by Wilfrid. It has been noted above that as necessity arose the fabric was enlarged. But it is important to observe the method of enlargement. In every case referred to a new nave was added at the west end. The old porch was retained in the centre, and on this a central tower was reared. With the exception of Jarrow Church, in the examples cited, the tower is of less width than the chancel and nave. At Monkwearmouth and Jarrow there are openings in both the north and south walls; in Restennet and St. Regulus the opening is in the south wall only. When church plans were brought to this stage it was but a short step farther and the transeptal form was attained. The side arches were already in existence, and all that was necessary in order to secure rudimentary transepts was to utilise the unsightly recesses on the exterior elevations by building walls across in line with the walls of the chancel and nave. Development was slower in North Britain than in South Britain or the Continent, and there was certainly no opportunity for the gradual and full realisation of the transept in Scotland because of the inflow of the great tide of advanced foreign art towards the end of the eleventh century. But it is interesting to notice that there was a movement in that direction. If in this the architects of Scotland were but following in the wake of their brethren on the Continent, a reasonable and practical theory of evolution has been established.

Here endeth the first chapter. Setting out with the expressed hope of finding the site of St. Ninian's Candida Casa, to that search I have added the desire to place the study of early church fabrics on a broader basis than I found it.

But a second chapter is still required, and for that the spade is more fitting than the pen. The task of digging must be left for others more conveniently situated. If, on the ground which I must assume to be the site of St. Ninian's Church, the spade brings to light all that has been anticipated, my leap into the dark will be amply justified. But if, on the other hand, the facts are not as I have ventured to predict, the reader may yet be pleased to think that this note has not been written altogether in vain.

"Scots Lore," it will be evident from the quotation, merits the attention of all who take an interest in archæology. The new publication is of a convenient size, and is well printed.

THE NATIONAL GALLERY.

THE annual report of the director of the National Gallery to the Treasury has appeared during the week. According to it the following twenty-three pictures were purchased during 1894:—

Portrait of a Gentleman, by Gerard Terborch; Christ before Pilate, by Rembrandt van Rijn; A Study of Still Life, by Pieter Snyers; A Laundry Maid, by Henry R. Morland; A Laundry Maid, by Henry R. Morland; The Annunciation, by Fra Giovanni Angelico; Pegwell Bay, Kent, by William Dyce, R.A.; The Mystic Marriage of St. Catherine, by Andrea Cordelle Agii; The Virgin and Child, by Ambrogio Borgognone; The Adoration of the Shepherds—The Dead Christ (a diptych), by Ercole de' Roberti; The Virgin and Child with the Infant St. John, by Filippino Lippi; supposed Portrait of Anna Maria van Schurman, by Gerard Dou; The Agony in the Garden, by Andrea Mantegna; St. Jerome in his Study, by Antonello da Messina; The Legend of St. Giles, Flemish School; A View in Haarlem, by Gerrit A. Berck-Heyde; A

Terrace Scene, with Figures, by Jan Steen; View of the Rotunda at Ranelagh, by Antonio Canale; The Baptism of Our Lord, by Pietro Perugino; The Virgin and Child with Two Saints, by Filippo Mazzola; The Dead Christ—a Pietà, by Hans Baldung; View of the Quay at Southampton, by R. H. Lancaster; Edfou, Upper Egypt, by J. F. Lewis, R.A.

The bequests and donations to the gallery were as follows:—Ippolita Torelli, by Sir Charles Lock Eastlake, P.R.A.; Portrait of Mr. Philip Sansom, by Sir T. Lawrence, P.R.A.; Portrait of Philip Sansom as a Child, by Richard Westall; Tobias and the Angel, by Adam Elsheimer; An Old Woman Sewing, Dutch School, sixteenth century; Portrait of James Northcote, R.A., by John Jackson, R.A.; Portrait of a Boy, by John Opie, R.A.; a porphyry bust of The Dying Alexander; a palette used by the late Ford Madox Brown; an illuminated initial letter, Italian School; The Holy Family, by Eustache Le Sueur; Portrait of a Lady, by Jan Anthonisz Ravesteijn; A Portrait Group, by Le Nain; St. John Leading the Virgin Mary from the Tomb, by William Dyce, R.A.; An Architectural Subject with Figures, by Domenico Beccafumi.

Mr. Henry Tate, whose wish to present his collection of modern British pictures to the nation has been long before the public, and whose gift of a building in which to house them and to form a National Gallery of British Art had been accepted by the Government, having expressed to the Chancellor of the Exchequer a desire that the collection should be under the control of the trustees and director of the National Gallery, the matter was brought before the Board at a special meeting on June 16. The Board passed a resolution that it is prepared to accept the trust and control of the Tate gift, subject to the future consideration and approval of such details respecting the management and administration of the new gallery as may be settled between the Chancellor of the Exchequer and Mr. Tate; and the trustees and director, in accordance with a request from Mr. Tate, visited his collection at Streatham, and made the selection of such pictures as they considered suitable for the national collection, and Mr. Tate consented to the exclusion of a certain small number. A deed of gift was drawn up by the solicitor to Her Majesty's Treasury, and was agreed to by the Board; at a subsequent meeting the deed was executed, and, by request of Her Majesty's Office of Works, has been returned to that Department.

The trustees and director again call the attention of their lordships to the want of space for the proper arrangement of the national collection; in many of the rooms, the early Flemish room especially, it is necessary to hang valuable pictures in places where they cannot be properly seen, still less studied; there are many branches of art in which the collection is ill represented, notably the French school of the seventeenth and eighteenth centuries, and it will shortly be impossible to find room for the necessary additions to fill up these and other gaps in the collection. Besides this, a gallery for the proper exhibition of the Turner water-colour collection, now housed in rooms on the ground floor, ill adapted for the purpose, is urgently needed. It is respectfully suggested that while waiting for the promised removal of the adjoining barracks, a small further extension of the gallery to the west might be proceeded with at once. The trustees and director would call their lordships' attention to the urgent necessity for the removal of the barracks. When it is considered that the barracks are in actual contact with the National Gallery buildings and that a fire might occur there at any moment (as actually happened some years ago at the Wellington Barracks) they trust that the priceless treasures of the national collection may not be exposed to such a risk longer than is necessary.

A rearrangement of some of the rooms in the gallery was made during the autumn. The large picture by Holbein, called *The Ambassadors*, had been standing on a screen in the Umbrian Room since its purchase in 1891, where it was out of its proper surroundings and not well seen. In order to make room for it on the wall, Room No. IV. was cleared of the early Florentine pictures, some of the most important and earliest of which were placed in the North Vestibule at the head of the stairs, a remarkably well-lighted position, and others were inserted by a readjustment in Rooms I., II. and III. The Flemish pictures were removed from Room XI. to Room IV., and so arranged as to form room for placing the Holbein, not, however, without somewhat overcrowding the room, with the result that some of the pictures in this fine collection have to be placed where they are less well seen than heretofore. Room No. XI., thus set free, was devoted to pictures of the Dutch school, many of which had been scattered in the central octagon among Italian pictures, and many on screens, where they were very ill seen. The result is the better chronological arrangement of the Florentine pictures (though for want of space this still remains somewhat imperfect), a better position for the Holbein, and an additional room, which was much wanted, for pictures of the Dutch School, and eleven screens, the use of which is always objectionable as filling up the floor-space, were dispensed with. The principle of this rearrangement was agreed on before the director left for Italy in October last,

and during his absence was carried out by the keeper, Mr. Charles L. Eastlake.

The Velazquez and the Moroni, purchased at the same time as the Holbein, had previously been hung on the wall in the Spanish and Venetian rooms respectively.

The gallery was visited by 498,182 persons on the public days during the year, showing a daily average attendance on such days (208 in number) of 2,395.

On students' days (Thursdays and Fridays) 44,643 persons were admitted between January 1 and December 1, 1894; the admission fees (at 6d. each) amounting to 1,116*l.* 1*s.* 6*d.*, as compared with 974*l.* 8*s.* received in 1893.

The total number of students' attendances at the National Gallery on Thursdays and Fridays throughout the year was 20,232. Independently of partial studies, 865 oil-colour copies of pictures have been made, viz 307 from the works of 83 old masters, and 558 from the works of 56 modern painters.

THE FINE ART COURTS, SYDENHAM.*

THE idea and design of the Pompeian Court were first suggested by Sir Mathew Digby Wyatt, the eminent architect of the India Office, Parliament Street. He made the original sketch at Naples, and he was afterwards ably assisted by Signor G. Abbati, the well-known artist of Naples, to carry out the design. It represents a restored Roman villa taken from many examples that have been unearthed in excavating the sites of the ancient towns of Pompeii and Herculaneum. It may be taken as a representation of the best style of Pompeian decoration and architecture as found in the house of Pansa, the tragic poet. The best description of the plan or arrangement of the rooms will be found in the third chapter of the first book of Bulwer Lytton's charming novel "The Last Days of Pompeii." On entering the villa the visitor first passes along a short narrow entrance, called the vestibulum, on each side of which are the apartments of the slave guards into the atrium or open hall. The first three rooms on either side are the "cubicula" or bedrooms. The two further rooms to the right and left are the business rooms. In the centre of the tessellated pavement of the hall is the "impluvium," a basin and fountain. The hall opposite to the main entrance is the "tablinum," a large saloon in which were placed the tables, with vases, chairs and candelabra. To the right of this was the winter dining-room, and behind it the summer dining-room, while on the left was the principal bedchamber of the master and mistress of the house. At the rear was the "xystus" or garden, surrounded by the "peristyle" or open colonnade. On the left of this was placed the "frigidarium" or bath, and adjacent were the kitchens and other offices.

You will observe that there is no staircase in the house. Roman villas very rarely had upper stories, or occasions for them. Some of the houses, however, at Pompeii had upper floors, but these were rarely of importance, being mere attics, or rooms for slaves, but were sometimes used by merchants for stores. If I had to describe a Roman villa in the fewest words I should say it was "like a modern house turned inside out." A modern house has its windows looking outwards towards the forecourt or street, and back windows towards the rear-court or garden, and if detached would have side windows. In a Roman villa all this is reversed; the atrium, or fore-court, and the garden, cloister-like, are inside, and the rooms all surround them, with their windows looking inwards, the four external walls having no window openings whatever. This was done for protection. The Roman warned you at the entrance to "Cave canem"—"Beware of the dog," and his walls were built, "Defensio non provocatio," or, as our Volunteer friends would say, in a spirit of "Defence, not defiance."

Pompeii and Herculaneum, the two cities that were destroyed A.D. 79, were situated about five miles east of Naples, and contained conjointly a population of about 10,000 persons. Herculaneum, the larger town, about twice the size of the other one, and lying nearer to Mount Vesuvius than Pompeii, was covered with the stream of boiling lava, beneath which it still lies buried. Pompeii had, sixteen years previously, suffered severely from an earthquake, on February 5, A.D. 63; but on August 23, A.D. 79, the two towns were completely destroyed and buried by a violent eruption of Mount Vesuvius, when the elder Pliny lost his life. The best account of the event is given in a letter by Pliny the younger, his nephew, to Tacitus, the celebrated historian. He commences:—"To Tacitus,—Your request that I would send you an account of my uncle's death, in order to transmit a more exact relation of it to posterity, deserves my acknowledgments, for if this accident shall be celebrated by your pen, the glory of it, I am well assured, will be rendered for ever illustrious." He goes on to say that his uncle "was at that time with the fleet under his command at Misenum. On August 23 my mother desired him to observe

a cloud which appeared of a very unusual size and shape." It was found afterwards to ascend from Mount Vesuvius. "I cannot give you a more exact description of its figure than by resembling it to that of a pine tree, for it shot up a great height in the form of a trunk, which extended itself at the top into a sort of branches, occasioned, I imagine, either by a sudden gust of air that impelled it, the force of which decreased as it advanced upwards, or the cloud itself, being pressed back again by its own weight, expanded in this manner." He then proceeds to detail the circumstances of his uncle's death. In another account he says:—"Though it was now morning the light was exceedingly faint and languid, the buildings all around us tottered, and though we stood upon open ground there was no remaining there without certain and great danger; we therefore resolved to quit the town. Having got to a convenient distance from the houses, we stood still in the midst of a most dangerous and dreadful scene. The chariots which we had ordered to be drawn out were so agitated backwards and forwards, though upon the most level ground, that we could not keep them steady, even by supporting them with large stones. The sea seemed to roll back upon itself, and to be driven from its banks by the convulsive motion of the earth; it is certain, at least, that the shore was considerably enlarged, and several sea animals were left upon it. On the other side a black and dreadful cloud, bursting with an igneous serpentine vapour, darted out a long train of fire resembling flashes of lightning, but much larger. The ashes now began to fall upon us. I turned my head and observed behind us a thick smoke, which came rolling after us like a torrent. We had scarcely stepped out of the path when darkness overspread us, not like that of a cloudy night or when there is no moon, but of a room when it is shut up and all the lights extinct. Nothing then was to be heard but the shrieks of women, the screams of children and the cries of men; some calling for their children, others for their parents, others for their husbands; one lamenting his own fate, another that of his family; some wishing to die from the very fear of dying, some lifting their hands to the gods, but the greater part imagining the last and eternal night was come, which was to destroy the gods and the world together. The fire fell at a distance from us, then again we were immersed in the thick darkness, and a heavy shower of ashes rained upon us which we were obliged every now and then to shake off, otherwise we should have been crushed and buried in the heap. At last this dreadful darkness was dissipated by degrees like a cloud of smoke, the real day returned, and even the sun appeared, though very faintly, as when an eclipse is coming on. Every object that presented itself to our eyes seemed changed, being covered over with white ashes as with a deep snow."

Pliny, junior, also recounts in his letter to Tacitus how they went out, having pillows tied upon their heads with napkins, and this was their whole defence against the storm of stones that fell round them. Another writer, Dion Cassius, says:—"Day was turned into night, and light into darkness; an inexpressible quantity of dust and ashes was poured out, deluging land, sea and air, and burying two entire cities, Herculaneum and Pompeii, while the people were sitting in the theatre."

Bulwer Lytton says:—"The whole elements of civilisation were broken up. Ever and anon, by the flickering lights, you saw the thief hastening by the most solemn authorities of the law, laden with, and fearfully chuckling over, the produce of his sudden gains. If in the darkness wife was separated from husband, or parent from child, vain was the hope of reunion. Each hurried blindly and confusedly on. Nothing in all the various and complicated machinery of social life was left save the primal law of self-preservation."—(From "The Last Days of Pompeii.")

All this happened in the reign of Titus, the conqueror of Jerusalem.

Speaking of the villas, Signor Abbati, the artist I have already mentioned, says:—"It should be borne in mind that the dwellings of Pompeii are by no means adequate to present a complete idea of the magnificence of imperial Rome or of the sumptuous habitations of those who were regarded as the conquerors of the world, since Pompeii was no more than a city of the third rank. When, however, we perceive in the dwellings of the small city the admirable distribution of the various apartments, the purposes to which they were respectively devoted, the abundant supply of the luxuries and elegancies of life, the love of order, and the exuberance of art which they display, we cannot but remain impressed with wonder—and how much would that wonder be increased should we endeavour to form a notion of the great capitals of the country and of the residences of its consuls and emperors."

I will conclude with one more extract from Bulwer Lytton: "Pompeii was the miniature of the civilisation of that age. Within the narrow compass of its walls was contained, as it were, a specimen of every gift which luxury offered to power. In its minute but glittering shops, its tiny palaces, its baths, its forum its theatre, its circus—in the energy yet corruption, in

* A paper read by Mr. W. F. Potter, architect, at the visit of the members of the Upper Norwood Athenæum to the Crystal Palace.

the refinement yet the vice, of the people—you beheld a model of the whole empire. It was a toy, a plaything, a show-box, in which the gods seemed pleased to keep the representation of the great monarchy of the earth, and which they afterwards hid from time, to give, to the wonder of posterity, the moral of the maxim, 'that under the sun there is nothing new.' A very excellent illustration and description of the Pompeian Court appeared in *The Builder*, January 7, 1854.

To write a paper on each of the courts would fill a volume, and occupy too much time, as each one would occupy as much space, at least, as my short description of the Pompeian Court. I will, therefore, simply give a schedule or list of the chief wonders or objects of interest in each court.

The Egyptian Court

contains the celebrated rock-cut Temple of Karnak, or Hall of Columns, discovered by Belzoni in 1817. Here is also the famous Rosetta stone (in plaster). The original, now in the British Museum, was discovered by a French engineer in 1799, and bearing an inscription in hieroglyphic as well as Greek characters, gave Dr. Young a clue to translating ancient Egyptian hieroglyphics generally. Egypt is regarded as the parent of art.

Grecian Court.

This court contains the model of the Parthenon, built of marble at Athens. This celebrated structure was the most perfect example of Grecian architecture; it remained perfect till 1687, when, being used by the Turks as a powder magazine, an explosion occurred, which laid it in ruins. The friezes were removed to England by Lord Elgin, and are sometimes called the Elgin marbles. They are now in the British Museum.

The Roman Court.

Here is a model of the Colosseum, the largest of the Roman amphitheatres, commenced by Vespasian, and completed by his son, Titus, A.D. 80. The façade of this court is of Doric, with the round arch, the lowest feature of the Colosseum, whose second tier is of Ionic and the third of Corinthian columns. Observe the statue of Hadrian.

The Alhambra Court

was designed and constructed by Mr. Owen Jones, architect, from models brought by him from Spain. This court was destroyed by fire in 1866, but has been restored at great cost.

Romanesque Court.

Among other gems of art this court contains restored copies of the monuments of our earliest monarchs, the celebrated effigies of Fontevrault Abbey, in France, the burial place of the Plantagenets, consisting of Henry II. and his Queen Eleanor of Guienne, Richard Cœur de Lion and his Queen Berengaria. Here are also King John, from Worcester, and his Queen Isabella. The Emperor Napoleon III. offered to give the monuments now at Fontevrault to Queen Victoria, but the French press raised such an opposition to the proposal that Her Majesty waived her claim.

The Gothic Courts.

These contain copies of the famous doorway from Nuremberg and the abbey front at Tintern, Netley Abbey and Rochester doorway. These and other specimens have been reproduced under the superintendence of Sir Mathew Digby Wyatt, architect.

The Elizabethan Court

contains the façade of Holland House and the tombs of Queen Elizabeth and Mary Queen of Scots.

I have now come to the length of my tether, or rather end of my paper, but I shall not cry, like Alexander the Great, because there are no more worlds to conquer; on the contrary, I have rather been suffering from an *embarras de richesses*. There are still other gems, the Renaissance Court and the Italian Court, for instance, but if there are any objects of interest I have omitted, I would suggest that some of our younger friends take up the subject where I leave off, and if this were done by half a dozen members consecutively for the next six years, there would still be left something to write about and discuss both inside and outside the Crystal Palace.

DURHAM CATHEDRAL.

AT the annual meeting of the Durham and Northumberland Archaeological and Architectural Society the president, the Rev. Dr. Greenwell, proposed to hold an extra meeting at Durham. There had been, he said, important discoveries made in Durham Cathedral, namely, the remains of the east end of Carileph's Church. Before mentioning anything in connection with those remains, he thought it desirable to say that the discovery was made purely by accident. Several erroneous statements had been made respecting the discovery, but he repeated that it was purely accidental. A hole was made at the east end of the south aisle of the choir in connection with a proposed heating apparatus. Several other and similar holes

were made in other parts of the church. Whilst this was going on he accidentally went into the church, and his attention was drawn to the hole at the east end of the south aisle of the choir. When the wall was exposed he noticed a very remarkable piece of ashlar work, and thought it rather a curious thing for ashlar work to be there. It was entirely owing to his coming there at the moment that the place was not filled in at once. He asked the workmen to go down a little lower. They did so, and, as he had explained, by pure accident they came upon the head of the apse. The digging operations were carried on a little further, and the whole thing was brought to light. He might explain that previous to this he obtained the consent of the dean to make excavations on the platform behind the Neville screen. He got so far as to chalk out where it was intended to excavate, and was only waiting for a favourable opportunity when the workmen could be spared to begin. In the meantime this accident disclosed the apse of Carileph's Church. The excavations if carried out would unquestionably have resulted in the finding of the apse. It had been said, and he thought quite wrongly, that it was a portion of Aldhune's Church, that it was really the apsidal termination of that church. That had been completely set at rest so far as the excavations had been carried out. It was conclusively shown that it was not part of Aldhune's Church, but the termination of the aisles of the choir of Carileph's Church. This set at rest the whole controversy as to how the church commenced. There was nothing like the pick and spade to settle controversies of this character. They had settled the question of the three apses of the church of Durham. He proposed that they should have as soon as possible a meeting in the cathedral, when the whole subject would be entered into with special reference to the apsidal termination of the east end of Carileph's Church. That he proposed to be a special meeting and, as he said, to be held as soon as possible, and that he undertake to give the historical part; he did not mean to say the history of the Church of Durham, or anything connected with the history of Christianity or the Church of Durham ecclesiastically considered, but simply the history of the church as a building. He would endeavour to bring before them as far as he could, and as far as they had any records, all that was stated by various writers with regard to the various parts of the church of Durham, the building and architectural parts of the church, and to explain and thoroughly go into the whole question with regard to the eastern termination and the vaulting of the choir, which was a matter of very great importance and of very great dispute, as to whether it was vaulted as early as 1140 or at a later time. However, he need not enter into that question at present. The late discoveries were of so very great importance that they would all be glad to have an opportunity of having another meeting in the church, and taking these things into consideration, and also at the same time going through the whole of that very grand building.

The president afterwards spoke about the restoration of the chapter-house at Durham. In his opinion there ought, he said, to be restored the windows that were in the chapter-house at the time of its destruction in 1796. Instead of these there had been inserted Norman windows, which were of course without any authority. The discovery of the original keystone showed that the vaulting of the ribs was entirely wrong. If Carter's drawings and Carter's plan had been examined, it would have been at once seen that the ribbing put up is different and did not look anything like so well. Next turning his attention to the Galilee, the president said that the sharpness of the fine mouldings in the Galilee was rapidly disappearing in consequence of the fumes from the stoves. Dr. Greenwell proceeded to speak very strongly about there being students' rooms on the Norman gallery of the castle, and expressed the conviction that, unless a change was effected, sooner or later the whole place would be burnt down, the gallery being entirely of wood. He hoped the University authorities, who had plenty of rooms elsewhere, would remove the students from so very dangerous a part of the building, for in his opinion if fire once broke out there, nothing on earth would be able to check it.

THE ART OF CASTING BRONZE IN JAPAN.*

(Concluded from last week.)

FOR a little more than three-quarters of a century we have another golden age in its history, during which a succession of brilliant artists, distinguished by marvellous technical skill and originality of design, worthily maintained the best traditions of the founder's art, and Japan attained a position in *cera perduta* casting which she had never reached before.

Two men, Seimin and Toun, stand out prominently during the closing years of last century and the first quarter of the

* A paper by Mr. W. Gowland, A.R.S.M., F.C.S., F.S.A., late of the Imperial Japanese Mint, read before the Applied Art Section of the Society of Arts on Tuesday, April 23, 1895.

present. Others, among whom should be mentioned Harutoshi, Kunihisa, Kamejo, Teijo, Tauchi, approach these great masters in skill, even occasionally proving their equals.

In examining their works it will be noticed that, as among the painters, several were specially distinguished for their skill in the representation of certain motives. Sosen as a painter of monkeys, Ganku of tigers, Okyo of carp, &c., so among the founders several are similarly renowned; thus Seimin chiefly owes his fame to the perfect modelling of his tortoises, Toun and Somin for the vigour and life expressed in their dragons, and Kamejo for the delicate and truthful rendering of her quails. It is needless to say that they did not confine themselves to these, but executed other works not less demonstrative of their skill.

The human figure, however, does not form part of their naturalistic studies. The forms and movements of lower animal life are expressed with a truthfulness which has never been surpassed, but in representing man they seem rarely to have been able to free themselves from the conventionalities of the art dogmas of the old Sinico Japanese schools, and seldom show even traces of that close observation of nature which characterises their other works.

Portrait statues are of extreme rarity, those representing famous personages being merely conventional creations which are supposed to portray the type or class to which they belonged rather than the individuals themselves. This example would seem to be one in which an attempt has been made to produce with truthfulness a characteristic likeness of the man whom it is intended to commemorate.

With the death of the last representative of this brilliant group of art founders, near the end of the first half of the present century, the art gradually passed into a stage of decadence, the lowest depths of which it but recently reached, and from which it is only just emerging.

Vast numbers of bronzes have indeed been cast, but they are too often of meretricious design and tawdry ornament, or debased copies of the creations of Seimin, Taün and their distinguished contemporaries. Fortunately there are a few notable exceptions to this latter statement. In the first decades of the second half of this century Dosai, Gido, Somin, Jsun, Tanchosai, Toryusai did much excellent work, and ably sustained under considerable difficulties the reputation of their famous predecessors. Among more recent founders a distinguished position should be given to Suzuki Chokichi (now living), whose well-known magnificent example of *cera perduta* casting is in the South Kensington Museum. It is an ancient incense-burner with doves and peacocks, the doves especially being masterpieces of modelling, and an embodiment in bronze of the highest developments of the naturalistic school, of which Chokichi is an earnest and ardent follower.

And here I should like to say a word on the excessive crude and vulgar ornament which disfigures too many modern Japanese bronzes. Such ornament is never found on any vase, brazier, or other object intended for use by the Japanese themselves, but is confined to those articles specially made for sale to foreigners. These are all veritable "pot-boilers" cast by men often capable of doing better things, who earn more by the production of these vulgar monstrosities for exportation than others who still endeavour to follow the simple canons of Japanese art. Modern Japanese bronze-founders, like their brethren in pictorial art, hence work in an adverse environment, and under many disadvantages unknown to their predecessors. In the early centuries religious enthusiasm, the quiet seclusion of the monastery, and the patronage of a powerful priesthood, stimulated, fostered and supported the old artists in their work, so that all their powers were put forth in the execution of the grand masterpieces of those times.

In later times the same result was achieved under the system of feudalism which prevailed in the country. Workers in bronze were attached to the courts of the greater daimyos (territorial nobles), their incomes were secure, they were free to work out their designs as they wished, and need only do so when they felt inspired.

During recent years the Emperor has done much for the encouragement of a select few of the chief art workers in bronze in the revival of their old art, the result being that some of the objects of modern work which adorn the imperial palace are of extreme beauty, and equal those of the older masters in grace, fulness of form and sobriety of ornament. But for the great majority there is no such patronage; yet the bronze-founders must live, and to live means for too many that they must waste their talents in producing work in designing which they are hampered by the demands of commerce, and the chief, or rather sole, end of which is merely pecuniary remuneration. Up to the eighteenth century we rarely find the name of the artist or founder attached to any bronze. Most of the existing specimens of the earlier bronzes were made, as we have seen, for use in the ceremonies and ritual of the Buddhist religion, and were not usually allowed to bear any name, excepting when they were "ex voto" offerings, and then only the names of the donors. The records of the

temples are also silent with few exceptions, even on the authorship of the grand masterpieces to which they often owe their popularity and fame. The dedicators alone are remembered and the artists forgotten. Being almost invariably men of plebeian origin, the bronze-founders occupied a lower status in life than the calligrapher, painter, or armourer, and their lives have not been thought worthy of record; all the knowledge we have of even the great masters of the last generation is derived solely from their works.

Several charming specimens of both the larger and smaller bronzes—especially of the latter—as late as the last hundred years, are unfortunately not signed (especially the candlestick of fine open work lent by Sir Trevor Lawrence), and many of equal merit are signed by artists whose names do not appear in the lists of noted bronze-workers. So that the materials for a history of the men themselves—such as has been compiled of their fellow-artists, the painters—do not exist, and are but scanty and incomplete even for a record of their works.

ORFORD CHURCH RESTORATION.

THE following letter has been addressed to the committee for "restoration" by a recipient of their printed appeal for subscriptions:—

GENTLEMEN,—I have received your circular appealing for subscriptions to "restore" that priceless jewel, your lovely parish church. I am referring to the glorious portion of the fabric which remains as yet intact, and almost as its gifted creators left it.

Visiting the church a year ago I was charmed with the boarded-off portion (nave, north aisle, chancel, tower, south porch, &c.), and pray you to leave it as it is—with such repairs solely as are requisite for its maintenance—as a supreme work of art.

Surely the disastrous depravation of the south aisle as now "restored" is glaring enough to discourage further excursion in that direction—vulgar modern ecclesiastical small wares hideously out of place, the beautiful ancient-carved seats crucified against the walls, or against appalling stacks of hot-water pipes, slowly destroying them, their places usurped by rapid modern imitations. What has been so handled is dead for ever—sacrificed on the cruel altar of modern folly.—I am, yours faithfully,

Leek: May 1, 1895.

LARNER SUGDEN.

THE CHORLTON HOMES COMPETITION.

THE award has been made in the competition for the above, and the prizes have been allotted as recommended by the assessor, Mr. John Macvicar Anderson. In a subsequent letter to the Guardians Mr. Anderson, after further consideration, recommended that the third prize should be given to the designer of "Village Homes."

"A Home," first prize, Messrs. Charles Clegg & Son, of 104 King Street, Manchester; "Q. E. D.," second prize, Mr. J. W. Beaumont, of 10 St. James's Square, Manchester; "Village Homes," third prize, Messrs. W. Telford Gunson & Sons, of 10 Harsden Street, Manchester.

Mr. Anderson in his report says that so far as merit in design and adaptability is concerned he has no hesitation in placing the plans of "Snowflake" first, but as in these accommodation is only shown for 286 children, instead of 300, he has in consequence reluctantly felt compelled to disqualify the same for a prize.

The Guardians have, however, decided to adopt the plans of "Snowflake," whose author, Mr. J. B. Broadbent, of 1 Princess Street, Manchester, has been entrusted with the carrying-out of the work.

The following is the award:—

Gentlemen,—I have carefully examined each one of the eighteen sets of designs which have been submitted in competition for the proposed cottage homes and schools in the township of Styal, Cheshire, and so far as merit in design and adaptability for the purpose of the buildings are concerned, I have no hesitation in placing the designs in the following order, viz.:—

No. 1, Snowflake; No. 2, A Home; No. 3, Q. E. D.

It is, however, extremely unfortunate that the author of Snowflake provides accommodation for 286 children only, the condition of the competition being that "Provision is required at present for 300 children in cottages designed to accommodate not more than twenty in each;" and, further, that "First cottage to be at entrance gates, and to also act as the receiving wards."

The first cottage in the design of "Snowflake" is at the entrance gates, but it provides accommodation for six children only in place of twenty, leaving a deficiency of fourteen.

In these circumstances I am with great reluctance com-

pelled to disqualify the design of "Snowflake," and I accordingly assign the first place in the competition to the author of the design which bears the motto "A Home," and the second place to the author of the design which bears the motto "Q. E. D."

As coming next in point of merit, I would mention the designs marked respectively "Sunshine" and "Village Homes," although in the plans of the former I can find no room for sewing, which is one of your requirements, and in the latter the plan of the cottage homes is defective.—I have the honour to be, Gentlemen, your obedient servant,

(Signed) J. MACVICAR ANDERSON.

Manchester: May 1, 1895.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the meeting of the Edinburgh Architectural Association, Mr. W. W. Robertson, president, in the chair, Mr. John Burn read a paper on plumbing, and he discussed in a technical way the questions connected with all kinds of inside and outside plumber work. Discussion followed. One point which was a good deal debated was the comparative merits of lead and zinc for roofing purposes. Most of the speakers favoured the use of lead. The value to be attached to the use of safety valves on kitchen boilers also came in for a good deal of notice. Most of the speakers advocated the use of the safety valve, but one speaker declared that he was invariably opposed to its use. It was, he said, a trap which led people into trouble by the valve getting stiff and unworkable. The proper safety valve was to have the pipes properly protected, so that there would be no risk of their being frozen. Some of the blame of the freezing of pipes was attached by certain of the speakers to the practice of having the pipes conducted through the house in chases which were mere ventilating shafts of cold air, but it was pointed out that a draught in the chase could be avoided by having the woodwork fitted close in to the pipes at each floor. There was a consensus of opinion that the cisterns should be so placed as to be accessible to the occupier of the house as to the plumber himself. Two or three of the practical plumbers remarked how much the introduction of drawn lead traps had occasioned the loss of practice among plumbers in the working of lead, and was consequently a bar to the education of the apprentice. At the close of the discussion the Association, on the motion of the Chairman, seconded by Mr. H. J. Blanc, adopted a resolution declaring that the Association recognised the efforts of plumbers to increase the efficiency of their trade by educational and other influences, and viewed with approval a system of registration such as that adopted by the Society for National Registration of Plumbers and by the Scottish Society for the Registration of Plumbers.

Manchester Municipal Technical School Competition.

SIR,—I enclose copy of correspondence which has taken place between Mr. Alfred Waterhouse, R.A., assessor in the above competition, Messrs. Spalding & Cross, authors of the first premiated design, and myself, and I do so in the hope that you will publish the letters and this communication, in order that the serious attention of the profession, the Institute and Association should be drawn to the matter.

The following were two of the conditions issued to competing architects by the Corporation of Manchester:—

"Due regard, however, must be paid to the amount of accommodation asked for, and to the cost, which should not exceed 75,000*l.* The Corporation reserve to themselves the right of verifying any estimate and disqualifying any design which they may consider likely to exceed the estimated cost by more than 5 per cent."

"No distinguishing mark, motto, or device must be put on the drawings, description statement, envelope or case by the competing architects or their agents."

You will perceive on perusing the correspondence that the condition as to limit of cost making the outside amount to be expended as 78,500*l.* has been ignored, this amount being nearly doubled, and that the condition as to "distinctive marks" was distinctly infringed, apparently with impunity, as Messrs. Spalding & Cross, in their letter of March 23, stated that "the assessor's attention was drawn to the matter before the award was made," although this is denied by Mr. Waterhouse, who, in his letter of April 25, says:—"If I had

noticed such a mark, and thought it was there for the purpose you intimate (the italics are mine), I should have rejected the design."

I intimated nothing as to the purpose for which the mark was there, but the fact remains that it was there, and that it has since been patched over and the sky washed over it to cover the patch.

It seems to me desirable for all parties that a satisfactory explanation should be forthcoming.—I am, sir, yours faithfully,

ERNEST RÜNTZ,
Author Third Premiated Design.

22 Moorgate Street, London, E.C.: March 22, 1895.

Gentlemen,—I enclose a copy of the Manchester *City News* of the 2nd inst., on page 6 of which you will find marked a statement to which I beg to draw your attention, as it not only concerns yourself but competitors generally. I shall esteem it a favour if you will kindly inform me whether there is any truth in the statement above referred to.—I am, gentlemen, yours faithfully,

(Signed) ERNEST RÜNTZ.

Messrs. Spalding & Cross.

22 Moorgate Street, London, E.C.: March 22, 1895.

Dear Sir,—I enclose a copy of the Manchester *City News* of the 2nd inst., on page 6 of which you will find marked a statement to which I beg to draw your attention, as it not only concerns yourself but competitors generally. I shall esteem it a favour if you will kindly inform me whether there is any truth in the statement above referred to.—I am, dear sir, yours faithfully,

(Signed) ERNEST RÜNTZ.

Alfred Waterhouse, Esq., R.A.

"I will say little about the competition for the Technical School, but Alderman Clay made a statement which caused great astonishment. Pointing to a plan of the building, he said, 'When that plan was put in competition it had a mark on it which distinguished it from all the others.' Two members of the committee stated that they did not know by that mark whose plan it was. Probably not; but it ought to have been rejected, because it had a mark in violation of the published conditions."—Extract from letter signed "Zadok" in Manchester *City News* of March 2.

15 Queen Street, Cheapside, E.C.: March 23, 1895.

Dear Sir,—In reply to yours, dated yesterday, enclosing a Manchester paper, we write to say, in reference to the question you raise, that there is not an atom of truth in it. There were no marks on our plans, but the draughtsman who prepared the perspective view put the arms of the city on it; but this was done out of our office, and without our knowledge in any way.

Mr. Waterhouse's attention was drawn to the matter before the award was made, and he evidently did not consider it violated the conditions of the competition, &c.—We remain, yours faithfully,

(Signed) SPALDING & CROSS.

Ernest Rüntz, Esq.

Crewe Arms Hotel, Crewe: March 25, 1895.

Dear Sir,—In answer to your letter of the 22nd, relative to an alleged mark on the selected design in the recent Technical School Competition, Manchester, I did not observe any such distinctive mark on any of the designs sent in, and most certainly I should have set any design aside having such mark, had I observed it.—Yours faithfully,

(Signed) A. WATERHOUSE.

Ernest Rüntz, Esq.

22 Moorgate Street, London, E.C.: April 2, 1895.

Dear Sir,—I beg to acknowledge with thanks receipt of your letter of the 25th ult. with reference to the statement in the Manchester *City News* of March 2 last.

Simultaneously with my former communication to you I sent a similar letter to Messrs. Spalding & Cross, and now enclose a copy of their reply, dated March 23, in which you will see they admit a distinctive mark was upon one of their drawings, and state that your attention was drawn to it.

I am not writing this in any captious spirit, but because it is a matter that should be thoroughly cleared up, bearing in mind the stringency of the conditions of the competition in question.

Whilst upon this subject may I also ask whether the condition stating that any design which was deemed by the assessor as likely to exceed the sum of 75,000*l.* by 10 per cent. was framed to be broken or adhered to, my reason for asking being that a tender for the schools amounting to 141,500*l.* has, I am informed, been accepted. I hear that a storey has been added to the original design, but this would hardly absorb 60,000*l.*, and the original design would therefore appear to largely exceed the stipulated cost of 75,000*l.* plus 10 per cent.

I am raising these points not alone on personal grounds, but in the interests of all who enter for competitions, as it is most disheartening for any architect who conscientiously strives to send in designs in strict conformity with published conditions to find any of them ignored in the final selection by the assessor. Awaiting the favour of a reply, I am, dear sir, yours faithfully,

(Signed) ERNEST RÜNTZ.

Alfred Waterhouse, Esq., R.A.

22 Moorgate Street, London, E.C.: April 11, 1895.

Gentlemen,—I am obliged to you for your letter of the 23rd ult., a copy of which I forwarded to Mr. Waterhouse, with whom I had previously communicated. I happened to visit Manchester last week, and whilst there a most extraordinary statement was made to me o

the effect that the distinctive mark of the arms of the Corporation of Manchester upon your perspective drawing (to which you refer in your letter) had been cut out; the drawing, I understand, is hung in the existing Technical School. I shall be glad if you will kindly inform me whether there is any foundation for such a statement.—Awaiting the favour of a reply, I am, gentlemen, yours faithfully,
Messrs. Spalding & Cross. (Signed) ERNEST RÜNTZ.

15 Queen Street, Cheapside, E.C.: April 11, 1895.

Dear Sir,—In reply to yours of this date, the perspective drawing to which you refer has remained with the committee since the competition was decided, and we have not touched it, nor dealt with it in any way. We think this correspondence must now cease.—Yours sincerely,
(Signed) SPALDING & CROSS.

Ernest Rüntz, Esq.

22 Moorgate Street, London, E.C.: April 16, 1895.

Gentlemen,—I beg to acknowledge receipt of your favour of the 11th inst. You appear to have misunderstood my last letter informing you of a certain statement as to the distinctive mark having been cut out from your perspective drawing. I have not suggested that the drawing has been again in your possession, neither have I directly or indirectly charged you with having tampered with it or dealt with it in any way, as you apparently assume; all I wish to know from you is, whether there is any truth in the statement quoted in my letter to you of the 11th inst., without reference to the person or persons (if any) responsible for the alleged mutilation of the drawing in question. A direct answer to this inquiry will in all probability close the correspondence as far as you are concerned.—I am, gentlemen, yours faithfully,
(Signed) ERNEST RÜNTZ.

Messrs. Spalding & Cross.

22 Moorgate Street, London, E.C.: April 22, 1895.

Gentlemen,—I shall be much obliged if you will favour me with a reply to my letter of the 16th inst.—I am, gentlemen, yours faithfully,
(Signed) ERNEST RÜNTZ.

Messrs. Spalding & Cross.

15 Queen Street, Cheapside, E.C.: April 22, 1895.

Dear Sir,—We do not know that we have anything to add to our former letter except to remind you that the drawing to which you allude is the absolute property of the Manchester Corporation, and that therefore you should refer to them for any information.—Yours faithfully,
(Signed) SPALDING & CROSS.

Ernest Rüntz, Esq.

22 Moorgate Street, London, E.C.: April 23, 1895.

Dear Sir,—I beg to enclose copies of correspondence which has passed between Messrs. Spalding & Cross and myself since my letter to you of the 2nd inst. relative to the distinctive mark upon their perspective drawing submitted in the above competition.

You will see that I have failed to obtain from them a direct reply to a very simple question arising from a statement made to me when last I visited Manchester.

I presume you have been away from town, which would account for the absence of a reply to my letter of the 2nd inst. I hope and indeed think I am not exceeding my rights as a competitor in asking you to elucidate a matter which in its present phase is far from satisfactory, and I shall be much obliged if you will let me hear from you upon the various questions raised in relation to the subject of my letters at your convenience.—I am, dear sir, yours faithfully,
(Signed) ERNEST RÜNTZ.

Alfred Waterhouse, Esq., R.A.

20 New Cavendish Street, Portland Place, W.:
April 25, 1895.

Dear Sir,—I have, as you surmise, been away from home, and have only just returned to town. You will readily understand that an assessor hardly feels himself bound to answer all the letters that he may receive from competing architects, and, further, I did not consider that your letter of the 2nd required a reply, for I believe I had before informed you that I did not observe any distinguishing mark on Messrs. Spalding & Cross's design. If I had noticed such a mark, and thought it was there for the purpose you intimate, I should have rejected the designs. Your other question I hardly think it necessary for me to answer. The cost of a building is, of course, one of the most important points an assessor in an architectural competition has to give his attention to, but he cannot give any sort of guarantee that the designs he may select for prizes will be built within their authors' estimates, nor even within his own, the development of the design preparatory to obtaining tenders for its execution resting not with the assessor but with its author, and I hear that the building in question has been added to and altered in a variety of ways since the competition.—Yours truly,
(Signed) A. WATERHOUSE.

Ernest Rüntz, Esq.

NEW BUILDING.

Cardiff.—On Saturday last Lord Tredegar opened the new Children's Home at Roath, Cardiff, which has just been completed for St. Margaret's Sisterhood, East Grinstead. The Bishop of Llandaff performed a short dedicatory service in the presence of the Reverend Mother Superior and a large gathering of the clergy and laity of the neighbourhood. The new buildings stand on a site half an acre in extent, adjoining St. Margaret's House of Mercy, the freehold of which has been very generously given by Lord Tredegar. The design is plain and unpretentious, in a modern Domestic style, Gothic in feeling, architectural effect being obtained by the judicious

admixture of Bath stone and Ruabon red pressed brick dressings, with moulded brick strings and cornices, and Maesy-cymmer stone shoddies for the facings. A sculptured figure in Portland stone, representing St. Margaret, by Mr. Wormleighton, of Cardiff, is placed in a niche in the front elevation; and the same artist has executed the bold incised work in the cement panels of the half-timbered centre gable. Accommodation is provided for thirty children. On the ground floor are provided spacious entrance hall, with waiting-room, sitting-room, work and play rooms, and refectory, with storeroom, kitchen, scullery, larder, and the usual offices. There is a small laundry attached, consisting of washhouse and ironing-room, both spacious, airy and well ventilated. A side entrance is provided for the children, with lavatory and cloak-room attached, and there is also a separate entrance to the laundry and a covered way uniting the home with the private chapel connected with the House of Mercy. On the first floor are two large dormitories, with attendants' bedroom between, guest chamber, bathroom and small infirmary, which can be isolated in case of necessity. On the second floor are two large dormitories for the elder girls on the cubicle system, each cubicle having a separate window, and through ventilation is obtained by windows reaching to the ceiling at either end. There is a bedroom for the sister-in-charge, and also a bathroom, linen-closet and storeroom on this floor. The buildings have been carried out at a cost of about 2,300*l.* by Messrs. Shepton & Son, of Cardiff, from designs and under the personal superintendence of the architects, Messrs. Veall & Sant. Mr. Wm. Beese was contractors' foreman. The tiles for floors were supplied by Wooliscrofts, Hanley; the grates by John Williams & Sons, Cardiff; the tile-hearths by Godwin, Lugwardine; and the lead lights by Mr. S. Evans, West Smethwick. The buildings form a valuable addition to the sisterhood's establishment at Roath, especially in the concentration of the admirable rescue work which has been going on here for the last thirteen years under the careful supervision of Sister Esther.

GENERAL.

Plans have been prepared by Mr. T. G. Abercrombie, architect, of Paisley, for the proposed new infirmary at Paisley.

An Amateur Art Exhibition, organised for charitable purposes, was opened by the Duchess of York on Monday afternoon, at Moncorvo House, Ennismore Gardens.

The Indian Government have ordered a massive granite obelisk, which is to be erected over the remains of the British officers who were the victims of the Manipur massacre.

Sir John Millais's picture, *St. Stephen*—a prominent feature in the Royal Academy Exhibition—has been bought under the regulations of the Chantry Bequest by Mr. Tate, who has consented to lend it at Manchester, to be shown at the autumn exhibition.

The Government have commissioned Mr. Thornycroft to execute a large statue of Cromwell. The statue will probably be placed at Westminster.

Papers will be read at the meeting of the Royal Meteorological Society on Wednesday, the 15th inst., by Mr. G. J. Symons and Mr. G. Chatterton, on "The November Floods of 1894 in the Thames Valley."

A Memorial Fountain in honour of Sir Charles Cameron, M.P., is to be erected on a site in Woodside Crescent, Sanchiehall Street, Glasgow. It will cost 600*l.*

The Death is announced of ex-Provost Brown, of Paisley, who was connected with the Society of Antiquaries of Scotland, and wrote several historical works on Paisley and the district.

The French Government have purchased Mr. Brangwyn's painting, *A Market on the Beach*, which is now being exhibited in the Salon.

Lord Egerton of Tatton has decided that the anniversary festival of the Royal Masonic Institution for Boys will be held on July 3. The annual sports will be held at Kempton Park on June 8.

The Bells of Crowland Abbey, Lincolnshire, where it is recorded that the first peal of bells was ever rung in England, have been rehung.

A Roman Well was discovered during the building operations on the site of the Roman Camp, Segedunum, at Wallsend.

Captain Abney, C.B., will read a paper before the Society of Arts on next Wednesday, his subject being "Means for Mitigating the Fading of Pigments."

The Bequest of 1,000*l.* by the late Captain Macdonald for the erection of a monument in Inverness in memory of Flora Macdonald, who aided in the escape of the Pretender, has now been placed on deposit to the credit of the Town Council and the trustees of the deceased, Mr. Justice Stirling having pronounced the bequest to be valid.

The Architect.

THE WEEK.

THE position of the works committee of the London County Council is at present rather dubious, since the following motion was rejected at the meeting on Tuesday:—"That in the cases in which the actual cost of the works has exceeded the original or amended estimates the amount expended in connection with the works be approved; and that the works committee be instructed to prepare and bring up a report to the Council making suggestions for preventing estimates being exceeded in future, and do also report forthwith the particulars of the jobbing works done during the existence of the committee, together with the values placed upon such works by the officer under whose orders and directions such jobbing works have been carried out. That the Council, having considered the report by the architect on the statements affecting his department contained in the report of the manager of works, finds no reason for attributing to the architect or his department any responsibility for the increased cost of the buildings erected in Yabsley Street and Blackwall Lane." The natural consequence of the defeat should be to withhold the entrusting of additional works to the committee. But by one of those volatile transitions which betray the weakness of the Council as a governing body, it was immediately afterwards decided to allow the works committee to erect a block of dwellings on the Boundary Street area. The committee are not hampered in any way about the cost of the building, and the ratepayers must therefore expect to have to pay an exorbitant price for the privilege of possessing amateur contractors and a body of idle workmen who will not obey orders.

THE late Mr. JAMES PIERS ST. AUBYN, who died last week at Marazion in his eighty-first year, enjoyed more than a local reputation as an architect. As he held the office of surveyor to the Middle Temple for over thirty years, it is evident that his reputation had extended to the Metropolis. By birth he was a native of Worcestershire, for he was born in Powick, of which parish his father was vicar. In Devon and Cornwall he was much occupied with church building and restoration. He erected also several mansions, which were equal to any contemporary work of the class. The restoration and enlargement of the buildings on St. Michael's Mount were carried out by him. Since Mr. ST. AUBYN took up his residence in Marazion, he busied himself with local government, and he filled several honorary offices. He was an excellent type of the provincial architect.

ON Tuesday there was a meeting of the museum building committee of the Cardiff Corporation, when the subject of appointing an architect was considered. It will be remembered that some controversy arose on the subject. Mr. EDWIN SEWARD, of Cardiff, was consulted by the committee, but the architects of the town and district were eager to have an open competition. A memorial from the Cardiff, South Wales and Monmouthshire Architects' Society was read on Tuesday, in which it was suggested that unless they had already pledged themselves to any architect, the committee should invite public competition for the business of the museum buildings proposed to be erected in Park Place, the competition to be under rules of the Royal Institute of British Architects. A letter from Mr. EDWIN SEWARD was also read, in which he asked the committee to take into consideration some facts relating to his connection with the project. In the designs he made in competition fifteen years ago, the museum, and especially the art gallery of Cardiff, had their origin, but with the disadvantage that the conditions relating to cost and space could not be adequately represented. When, after ten years, extensions were resolved on, he asked for the opportunity of preparing designs which might at length do better justice to the

institutions concerned. Such plans as then appeared suitable were produced in consultation with the committees and the officials. In respect to the museum and art gallery, the best attempts made appeared to give clear indication of the undesirability of continuing that institution in an extended storey above the library building. A change in the constitution of the museum's financial resources allowed it to be detached from the library. More than three years had thus elapsed before a tangible issue was obtained, during which he followed up and defined the various changes of idea and intention as they arose. Finally, he redrew and revised the plans and details previously brought to a complete stage, also preparing new bills of quantities for erecting the present library building. To that building he had gladly devoted attention of a kind in which neither time nor cost to himself were considered, as his share towards assuring for it a useful and interesting place among the libraries of the kingdom and the public buildings of Cardiff. In reference to the Museum, he was prepared to carry it forward whenever the Corporation might again be ready. He had also visited the leading art galleries and museums of England, and those of Rome, Florence, Naples, Antwerp, &c. He hoped that the change of policy as affecting the museum site did not carry with it a change of policy in respect to the architect. The Mayor proposed that Mr. SEWARD be retained as architect to the committee for the new building. He said he had had considerable experience of Mr. SEWARD's work, and if there was no legal claim upon the committee to appoint him there was a moral claim which ought to guide them. He wished, as Mayor of Cardiff, to give proper effect to this motion, to have the proposal of it. The motion was cordially supported, one of the committee saying that Mr. SEWARD was well acquainted with the class of work, having taken a very deep interest in all matters connected with museums and art galleries. The committee would have as good work done by him as by any architect whom they might appoint. The resolution was carried unanimously subject to the confirmation of the Corporation. It was also resolved that the memorialists be informed that the committee felt itself morally pledged to retain Mr. SEWARD as its architect. "All's well that ends well," and it is to be hoped there will be no longer any friction between the successful and the unsuccessful aspirants for the work. The sum available for the museum is 12,000*l*.

AN action brought by Mr. ROBB, a Belfast merchant, against Mr. J. J. FARRELL, architect, Dublin, was settled in the Rolls Court on Tuesday. The plaintiff sought for an injunction and for damages in respect of interference with his rights of light by the erection of a new Empire Theatre of Varieties in Belfast, of which the defendant was architect, and at the time owner. The terms of the arrangement were that the action should be stayed on the defendant paying to the plaintiff 900*l*., each party abiding their own costs; the settlement to be without prejudice to further proceedings should there be any future interference with the plaintiff's rights.

SEVERAL French artists have been admitted to the Legion of Honour or advanced to a higher rank in it, ostensibly for upholding the reputation of their country in the exhibitions of Lyons, Antwerp and St. Petersburg. M. BESNARD and M. MAIGNAN, the painters, have become officers. Joined with them is another painter, M. POILPOT, whose numerous panoramas have gained fame elsewhere than in France. M. LANSON, the sculptor, and M. JACQUET, the engraver of medals, are also officers. To the Chevaliers the following painters have been added, viz. MM. BARAU, BARILLOT, BEAUVERIE, DAUPHIN, MARAIS, JEAN MONCHABLON, MUENIER, NOZAL, PÂRIS, RENAN, RENARD, SAIN, VAUTHIER. The sculptors are MM. BARTHOLOMÉ, ISIDORE BONHEUR, SUCHETET. The architects are MM. DEGLANE, VAUDOYER. In addition are MM. DESBOUTIN, LALAUZE, engravers; M. DIOMÈDE, a sculptor on precious metals; M. GRANDHOMME, painter on enamel; MM. GRASSET and LIBERT, painters and designers; and M. MARIOTON, an operative sculptor.

PAINTING AT THE ROYAL ACADEMY.—II.

THE most remarkable work in Gallery V. is *The Drummers*, by Professor VAN DER OUDERAA, of Antwerp. It represents a street in a Flemish town when some State procession took place, probably in the time of the Spanish domination. The drummers are clad in a creamy white uniform with scarlet stripes, and they carry old-fashioned and cumbrous instruments. They are mostly young men who are not apparently proud of their office, but the leader evidently considers himself to be at least equal to the marshal of the ceremony. The scheme of colour is novel, the figures are excellent and subtly characterised, and the scene is a sort of old-world revelation. Near it is a vivid portrait of *Mrs. Sidney Dicksee*, by Mr. T. F. DICKSEE, which in execution is superior to some of those which have gained more admiration. M. ALBERT NEUHUYS'S *Dutch Interior* would, without the catalogue, be ascribed to M. ISRAELS, and it will sustain comparison with one of that master's works. The *Isles of the Sirens*, by Mr. J. BRETT, differs not merely in title from preceding seascapes. The sea is more suggestive of a flowing motion, the craft appear to move, and there is a less expanse of stippled work. The artist's other pictures are proofs that he has at last accepted advice, and is not restricting his undoubted ability to one class of subject. His "new departures" are most promising, and Mr. BRETT deserves to be encouraged. Mr. RALPH HEDLEY'S *Old Pension Day* is pathetic, and the artist has contrived to express a scene of military life without the aid of regimentals, with the exception of an orderly clerk. There is no exaggeration, for even the paymaster appears sympathetic. *The Smithy*, by Mr. STANHOPE FORBES, is equal to his *Forge*. Often as the subject was painted, we doubt if ever the characteristics were better rendered. In this case we see not only labour which has to be expeditious, but that peculiar listlessness which it seems to provoke as a sort of compensation. It is a pity the picture cannot be hung beside the *Reverie* in the first room, in order to suggest the difference between illumination that is made an auxiliary, as it should be, to form, and illumination that is created for an occasion and is not worth the trouble of preparing, much less of representing. Mr. DAVID MURRAY has two of his four landscapes in this room, *In Summer Time* and *Kennet and Avon*. Like his other works they do not appear to be composed, but rather as transcripts from nature, and accordingly they are among the pictures which are worth looking at a second time. Mr. SYDNEY P. HALL is better known from his works in black and white than in colour. His *Vivâ Voce Examination in the Old Schools, Oxford*, is excellent from the way in which the uncertainty of the student's answers is suggested. The youngest examiner, as befits one who has lately gone through the ordeal, is arrogant with the assurance of knowledge. Next to him is an older man, who cannot make out the mumbled replies, while the remaining examiners are somewhat puzzled. The concealed wringing of the student's hands reveals the strain he is undergoing. The lighting of the picture is one of its best qualities, and although colour has to be absent from so academic a scene, there is no lack of relief.

Every visitor who proposes to make a round of the rooms would do well to glance on passing the turnstile at Mr. H. HERKOMER'S *The Burgomaster of Landsberg, Bavaria, with his Town Council*, which, with the aid of the lines offered by the central hall and the vestibule, produces a sort of effect like that of a panorama. That may not be entirely legitimate, but from such a point of view alone is the picture satisfactory. Anywhere else the devoting of over a hundred and fifty square feet of the limited wall space of Gallery VI. to a collection of nobodies, who are penned in enclosures which are too small to contain them, would be a surprise; but, as everybody knows, the Academy walls belong to the members, and it is only on sufferance that works by outsiders are tolerated. The picture may be truly described as sensational, but the worshipful councillors are vigorously painted, and the glimpse of the town through the windows is pleasing. Over it is another big picture of a different character, *Crossing the Red Sea: Pharaoh pursuing the Israelites*, by the American painter, Mr. F. A. BRIDGMAN, which apparently is a decorative work, and, we suppose, for a position

where subdued colour is necessary. In that respect it differs from the painter's smaller works, which have all the colour demanded by Eastern scenes. The composition is dramatic. The Israelites are not visible, but the figures of the Egyptians suggest that no insignificant enemies are before them. They have the care in the modelling which was to be expected from one of M. GÉRÔME'S pupils. It is not often pasture is employed so near the coast as appears in Mr. P. R. MORRIS'S *Storm on Albion's Coast*, but, assuming that condition, the picture is most impressive, and the inability of the sheep to combat with waves and winds without the care of the shepherd and his dog is manifest, and gives a character to the scene which, without the figures, would be absent.

Mr. J. W. NORTH has forsaken the manner which was exemplified in his water-colour drawings. *Fruition: England* in Gallery VII. shows fruit trees instead of tangled hedges, and the mass of leafage and blossom makes the title appropriate. A *Bayswater 'Bus* may appear a commonplace subject, but Mr. G. W. JOY has introduced four or five figures that are comely, but they suffer from the proximity of the hideous advertisements. There is no effort to make remarkable contrasts, which is generally the drawback in similar scenes.

There are a few good pictures in Gallery VIII. If *Suscipe me, Domine*, is not exaggerated, the reception of a nun is a survival of Mediævalism that has little changed. The dramatic action of the novice possibly does not follow the rubric any more than the architecture corresponds with an existing building, but with less emotional display the sacrifice would not be so manifest. The figures of ecclesiastics, servitors and the nun's relatives are characteristic. No wonder the scene is fascinating to young ladies, for it is more brilliant than a fashionable wedding. The variations which religious influences exhibit is suggested by the neighbouring picture, the *Youth of Ulysses*, by Mr. H. J. DRAPER. It shows the Ithacan prince lying on the ground in the presence of the azure-eyed goddess who bears the spear with which she levelled ranks of heroes. The boy is no doubt enjoying his visions of future victories. It is hardly a paintable subject, for what painter could realise HOMER'S description? A scene like *Sanctuary*, by Mr. H. G. RIVIERE, where the goddess appears not as a vision but as a statue in a temple to which some Greeks have fled, shows a more accurate notion of the boundaries of poetry and painting. Mr. G. E. ROBERTSON'S *Mark Antony's Oration over the Body of Caesar* is not a reproduction of a scene on the stage. He has selected the moment when ANTONY has descended from the "pulpit," and has consequently sacrificed effect in order to express the triumph of the orator in moving the populace to mutiny. Although Mr. COLLIER has still his weakness for toxicology (on canvas), his *Death of Albine* presents as pure and gentle a girl as could be imagined. The simplicity of the work denotes a development of the artist's imagination, which should enable him to create much better work than is to be derived from the byways of history. The *Joan of Arc*, by Mr. G. W. JOY, in which the heroine is seen in armour, lying on straw, is a fitting comparison to it. Mr. FRANK BRANGWYN'S *Rest* might be a *Flight into Egypt*, only the figures are not conventional in the sense of imitating Italian masters. They are not beautiful or refined beings, and the work will, by most people, be taken as a pictorial freak; but it cannot be passed by, and when once seen cannot be forgotten.

Gallery IX. rarely receives much attention from the crowd. As the President has two of his works in it, and as it contains Mr. Gow's and Mr. Woods's diploma works, besides contributions from other Academicians and Associates, it may thus escape neglect. As a collection of cabinet works, it offers a means of enjoyment less obtrusive than the collections in other rooms, but no less genuine.

Gallery X. too often appears like a refuge for pictures whose acceptance was at one time doubtful. This year it contains one of Mr. SOLOMON'S mythological efforts, *Echo and Narcissus*. There is nothing statuesque about the picture; the love-lorn nymph is a modern beauty and the hunter is a fool whose admiration of himself is ridiculous. M. VAN DER OUDERAA'S *Jewel Cloister* is elaborated like some modern Belgian works, which in that respect appear to be survivals of the earlier Flemish manner. Mr.

MURRAY'S *Thistledown* shows a plain partly in bloom and partly with open spots, where sheep are collected, with low hills towards the horizon. There is another treatment of the subject seen in Mr. SCHOFIELD'S picture. Mr. BULFIELD'S *The Last Hour* is a deathbed scene, with a Catholic priest giving communion to the dying man. It shows not only skill in painting a humble interior dimly lighted, but a reverential spirit, without which the subject would become degraded.

The two best pictures in Gallery XI. are opposed. Mr. ERNEST NORMAND'S very large *Bondage* has some claim to be considered the picture of the year. There is no unusual imagination in it, for it simply represents a display of fair and dusky captive girls by a slave-dealer before an Egyptian king, and it is not inspiring. But those characteristics are general this year, for it is only the landscape which can excite an emotion. What other painters have attempted on a small scale Mr. NORMAND offers in quantity, and he has painted his nude forms in a manner which makes them pre-eminent. Such a scene could hardly be observed in the time of the PHARAOHS, but at a later period there was more likelihood. The artist wished to paint a showy and grandiose subject which would allow him to display varied abilities, and the public have reason to be thankful. Heavy as was the task assumed, there is no sign that Mr. NORMAND was not equal to it, for the picture appears to have been painted with ease. Opposite is Mr. CATON WOODVILLE'S *Charge of the Light Brigade*. Factitious legends have brought that event into disrepute, and, moreover, it must always be painful to remember that brave men were sacrificed by the incompetence of a mountebank like Lord CARDIGAN and a lunatic like Lord LUCAN. A painter must be courageous who revives the subject. The appearance of Lord CARDIGAN must always bring doubt on a picture, and he might well have been omitted, for his regiment, the unlucky 11th Hussars, is only represented by himself. The enemy is not seen, but their power is apparent by the falling of men and horses. By restricting himself to a limited number of troopers the artist is able to impart individuality to them, and more interest can therefore be taken in this work than in the majority of battle-pieces. Mr. WOODVILLE'S skill in representing men and horses in action was demonstrated several years ago, but in none of his works is there so consistent a scheme of colour as we see in this year's picture. Lady BUTLER, in *Dawn at Waterloo*, has painted "the *réveille* in the bivouac of the Scots Greys on the morning of the battle." On such an occasion discipline is tested, for even the damp ground as a bed can have its attraction. Officers and men are scattered over the ground allotted to them, and there is a good deal of variety seen in the reception of the summons. The incident is clearly portrayed, and the picture will make a popular plate.

It cannot be said that the Academy is neglectful of water-colour art this year, for there are about two hundred and thirty drawings. Among them are many excellent landscapes and figure-pieces. This part of the exhibition is too much neglected. There are, too, about a hundred and fifty miniatures, thus showing that, in spite of photography, there are patrons for an old-fashioned form of art. The Black and White Room contains examples of engraving and some admirable portrait drawings.

SCULPTURE AT THE ROYAL ACADEMY.

IN this year's Exhibition Mr. HAMO THORNYCROFT dominates among the sculptors. By a sort of inevitable law every sculptor in this country is expected to be a portraitist, and Mr. THORNYCROFT is usually successful with work of that class. His full-length statue, *The late Earl Granville, K.G.*, appears to represent the Minister as listening to some argument or attack which it was his business to turn aside by one of his genial replies. His lordship appears in evening dress and wears the broad ribbon of the Garter, as well as a tie which, if in white, was modelled on the familiar blue one which the Earl preferred to all others. The difficulty of making a presentable figure offered by such a costume, which above most others recalls SHAKESPEARE'S "forked radish" as a definition of man, is in part overcome by placing a little pedestal at one side, on

the top of which sheets of paper rest, Lord GRANVILLE having one hand on them, and which also supports a piece of drapery that is brought to the ground. The other hand contains a document. The figure stands alert, and expresses a reserve of energy and good-humour with a becoming sense of responsibility. Lord GRANVILLE'S face was almost as difficult to treat as JOHN BRIGHT'S; it was not heroic, and years spent in leading forlorn hopes in the House of Lords only augmented the kindness of the expression. That Mr. THORNYCROFT has been able to produce so agreeable a figure with such material is almost as strong testimony to his powers as his statue of *Gordon*. The two busts, *Sir George Williams* and *James Chance, Esq.*, are also well characterised.

There cannot be much variety in recumbent statues, especially when they represent figures lying on their backs and clad in the rochets which, as a specialty of English robemakers, do not fall in as graceful folds as Greek drapery. The Italian artists of the Renaissance were not fettered in that way. There was not only a choice of robes and vestments in which the subjects could appear, but it was allowable to represent the prelates in a variety of ways. A bishop might lie on his back or on his side, he might appear as giving a final charge to his clergy, or be attentively listening to his confessor's discourse. As a consequence the episcopal monuments are of numerous types, and it is easy to recall a great many of them. But of late years recumbent figures of bishops have grown so common and they are so much alike it is not easy to discriminate between them. The division into bishops with wigs and bishops without wigs used to serve, but it is now no longer applicable. Mr. THORNYCROFT, in his *Right Rev. Harvey Goodwin, Bishop of Carlisle*, has adopted the Italian precedent of introducing a couple of amorini to support the bishop's head, and he places a mitre at his feet. So much unreality lowers the solemnity of a monument. We must suppose the sculptor has had a mask to work from, but Dr. GOODWIN must of late years have acquired a pugnacious expression which was not his when he left Cambridge.

The plaster model of a dancing-girl, *The Joy of Life*, is Mr. THORNYCROFT'S most remarkable work. In it we see rebellion against ancient precedents as well as CANOVA'S masterpiece. The dancer is not reposing, or if so it is for a moment the duration of which is not to be measured. Standing on the toes of one foot, the other leg is raised and about to fall into a new position. The muscular action could hardly be more definite if represented by a cast. One arm holds lightly the edge of the skirt; the other is stretched out to aid the equilibrium. The head is bent, with the eyes cast down, which indicates that the girl is either a novice or attempting a new *pas*. The drapery is not that adopted on the stage or seen in rehearsals. There are, in fact, two skirts, which give a very great variety of folds, offering contrasts in the lines. It is a daring experiment, and the sculptor has succeeded in what he aimed at.

In art there cannot be canons, unless by a tacit agreement among those who practise and those who judge concerning their principles. The history of sculpture reveals that progress was accompanied by a recognition of the restrictions offered by materials. Attached drapery of metal or textile fabrics was abandoned, so was colouring. The rigidity of stone and marble was accepted as prescribing repose. But that did not signify an inanimate appearance. As FALCONET, the French sculptor in the last century said, "Sculpture should not be satisfied with a cold resemblance, and such as man presented before he was animated with the breath of life. That sort of exactitude, however well rendered, can only excite praise that is no less chilling. What the sculptor should express in marble, bronze and stone is nature that is alive and passionate." The last words might be supposed to encourage the production of figures apparently in motion, but FALCONET was not ambitious to see the painter's territory invaded. His contemporary REYNOLDS, who was no less catholic in his taste, also entered a protest against "the folly of attempting to make stone sport and flutter in the air," which carried with it its own reprehension, and which was one of the consequences of an effort to suggest movement. There are, however, signs enough that the rules which were accepted in a past age are no longer held to be binding. Mr. THORNYCROFT may say that in his

Diana and other classic figures he has duly respected precedents; why should he not endeavour to enlarge the sphere of his art? *The Foy of Life* is modern from head to toes. It is as phenomenal as ZOLA'S *Joie de Vivre*, and if one production has attained success why should not the other?

The principal work of Mr. THOMAS BROCK is his full-sized model of the statue of the late Sir RICHARD OWEN, which is to be placed in the Natural History Museum. The naturalist's discoveries are now supposed to be out of fashion, but he was instrumental in forming that museum, and although OWEN was hampered in his conclusions by a respect for orthodoxy, he was the legitimate successor of CUVIER. His head was admirably adapted for a sculptor's use, for there was no flabbiness in any part. Mr. BROCK'S success in catching a likeness is, therefore, not surprising. OWEN wears an academic gown which imparts dignity to the figure. He is represented standing, and as using a bone as a subject for his lecture. That, like CUVIER, he could construct a skeleton out of a single bone or a fragment of one is a historic fact, but as the most important of his deductions related to the spine and its development, it would have been preferable to have suggested in some way the foundation of his reputation. The committee are, we suppose, responsible for the selection rather than the sculptor.

Mr. ONSLOW FORD is at his best when working in bronze, and his heads, *W. Q. Orchardson, R.A.*, and *Briton Rivière, R.A.*, are emphatic likenesses. Another vigorous bust is Mr. ARMSTEAD'S *Augustus Mordan, Esq.* It is an advantage sometimes to have a different form of portraiture, and Mr. FRAMPTON'S *Mother and Child*, apparently a portrait group in high relief, has therefore much to recommend it, although the mother is only a bust while the child is full length. His *Music and Dancing*, two panels in low relief for a cabinet, are interesting examples of decoration which should have an influence on the furniture market. Mr. POMEROY has a sketch medal of a long frieze for the Sheffield Town Hall, which is representative of *Labour*. He has adopted the plan of avoiding gaps between the numerous figures, and the effect will be very rich and animated. But to execute the work properly will therefore be costly, and we trust the authorities will not be niggardly or endeavour to alter the character of the work for the sake of some small saving. There is "go" enough about Mr. SWAN'S *Orpheus*, but it may be doubted whether a Greek who ought to know something of the subject would agree that so much impetus and strain of the whole body were necessary in order to make the lyre express sweet sounds. Sculpture has not yet gained a hold on the public, and it is most creditable to the artists that this year's display is so satisfactory. Ability exists, patronage alone is needed, and with its aid, *pace* M. ROCHEFORT, England might yet surpass his countrymen in sculpture as, according to his acknowledgment, they have done in painting.

DURHAM CATHEDRAL.

A SPECIAL meeting of the Durham and Northumberland Archæological Society has been held to examine the discoveries in Durham Cathedral. The members assembled in the nave, when a short address was given by the president, the Rev. Dr. Greenwell, on the history of the building of the cathedral. He said there were few buildings in England where they had so many ascertained dates to go upon. To every part of the building they could fix a precise date. Durham, he said, was quite a late place compared with some of the ancient cities of England, such as Chester and Lincoln, which were in existence in Roman times. Discoveries they had made pointed to a Roman occupation at Durham, but it was only of a trifling character, and not a great settlement like those of Lanchester and Chester-le-Street. Proceeding, Dr. Greenwell told of the origin of the church at Durham. It had, he said, its origin at Lindisfarne, and without Lindisfarne there would have been no Durham. Driven from Lindisfarne by the invasion of the Northmen, the pious monks came to Chester-le-Street, and after an interval of wandering to Durham, Aldhun commenced to build his church at once, and in 899 finished it. He fancied Aldhun's church would occupy the site of the present nave of the cathedral, and he had no doubt but that careful excavation would reveal the whole of the ground plan of the original church built by Aldhun. The Bishop of Durham after the Conquest was Walcher, who reigned from 1071 to 1080, and afterwards

in 1081 they had the great Bishop William, or St. Carileph, who established the Benedictine monastery at Durham. At first Aldhun's church was used for the purposes of the monastery, but in 1093 he determined to build a new church of larger dimensions and one worthy of the great monastic house he had established. On August 11, 1093, the foundation-stones were laid, and although there were differences of opinion as to how far the building of the church had proceeded when Carileph died, he was of opinion that Carileph practically finished the whole of the church up to the first sub-bays of the nave, with the exception of the south transept and the roof of the north transept. These were done by the monks in the interval between Carileph and Flambard. The latter bishop finished the nave up to the groining, so that in 1128 they had the whole of the church completed with the exception of the roof of the nave. It had been questioned whether the stone-groined roof of the nave was of that early period, but he himself saw no difficulty in the matter, and the stone-groined roof erected in the early part of the twelfth century, and the first of its kind in England, was only in consonance with the general splendour of the building. Durham Cathedral was a building of great magnitude; it was a building showing wonderful skill—architectural and engineering skill. There was no Norman architecture to be mentioned alongside it; all others paled beside it. Continuing, Dr. Greenwell spoke of Bishop Pudsey as a great builder. He built the Galilee Chapel, which was a beautiful specimen of Transitional work. Afterwards the speaker dealt with the building of the Nine Altars by Bishop Farnham, this superseding the apsidal east end built by Carileph, which was said to be in a ruinous condition. The introduction of the Nevill screen followed and the building of the bishop's throne, the latter in the time of Bishop Hatfield. There was, he said, no such throne anywhere in England, and that was due to the fact that it was a palatinate and not an episcopal throne. Having spoken of the cloisters and the building of the monastery kitchen and other parts of the monastery, Dr. Greenwell brought an interesting address to a close.

In the afternoon the members again assembled in the nave of the cathedral, when Mr. C. C. Hodges, of Hexham, delivered an address upon the architectural features of the church. Afterwards the members examined the recent discoveries at the east end of the cathedral, through which Carileph's apsidal east end has been disclosed. This concluded, a visit was paid to the newly-restored chapter-house, the work having been carried out as a memorial to the late Bishop Lightfoot.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

THE Royal Society of British Artists has given effect to a resolution adopted last year, to so increase the number of members as to enable the Society permanently to hold one exhibition annually of the works of members only. The announcement was made last season, with the result that 117 artists sent in their names as candidates. At a general assembly held on the 6th inst., the following were elected:—John Aborn, J. Noble Barlow, Francis Black, Arnesby Brown, Leicester Burroughs, Charles Collins, C. H. Eastlake, Walter Fowler, Windsor Fry, E. Gouldsmith, Robert Hume, T. Ireland, Burrough Johnson, J. E. Jacobs, S. M. Laurence, W. Luker, jun., Fred Milner, T. E. Mostyn, Greville Morris, J. W. Parsons, Graham Robertson, Harry Stannard, J. Sanderson Wells and W. Tatton Winter. The Society will hold another election in the autumn.

THE PARIS EXHIBITION OF 1900.

THE Paris correspondent of the *Times* writes:—"The plan of the exhibition of 1900 will be considered in a few days by the Supreme Commission, and will be submitted to Parliament at the beginning of July. The cost is estimated at 60,000,000 francs. The grand entrance will be at the Place de la Concorde, but the Champs Elysées gateway will be at the extremity of a broad avenue lined with statues and colonnades and leading to the new Invalides Bridge over the Seine. To the right of this avenue will be the marble Palace of Fine Arts, which is to supersede the Palace of Industry, and will be a permanent structure. To the left will be a smaller permanent building devoted to the art of the past. The French textile exhibits will occupy the Invalides esplanade, while along the river on both banks between the Invalides and the Alma bridges will be a series of buildings for foreign exhibits, the congresses, flower shows, &c. The army and navy exhibits will be a little lower down on the south side. The food, transport, mechanical and chemical sections will occupy the Avenue de Suffren side of the Champ de Mars, while on the Avenue de la Bourdonnais side will be the literary, scientific, artistic, dress, mining and metal sections. The electricity building will

connect these two wings, while the centre of the Champ de Mars will be devoted to fountains and flower beds. The festival hall, with agricultural exhibits on each side, will be behind the electricity building and in the centre of the machinery building. Colonial industries, products and dwellings, with their inhabitants, will occupy the Trocadéro Gardens. Altogether, without any attempt to vie with Chicago in area, the exhibition will be sufficiently different from its predecessors to present the charm of novelty."

CRYSTAL PALACE AWARDS.

THE following medals for paintings exhibited at the Crystal Palace have been awarded by the judges, Messrs. J. B. Burgess, R.A., Phil Morris, A.R.A., and Alfred East:—*History or Figure Subjects*.—A Night School, Edgar Bundy (gold medal); "1793," the Eve of the Noyades, T. Blake Wirgman; A Ploughing Match, W. B. Fortescue; A Legend of Provence, Miss J. L. Gloag; Marooned, Percy R. Craft. *Landscapes, Sea-Pieces, Animals, and other Subjects*.—Many Waters cannot Quench Love, J. Walter West (gold medal); The Music of the Eager Pack, John Charlton; The Golden Duono, Pisa, Wyke Bayliss; Under the Lindens, George C. Baité; Gélert, W. Frank Calderon. *Water-Colour Drawings, irrespective of Subject*.—Recruiting for Savonarola, F. W. W. Topham (gold medal); Evening Mists—Derbyshire, Harry Stannard, jun.; Mumbles Lifeboat Rescuing Crew, Edwin Hayes; The Falconer—a Good Day's Sport, John Scott; A Corner of the Studio, C. A. Smith. *Works by Foreign Artists*.—*History or Figure Subjects in Oil*.—The Christening, O. Daupheimer, gold medal; Charge of Cuirassiers, C. Bomblé (silver medal); What is pleasure to one is sorrow to another, J. Kleinschmidt (silver medal); A Turkish Sweet-seller, Simon Sabides (silver medal); Evasion, Alfred Paris (silver medal). *Landscapes, Sea-Pieces, Animals, and other Subjects*.—In the Forest (Autumn), Professor C. Kröner (gold medal); A Village Street in Bavaria, Otto Ahrweiler (silver medal); The Shepherd, E. Meissner (silver medal); Market-place in Capri, Ferd. Brüll (silver medal); Indian Village in South Africa, Will Kuhmert (silver medal).

ARCHITECT'S FEES.

IN the Hull County Court Mr. George Thorpe, architect and surveyor, of Hull, sued Thomas Leeson, builder, of Hull, for 21*l.* 10*s.*, charges for preparing plans and bills of quantities in connection with a building. The case for the plaintiff was that in the early part of 1894 he was asked to prepare plans for land about to be purchased by the defendant. The defendant provided the plaintiff with a draft outline of what he required. Ultimately a sketch plan was prepared by the plaintiff, and the defendant was informed that the cost of the building would amount to about 400*l.* The defendant was advised before entering into a contract for the purchase of the land to have plans prepared and submitted to the works committee of the Hull Corporation. This was agreed to, and the plaintiff was instructed to prepare and submit the plans, which were subsequently approved by the Corporation. Whilst negotiations were going on the plaintiff was instructed to prepare drawings and specifications, and also asked what his estimate of the cost would be. It was agreed that the terms should be 5 per cent. on the outlay should the work proceed. From time to time, however, these plans were added to, which materially increased the cost of the proposed building. When the specifications were shown to one or two builders in Hull, with a view to tendering, it was found that the estimate was too low, and that they would require bills of quantities. On this point the action was to be fought. The agreement was that 1 per cent. on the lowest tender should be paid if the job did not come off in reference to the bills of quantities, and plaintiff had only claimed 2½ per cent. on the proposed outlay, which was very reasonable. The plaintiff was entitled to a fair remuneration for services rendered. The defendant had paid something into Court, showing that he was liable for something.

The plaintiff, being called, denied in cross-examination that it was in consequence of his estimate being so much below the tenders that the bills of quantities were required. He was certainly instructed to prepare the bills of quantities.

For the defence it was contended that the amount paid into Court, 10*l.* 10*s.*, was sufficient to meet all the claims of the plaintiff, viz. 2½ per cent. on the first estimate of 450*l.*, and that he was not entitled to the remainder of the claim, because it was in consequence of his estimate that bills of quantities were required, and that they ought not to be paid by the defendant at all.

His Honour gave a verdict for the plaintiff for 15*l.* 10*s.* including the amount paid into court, and costs.

TESSERÆ.

Early Italian Art.

STYLE and subject are sometimes confounded with each other by writers, and in ordinary conversation nothing is more common than this mistake. In regarding early Italian art, it is of great consequence that we consider its distance from nature not as a departure from her, but as the nearest approach the painters could make to her; a distance they laboured to shorten, and which was gradually shortened with a remarkable steadiness of advance to its consummation in the hands of Michel Angelo and Raphael. It seems to be a great mistake to ascribe so much as is ascribed in the peculiarities of the styles of the Mediæval painters to religious feeling. That they were generally influenced by sincere devotion to the degree attributed to them cannot for a moment be doubted; but the general character of their imitation is the same as that of Chinese art, and is evidently a style, if such it may be called, which must chiefly mark immaturity everywhere and under all circumstances. In the infant art of every country the accidental appearances of nature are omitted, not so much, perhaps, from their being unperceived as from a notion that they would interfere, and when imperfectly given they do interfere, with beauty and expression, both of which have always been the first objects of all serious art. The Chinese, for instance, though much of their ornamental painting belongs to the grotesque, yet in their representations of real life aim to the utmost at beauty, grace and expression. Those enthusiastic admirers of Mediæval art who may think there is something almost sacrilegious in comparing anything by Chinese hands for an instant with it, should know that Flaxman, than whom no man ever more fully appreciated early Italian art, and who, indeed, was the first among the moderns to direct attention to it, saw how much, apart from subject, Chinese painting had in common with it. Chinese pictures could be seen on the walls of his parlour which he admired as well for their grace and simplicity as for the beauty of their colour.

Translucent Enamels on Bas-Relief.

The enamels in *taille d'épargne*, executed for the most part upon a common metal, were rarely the work of great artists; they may be considered, in fact, as trade articles. The Byzantine enamels, on the other hand, belonged to the highest class of goldsmith's work; they were executed upon gold, and were employed for the most sumptuous and costly decorations of churches and palaces. These enamels did not, however, suit the taste of Europe, and especially of Italy, then developing its grand schools of art, and accordingly the style was varied. Instead of forming a number of cells upon the face of a piece of copper, and then filling each of these with a different coloured enamel, the design was chiselled in very feeble relief upon the plate, usually of silver; variously coloured enamel powders were then placed upon it, and the plate heated until they melted and formed a translucent coating of glass over the whole surface, no metallic lines being exposed; the design, being formed by the work beneath, was seen through the transparent enamel. The works of this class are often remarkable for the perfection and variety of colours, the gradations of shades being beautifully produced by different thicknesses of the enamels. Where the relief was highest the enamel of course was thinnest, and consequently the shade of colour lightest; where the metal was chiselled out the enamel was thickest and the colour deepest, the effect being exactly similar to that produced by those pretty coloured porcelain lithophanes which are made in Germany, and of which so many examples were once popular. The scope which this system of enamelling gave to the genius of the artist (for, as Vasari says, "E specie di pittura mescolata con la scultura," a species of painting associated with sculpture) brought it into great favour in Italy from the end of the thirteenth to the beginning of the fifteenth century. From Giovanni Pisani, who executed a high altar for the church of Arezzo, partially decorated in this style in the year 1286, to Benvenuto Cellini, who made some modifications in the processes, it was employed by all the great artists of Italy who occupied themselves with the precious metals, such as Pollajuolo, Francia, &c. A precise description is given of it by Vasari. When the style of enamels in relief was in vogue artists sometimes varied the effect by combining several styles. One of the happiest of these combinations was to produce a silhouette in *taille d'épargne* upon a plate of gold, or more frequently upon silver; the part of the plate tooled out had then some ornaments chiselled upon it in very feeble relief, over which was laid a coating of translucent azure enamel. The folds of the drapery, and the face, hair, &c., were expressed by the graver upon the silhouette in metal, the incised lines being afterwards filled up with a black niello enamel—this was, therefore, a combination of the styles of *taille d'épargne*, niello, and translucent enamel on bas-relief. Another style was practised at an earlier period (thirteenth century) which was a combination of the *taille d'épargne* and of the embedded in filigree style. There was also a peculiar

kind of enamelled work produced in the sixteenth century which belongs to the style in bas-relief, and deserves to be mentioned; it consisted in figures in relief in gold or silver upon an enamelled ground. It is still practised in Russia.

The Pyramids.

What is the meaning of the word pyramid—does it explain the subject? Are the pyramids peculiar to Egypt or do other countries afford analogies? Is there any traditional or recorded event which may be supposed to have led to their erection? With regard to the first, the etymology of the Greeks, whose vanity led them to make every possible adoption to their own language, appears to be the one most commonly received. The pyramids are not peculiar to Egypt, but are to be found in all the earliest postdiluvian researches; and, indeed, have been continued amongst those nations secluded from a general intercourse with other people. The pagoda of China is but a modification of the pyramid, rising storey above storey, and decreasing towards its point; the pyramidal temples of Hindustan present a nearer resemblance, and the pyramids of the Mexican empire, those of Copolula, Papanita and Teotiuachao, present a striking analogy. These last, the pyramids of Teotiuachao, which are placed on due cardinal points, are situated in the valley of Mexico, about eight leagues north-east of the capital; two are of considerable size, that of the Sun being 682 feet at the base, rather less than the second (that of the Moon), and 180 feet in height. They are approached through long avenues of small pyramids placed in exact lines north to south and east to west, and occupy a place called Micoath, *i.e.* road of the dead; they are said to have served as places of sepulture for the chiefs—the like tombs occur round the base of Cheops. Thus have we the Egyptians, Chinese, Hindus and Mexicans, all people of the highest antiquity, all famed for the cultivation of astronomy and the recording of events, each possessing pyramids whose history is enveloped in mystery, but each possessing ends in common—religion, record, sepulture. Touching the third query, is there any circumstance that could have led to this occurrence of idea, their character is too arbitrary and their resemblance too uniform to have been the result of chance. The earliest settlement of the postdiluvian inhabitants was marked by the erection of a high place, which all commentators agree to have been of the pyramidal form. "Go to! let us build us a city, and a tower whose top shall reach to heaven, and let us make for ourselves a name." Engaged on this work they were dispersed over the face of the earth, carrying with them the recollection of their employment, migrating under the sons of the patriarch, and, as their numbers increased, heightening their pride and causing them to forget their Divine protection, the sons of Shem, in their earliest settlements in the east, erected monuments which recorded their arrival or marked their dispersion. The sons of Japhet, prompted by similar feelings, and bearing in recollection the same events, followed the like example in the west; while the sons of Ham, under Mizraim, the founder of the Egyptian empire—famed for the earliest time for their wisdom, profuse of labour and lavish of expense, with conceptions formed in mystery and heightened by their religion, taking magnitude and durability for their models—exceeded their brethren; and while the proud city of the Pharaohs, of which these piles once formed the greatest wonder, has melted away, leaving not a trace behind, the pyramids, renowned for their antiquity and magnitude, became consecrated to the worship of the gods and to the cultivation of their most cherished study—astronomy. Hallowed by these sacred purposes, they were in after times used as the depositories of the illustrious dead.

Equilibrium of Arches.

It is to be observed that in most of, if not in all, their bridges, the ancients did not increase the dimensions of their voussoirs from the crown towards the springing or coussinet, but made them of an equal thickness throughout; in this they were followed by Palladio and all the Italian architects. They sometimes, however, made the alternate voussoirs larger than the others, as Labelye has done in old Westminster Bridge. While the voussoirs are considered as indefinitely short and are held in a state of tottering equilibrium by the vertical pressure of the superincumbent loading alone, as the theory in its simple state requires, the arch would not be calculated to support any extraneous weight. In practice the voussoirs are of considerable length, and their adjacent surfaces are in contact; and when an additional weight is brought to act upon any part, suppose at the crown, it will cause the joints at such part to open on the concave side; the haunches will consequently be forced up and their joints will open on the convex sides; but while the imaginary lines, expressing the directions of pressure passing through the voussoirs, are not so much distorted as to be thrown out of the limits of the surfaces of the blocks, the arch will stand, though loaded at the crown with a certain degree of weight beyond what the strictness of the theory allows; when these imaginary lines are removed out of

the limits of the adjacent blocks or voussoirs, the arch will be completely destroyed. It therefore follows that the voussoirs should be as large as may conveniently be got; the larger they are the more may the distortion be increased without endangering the structure, since the directions of their pressures will be less likely to exceed the limits of their magnitude. In general, while a line can be drawn from the crown to the haunches, passing entirely within the surfaces of the voussoirs, the arch will stand; but when any part of the line falls out of their surfaces the stability of the arch is instantly destroyed. Enough, it is hoped, has been said to convince the artist of the necessity of balancing his arch with caution and as exactly as circumstances will allow; and where an equilibrium according to this theory cannot be obtained, the fertile mind of an ingenious artist will naturally furnish expedients to obviate the inconvenience likely to arise from a want of it.

Æsthetic and Ethic Emotions.

In the palmy days of Rome and Greece, before society became undermined by Persian luxury and effeminacy, the severer virtues held their due place as regulative principles of action in the conduct of mankind. The sensuous and spiritual elements of human nature were combined in their proper hierarchy of rank, and we have the example of this perfect interfusion alike in the sculptures of Phidias and the paintings of Polygnotus. But as luxury crept in this balance of power was destroyed; the sensuous got undue ascendancy over the spiritual element, and left the traces of its victory in the worthless frescoes of Pompeii and the repulsive statues of Commodus. A reaction set in under Christianity, but though in the right direction it was a reaction fatal to art, for it carried the moral element to such an extreme as to extinguish the sensuous, and human nature emerged from the conflict under Constantine maimed and stunted in some of its leading features and stripped of all that refinement which distinguished Rome and Greece during the youth of Pericles and Augustus. We cannot think, even at this time of day, without a shudder of the destruction of the temple of Serapis at Alexandria or the demolition of Jupiter's statue at Rome, by a crowd of fanatics who thought they were advancing the cause of morality by defacing the finest monuments that the genius of man had raised for the worship of the beautiful. The perfection of human nature which grew up in the minds of the early Christian ascetics, as well as in those of our Puritan forefathers, was a lopsided development of the purely moral element alone, with which all feelings of the beautiful and every representation of the sensuous was declared to be at war, and so ruthlessly thrust aside altogether. The moral element gained much strength thereby, but it was a factitious and not a natural strength—a strength waging war against the radical principles of the mental constitution, which it ought to have pressed into its service, and hence totally unfit to spread itself with vigour among the savage hordes whose wild passions steeped Europe in a thousand years of barbarism. As the perfection of the ideal consists in the proper equipoise of all the feelings and emotions acting in their proper rank and sphere, it is quite natural that when the balance is destroyed in favour of asceticism, the interests of art should be no less jeopardised than when the balance is destroyed in the interests of vice.

Literature and Fine Art.

It is commonly supposed that an inseparable connection exists between literature and the fine arts, but upon examination it would seem this is an erroneous opinion. They are both, in their highest efforts, the results of certain occasional states of the public mind affecting the peculiar endowments of individuals. In so far as the productions of literature suggest topics for the chisel or the pencil, it may be said an alliance exists between the sculptor, the painter and the writer, and inasmuch as the creations of sculpture and painting furnish matter for the descriptive pen, the connection and reciprocity are indisputable; but still there is a want of precision in ascribing that connection and reciprocity to any natural or necessary mutual dependence. In their highest as well as in their lowest faculties a distinctive principle peculiar to each is so clear and defined, that it may almost be described as an organic difference. Indeed, this distinction is so prominent that it requires some degree of consideration to discover any mutuality amongst them, the alleged connection being an after-thought, formed subsequent to, and in consequence of, the occasional aids they reciprocally give to each other. A horse as developed from the marble by a sculptor, and the horse of Homer or of Job, have no obvious moral similarity. The sculptor may exhibit both, but the one which is the product of his own conception and those which come from the suggestions of others will be very different. It is a curious fact, long determined by experience, that there is an imitative faculty possessed by many professors of the fine arts, altogether different from the peculiar creative faculty which constitutes the genius of a genuine artist. The fine copies of the great works of the old masters, as they are called,

are the productions of this imitative faculty. It would even seem that there is a third class of artists, consisting of those who have the power of embodying the suggestions of others, but which power deserts them to a great degree when they attempt to give form and pressure to their own conceptions. The noblest progeny of the arts, however, spring not from literature, but are of the artists' own minds. They come perfect from their imaginations, as Minerva from the head of Jupiter. Such are the works of Claude. From what book, or poem, or description, did that elegant and sensitive student of nature derive the subjects of his unrivalled pencil? The Apollo is equally the conception of the artist, and scarcely one of all the great pictures of Raphael can be said to owe their subjects to any literary description. The merest hints are all that literature has supplied to him. No doubt the intelligence diffused by literature assists in exalting and refining the spirit of artists, but it is not essential to them, as the fact of many excellent artists being ignorant even of the commonest generalities of literature sufficiently proves. In the time of Julius II. and Leo X., when the arts had attained a brighter ascendancy than they have since done, literature was not so generally diffused as it is in our time, when art is as much cultivated as it was in those epochs. Claiming, then, an independence for art from literature, acknowledging at the same time the reciprocity which exists between them, we assume that a taste for the one may be cherished without engendering any predilections for the other.

Brasswork in England.

In the reign of Edward III. the exportation of iron, either made at home or brought into England, had been prohibited upon the pain of forfeiting double the value of the quantity exported. And in the reigns of Henry VIII. and Edward VI. several Acts of Parliament had been passed prohibiting the exportation of brass, copper, latten, bell-metal, pan-metal, gun-metal, "shrof-metal," under the same penalty. The forementioned Acts of Parliament were partially repealed by an Act passed in the sixth year of William and Mary, by which it was rendered lawful to export, after March 25, 1694, all manner of iron, copper, or mundic (pyrites); but the prohibition of the other metals was continued. The brassmakers in 1783 applied for the same liberty which had been granted to the iron and copper smelters, a liberty of exporting the crude commodity. This liberty was not granted them by the Legislature, for the Bill, which had passed the House of Commons, was thrown out by the Lords. The Birmingham manufacturers presented a petition to the House of Commons against the Bill which was then pending, in which petition it was represented that frequent attempts had been made to erect manufactures similar to those of Birmingham in different parts of Europe, and that the excellence of some of the Birmingham articles depended upon brass of very different qualities, and that, fortunately for this country, there were several sorts of brass that were peculiarly adapted to the different branches of their manufactures, so that the sort which was suitable for one article was improper for another; and that they had reason to believe that the manner of adapting the various sorts of English brass to different articles in their manufactures was not known to foreigners, but that if free liberty was given to export brass every maker might be induced to discover the peculiar uses of his sort, and that very disagreeable consequences to their manufactures might thereby be produced. The petitioners also represented that brassmakers, in different provinces of this kingdom, had not succeeded in making the sorts of brass made in other provinces; and that one great company of brassmakers had not succeeded in making brass suitable for the Birmingham market, though they had professed an earnest desire to do so. And they humbly apprehended that there never had been such a quantity of brass exported as to render it a national object, and that there was not a probability of any such quantity being exported, though so much might be as to raise a ruinous competition to their manufactures, &c.

The Art of the Illuminator.

The patronage afforded by Charlemagne and his grandson, Charles the Bald, to the art of illuminating MSS. caused a greater number of beautiful volumes to be executed during the eighth and ninth centuries than at any other period, perhaps, that could be named. It is presumed that Italian or German artists (who worked after the models of the Greek school) were chiefly employed, and as a splendid instance of the mechanical skill thus exercised, the Bible of Charlemagne, preserved in the church of St. Paul at Rome, is probably not to be equalled, even at the present day. It affords also a decisive proof that the taste and execution displayed in ornamental accessories of MSS. did not decline in the same manner as the higher branches of composition and colouring, nor are to be judged by the same rules, but gradually advanced in perfection from the eighth to the sixteenth centuries. Manuscripts of the eleventh century exhibit very beautiful instances of borders,

particularly Greek MSS. executed for persons of rank, such as the copy of St. Chrysostom's writings, illuminated for the Emperor Nicephorus Botoniata, between the years 1078-81. The twelfth century is remarkable for a profusion of ornament and a graceful but intricate mode of illuminating capital letters, which renders it more easy to recognise manuscripts of this period than any other. In the thirteenth century the art of illuminating, in some respects, deteriorated, and endeavoured to supply in splendour what it lost in correctness of taste. The backgrounds of miniatures and initial letters seem like plates of solid gold, and the colours (chiefly red and blue, heightened with white) are worked up so as frequently to have the effect of oil-painting. This style prevailed most from about the year 1190 to 1230, and among the numerous splendid examples of it in existence may be instanced the Bestiary in the Ashmolean Library, the Weingarten Breviaries, preserved at Holkham, and the Psalter in the royal library, l. D. x. In general, MSS. of this class are of German or French execution. To the early part of the fourteenth century are to be ascribed the numerous MSS. executed in England and France, in which appear large initial letters of purple, red and gold, containing figures of men and animals, and terminating in spiral scrolls, which extend along the upper and lower margins of the volume, often supporting small groups or single figures of dogs, hares, apes, &c. During the fifteenth century the art of painting made rapid strides towards the perfection it attained in the subsequent age, and numberless examples remain in public and private libraries, exhibiting an endless variety of design and colouring. To particularise is scarcely necessary, where so ample a field is presented; but in beauty and richness of execution perhaps there are but few volumes which surpass the collection of the Poems of Christina de Pise in the Harleian Library, No. 4,431; the celebrated Bedford Missal, once in the possession of Sir John Tobin; or the collection of romances presented by the Earl of Shrewsbury to Margaret of Anjou, preserved among the royal MSS. All these were executed by French artists, whose skill was at this period generally patronised; and it is from the reign of Henry V. may be dated the decline of the art in England, since the close connection with France, and the Low Countries caused foreigners to be employed to the prejudice of native talent. The sixteenth century witnessed the final triumph of art produced by the successive pencils of Da Vinci, Raphael, Giulio Romano and Julio Clovio, and the numerous libraries formed during the latter half of the preceding century gave a stimulus to the success of these distinguished men. Miniature painting received a new degree of lustre and dignity from its being practised by artists who were also renowned for works executed on a grander scale. Of these artists, the one who rose to the highest degree of eminence as an illuminator of missals, and who seems never to have been surpassed, was Julio Clovio. His paintings are inimitable, and must be seen to be justly appreciated. They were chiefly executed for the libraries of Cosmo de Medici and the Cardinals Grimani and Farnese, and but few specimens of celebrity have reached this country.

Proportion in Architecture.

Proportion, in its simplest mode, is to form what time is to music, or measure to poetry; but in its more complex mode, it is to form what grammar is to language, or harmony to music. Proportion may be in the relative sizes of two or more objects—the relative dimensions that the length bears to the breadth of an object—the relative obtuseness or acuteness of various angles—the relative classes of curvature in various objects or in the parts of one object; or, it may be, in the general relation that various forms bear to one another in rendering their combinations harmonious. Proportion is, in short, that geometrical quality in forms and figures by which they are rendered pleasing to the sense of sight, independently of their use or any other consideration.

The Sphinx.

The commonplace book of Mr. Baldwin, once British consul in Egypt, contains the following solution of the figure of the sphinx:—"I have heard strange fables and strange conjectures concerning the Egyptian deity, but I have never met with its solution in the simple manner in which it has occurred to me. The sphinx is represented by a figure having the body of a lion and the bust and head of a virgin, forming together a figure composed of the two signs of the zodiac, Leo and Virgo, through which signs the sun is coursing at the time of the inundations of the Nile, from which Egypt derives its fertility and the people their subsistence. It was very natural, therefore, for an enlightened people, leading the opinions of their credulous and superstitious brethren, wishing to dedicate their gratitude to a Supreme Being, to attribute the felicity they derived from this immediate cause to the apparent one in the heavens; and, consequently, to compose a deity of those signs in which the sun prevailed during the inundations of the Nile, from which all their abundance necessarily depended."

NOTES AND COMMENTS.

IN England the actions and the defence to actions by municipal bodies are often evidence of a desire to be as free from responsibility for neglect as any despotic authority abroad. The Municipal Council of Sydney, New South Wales, appear to have imitated the English practice to that extent. Owing to the negligence of the Council in allowing one of the streets to fall into an unsafe state, a man who was driving a cart was thrown on the roadway and killed. The widow brought an action, and judgment was given in her favour. The Town Council, however, appealed to the Judicial Committee of the Privy Council, and the case was heard on Saturday. Judgment was given in favour of the Council. The reason given was that there was no obligation on the Council to keep streets in repair. In the Act 43 Vict. No. 3, there was the following clause:—"All public ways in the city of Sydney now or hereafter formed shall be vested in the Council, who shall have full power to alter, widen, level, divert, extend, construct, improve, maintain, repair and order such public ways and the footpaths thereof, and to carry off any water, mud or filth therefrom by means of sewers, channels or drains, or otherwise." In the clause there is an abundance of verbs of an active sort. But according to the Lord Chancellor they only empower the Council to repair, and do not prescribe that operation. There was no duty or liability in respect of the repairs of streets resting with the Corporation. Whether that was a satisfactory state of the law it was not for the Judicial Committee to declare. The verdict was accordingly entered for the Sydney Town Council. At a time when many colonial towns are suffering from financial embarrassments it may be prudent to avoid paying compensation for negligence, even when the amount is not excessive. But it is not advantageous for a city to shirk its responsibilities. It is quite plain that when the Acts were passed the repair of the streets was imposed on the Council, and any body of private citizens who attempted to discharge that duty would be liable to a penalty. The case is, however, remarkable as showing the infectious power of some of the English precedents.

THE city familiarly known as "dear, dirty Dublin" has an ill reputation for its neglect of sanitary arrangements. The superintendent medical officer of health has to admit that, with the exception of St. Helens and Belfast, Dublin has the highest typhoid fever death-rate in the United Kingdom. That is mainly caused by the condition of the soil, owing to the gross neglect of drainage during centuries. But there are also preventible defects in abundance. From the last report of the Dublin Sanitary Association, it is manifest that the domestic drainage system is in a deplorable condition. It was found that among the drains from the houses examined last year 50 per cent. were defective. The useless traps were in a corresponding proportion. The casings of closets which were defective were 55 per cent. There was a leakage from drains in about a fourth of the houses examined, but the leaking outside rose to 58 per cent. The income of the Dublin Sanitary Association in 1894 was 3867, and for so moderate a sum much has been done. The great obstacle to progress is the ignorance of the people and the want of self-reliance. When we find the President of the Association, who is a physician, saying, "The experience of the present winter is firmly to establish a growing conviction on my mind that neither the municipal authorities, nor the metropolitan police, nor the householders in our city and suburbs, have the remotest conception how the streets and footways should be cleansed and rendered safe in cold spells, when ice exists or snow has fallen," we may assume that in most other matters belonging to sanitation there is no less helplessness.

THE most important consideration in all Government departments in this country is to preserve the officials from trouble. What has to be sacrificed to attain that end is of minor importance. As a consequence, when work of any kind has to be executed by people who are not brought up in circumlocutory ways, it is truly right and just according

to the official mind that responsibility for the outsiders should be minimised. A typical illustration has been afforded by the Office of Works. In Dundee it is proposed to erect a post office. There, as in most parts of Scotland, separate contracts for the most important trades are adopted. Architects undoubtedly find the arrangement increases their labours, but it is established and it is found to be economical, as well as conducive to excellence in workmanship. Architects may, if they like, in their client's interest, undergo more toil without seeking a higher percentage. But it is not to be supposed that the fine gentlemen who condescend to spend a very few hours daily in a Government office could accept ordinary architects as models of conduct. Accordingly it was decided to introduce an innovation in Scottish practice and hand over the erection of the post office to a single contractor. Confidence in building as in political procedure is of slow growth, and it is not to be expected that northern contractors will engage in a novel experiment without allowing themselves a very liberal sum for contingencies. But what is a sum of that kind to an official who represents a Government that can readily raise millions? The saving in foolscap can be pointed out as an equivalent. Sir JOHN LENG, who has the interests of Dundee as well as of the country at heart, advised the First Commissioner of Works that the invariable practice in the district was to have contracts for masonry, woodwork, plumbing, &c., and that the builders as well as architects preferred it to any other. It has been adopted in costlier buildings than the post office. But Sir JOHN LENG could only regard the subject from the point of view of a man of business who recommended a course he had adopted in his own building operations, which were on the largest scale. He has yet to learn how insignificant economy appears under an official aspect. Mr. HERBERT GLADSTONE has enlightened him. Sir JOHN LENG is informed there is no precedent for his recommendation, or, as it is expressed in the grandiose style of Whitehall Place, "There is no record in the Department of objection raised to this system in theory, or of difficulty or inconvenience arising in practice." It is not stated, however, what price was paid by the Department whenever a system of contracting was revolutionised. Contractors, like other people, can submit to inconvenience when it brings them profit. The advantage of the innovation in Mr. H. GLADSTONE'S eyes is that his department will have only to endure one man or one firm. He knows that the work will be sublet to men without his approval, but it appears "the Board have always held that subletting is not necessarily an evil." No official cognisance, however, is taken of the inferior beings who undertake it; they give no trouble to the pontifical superiorities who preside over contracts, and as it is apprehended that master masons and master wrights and master plasterers of Scottish types might look on those who constitute departments, boards and offices as mortals, it is concluded that "no sufficient reason has been shown for altering a practice which is certainly convenient to the Department." To that convenience economy must be sacrificed. Such is government in 1895.

THE fascination that, happily for France, is exercised upon the thinkers of that country by English manners ancient and modern is suggested by the works to which prizes have just been awarded by the Académie Française. The Vicomte DE LA FERRIÈRE has gained the second prix Gobert by his "Courts of England and France in the Sixteenth Century" and "Love Dramas," which relate to ANNE BOLEYN and Queen ELIZABETH. M. LAFLEUR DE KERMAINGANT obtained another prize for his "A French Embassy to England in the Time of Henry IV.," and also M. GAVARD for his "Diplomatist from London." Among the works which have shared in the Prix Guérin are M. CHEVILLON'S "Sydney Smith and the Renaissance of Liberal Ideas in England in the Nineteenth Century," and M. MAX LECLERC'S "Education and Society in England." The principal moiety of the Prix Bordin has been awarded to M. J. J. JUSSERAND for his "Literary History of the English People to the Time of the Renaissance." When the Académie is found to be so partial to English themes it is no wonder French writers and artists are seeking models for imitation among us.

DESIGN FOR A ROMAN CATHOLIC CATHEDRAL.

THE ground plan of this church is based on the form of a Latin cross, like most of the cathedrals and many abbeys and other churches of the West. In the East the Greek cross, more approaching a square, is adopted, such as we see in Santa Sophia at Constantinople, St. Mark's at Venice, and many others. In the present plan the oblong, with its cross branches, forming the transepts in the shape of the Latin cross, has been adopted. The arrangement of piers, carrying the vaulted roof of the nave and its surrounding ambulatory, remind us in their solid treatment of the best specimens of Roman and Romanesque ecclesiastical buildings up to the twelfth century in Europe, and give the beholder a sense of strength combined with beauty, which some may prefer to the clustered pillars of the later Gothic period. The guiding principle of the earlier masters was simplicity and dignity. Their golden age began in Europe in the time of CHARLES THE GREAT and succeeding emperors and kings of the Holy Roman Empire. Some of the works they ordered are lasting monuments of beauty and strength, and combine Christian cheerfulness and deeply devotional feelings. Some of the Italian masters, though influenced by Northern Gothic, did not entirely abandon the hints given to them by the old masters of Romanesque architecture, and, though slightly adopting in their works some Gothic features, successfully united the gracefulness of the south, such as can be seen now in Italy.

The dimensions of the interior of the building, shown on the plate, are:—Length of the interior of the cathedral, 465 feet from inside of main entrance to back of apse; the breadth through transepts from inside of south side to north side entrances is 320 feet; the span of the dome is 116 feet; the height of dome is 168 feet; the nave is 50 feet wide and 112 feet high to crown of arch. The ambulatory on the ground floor (for processional purposes) is 10 feet wide. A similar ambulatory or gallery surrounds the cathedral on the first floor, and also arranged around the edifice. The design is by Mr. F. SANG.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, Mr. F. G. Hooper, vice-president, in the chair. Mr. W. B. Dukes was elected a member.

Nominations.

The house list for the next session, as prepared by the committee, was read over. The name of Mr. W. A. Webb was added to the list as member of committee, on the proposal of one of the members. Messrs. Arnold S. Tayler, J. H. Tyars, E. Greenop and T. C. Agutter were appointed scrutineers for the election.

Mr. JOHN BELCHER then read the following paper, entitled

Treillage.

Mr. Belcher said:—In addressing you this evening on "Treillage," it may be objected that I have selected a somewhat trivial subject, and one unworthy of the serious attention of an architect. But I venture to do so because I am convinced that (in the architect's hands) it is a simple and suggestive medium, by which he can obtain important and good effects in connection with gardens and domestic buildings.

Wherever wood construction has been in vogue varied treatment of "post-and-rail" and "lattice-work" has been in use all the world over.

India and Burmah, China and Japan, each has its characteristic treatment worked out with wonderful elaboration and finish. The familiar Cairo lattice-work is another variety of the same thing in the East, while every European country upon which the sun shines has its own method of affording shade and shelter by trellis-work.

The words "treillage" and "trellis" are sometimes used interchangeably, but the distinction between them would seem to be that treillage, originally at any rate, meant a series of posts and rails to support espaliers and fruit trees, while trellis was appropriated to mere lattice-work.

The comprehensive title of "trellis"-work is now, however, in general use for all varieties; while treillage is a technical term (obviously from the French). "not generally understood of the people"

Treillage probably originated in Italy, in vine-training, and its use extended for trailing plants and creepers. It thus came to be used in pleasure gardens in connection with trellis proper, and a recognition of its use and beauty so combined led to its adaptation to architectural treatment. In old tapestries as well as in illuminated MSS. you will find trellis-work and palisades represented in many garden scenes. There is a beautiful picture by Luini (date about 1495) entitled *Our Lady of the Lattice*, which shows that treillage was appreciated by the painter.

Mr. Reginald Blomfield, in his book on "The Formal Garden in England," gives an illustration of a garden dating from the latter part of the fifteenth century. It is taken from "The Romance of the Rose," in the British Museum. It is a walled-in garden subdivided by a trellis fence in which is an arched gateway with trellis gates.

Again, there is a very suggestive example in "The Gardener's Labyrinth," published in 1577. The gate at the top is the exit into the open country beyond, and the archway on the right is the entrance which communicates with the cultivated grounds. The central enclosure is formed of ornamental pilasters and trellis-work.

I do not propose to attempt, even if I were able to do so, any historical description of the gradual development of trellis-work. My object is to suggest its more extended use and recognition. I would point out that it has a poetical and romantic side as well as a useful one. Such a medium may be to the architect what clay is to the sculptor; in it he may venture to give shape to some poetic dream of ethereal architecture which has visited his brain, or at any rate (if this seem too large a flight of fancy) he may realise, if only temporarily, some playful fancy for his own satisfaction in work which, from the very nature of its material, cannot be taken seriously, or raise great expectations. It is the ease and facility with which daring experiments can be made which render it valuable. It can be altered and shifted at pleasure until the desired effect is obtained in a way which more solid and valuable materials prohibit.

And it thus affords opportunities for judging effects which may subsequently be translated into stone or brick. So that those workers who are yet in the flush of youth, and who possess that enthusiasm which in youth is the natural prescriptive right of all, while its retention in advanced age is a special grace given but to the few, may yet find in trellis-work a means of expression of their "soarings after the infinite." To the student it presents the advantage of a material in which he can try experiments. He can buy a bundle or two of plasterer's laths and interlace them, and form panels and arches and many devices within a few feet of the back wall of his garden, which will increase its interest. And beyond all this I think trellis-work itself is capable of a further development, of being adapted to other uses than those to which it has hitherto been applied, uses for which its nature and lightness render it suitable, while its decorative character must be recognised by every artist.

As its form and use grew out of the necessities of the garden I will give priority to the consideration of its use and value in laying out a garden. I suppose I may take it for granted that an architect admits the importance and recognises the advantage of the "formal" garden in the immediate proximity of his building.

The T-square and set-square should be used in planning the courts and spaces outside the four walls of the house. Its straight lines should be extended and linked with nature, stretching out on every side like tendrils to attach it to the soil. This is effected by enclosing garden walls and entrance and kitchen courts by terraces and tennis-grounds.

My partiality for the formal old English garden tempts me to a dissertation on its advantages, but I must confine my remarks to the employment of trellis-work to obtain certain effects.

In the art of laying-out a garden, as in architectural design, there is a certain seductive mystery gained by partially concealing and judiciously screening some parts from immediate view. By this means the imagination is tempted to conjecture the presence of hidden delights beyond, and interest is quickened in expectation of some further enchantment.

Besides the fact that divisions of some kind are necessary for such surprises to the casual visitor, they have always the additional and permanent advantage of affording seclusion, quiet and comfort. The very flowers and shrubs enjoy the retreat, for in the shelter they luxuriate, and their sweet fragrance is not dispersed by rude winds. Tall hedges of yew, laurel or holly form substantial divisions, but years must elapse before such hedges can be effective. And here the common or garden trellis will prove the temporary substitute. Against

it the hedge can be planted and protected and trained. On the wood-trellis roses, clematis, jessamine and honeysuckle will climb readily, and show their preference for it over cold and un congenial iron rods and chains or wire.

With the flexible laths, deep archways can be formed in the trellis division just long enough to form a dark frame to the picture beyond. Or if a peep is required here or there, a few laths can be cut and a bent piece or hoop of wood, circular or oval, inserted, forming an unglazed window in the trellis or hedge. There is an example in the Penshurst garden.

Again, should it be desirable that the upper part of a high screen, or parts of it, be more open or only partially hide what is behind it, then the trellis can be cut into patterns more or less open as desired—sometimes in panels, sometimes in a running pattern.

It is to the credit of lawn-tennis, from the point of view of the architect, that it has given him an opportunity to make some formal division of the grounds; and in this case the trellis screen is of such obvious utility in protecting the flower-garden that it will appeal to most clients. If the ground for the tennis-courts is sunk, as it should be, the height of the slope and fence combined will suffice to stop the balls passing beyond.

How difficult it is to persuade a client to screen off any part of his ground. He has an idea that he will lose something unless he can see it all at once—that the extent of his possession will not be appreciated by others.

An Englishman will go any length to obtain a separate compartment to himself in a railway train, yet has not the same desire for seclusion on his own land. His active temperament and love of exercise draws him to the open country; whereas the Dutch, on the other hand, whose grounds are restricted, like repose and seclusion, and the Chinese, who are not walkers by choice, prefer to cram into the smallest area diminutive imitations of nature in every mood, with mountains, rocks, water, rivers, bridges, all in strange profusion and exaggerated quaintness.

Examine an old willow-pattern plate and see the trellis-work in use, the palisading, the bridge, and the varied trellis patterns suggested in the margin. I can only allude to foreign work now, and must confine my attention to our own traditional methods, which have been largely formed on the Chinese.

Judging from the accounts preserved of work done by Henry VIII. at Hampton Court after Wolsey's death in 1530, he must have made use of treillage and trellis very largely. We find described 180 posts and "960 yds. of rayle," painted white and green.

In the design of the garden in "The Gardener's Labyrinth" we have evidently an early architectural treatment, showing pilasters or terminals with panels of trellis-work. In some old gardens the enclosures are shaped and laid out in geometrical forms, niches for statuary or vases, circular apses for family or social gatherings, and sheltered places for one or more. I have just completed in this manner a rose garden with a rose temple, of which I have brought you the plan and details. Open seats in the shade are preferable to the highly-varnished "rustic summer-house" atrocity, which is the cockney's delight.

Treillage suggests the shady walk or covered alley. The posts with top rail and cross rails on which may be grown roses, honeysuckle and such like. The Italian treatment of the horizontal tie is excellent, the shaped ends projecting beyond the post; in profile they group well and look picturesque. The Chinese and Japanese have a similar treatment of the horizontal bar over entrances, but the ends are turned up.

Bacon in his essay on an ideal garden says:—"For the ordering of the ground . . . I leave it to a variety of device . . . Little low hedges, round like welts, with some pretty pyramids I like well, and in some places fair columns upon frames of carpenters' work." These trellis columns are very effective and can be used for garden retreats and in conservatories, for round them many flowering creepers can be entwined.

One of the most successful examples I know of open trellis columns and entablature and cornice is in the garden of Mr. Alma-Tadema. It was carried out some years ago by Mr. Brydon, who has most kindly lent us his drawings. You will appreciate, I know, these working drawings and studies. Nothing could be better than this bit of trellis architecture, which is beautiful in summer and winter alike.

I will ask you to note the plan. Its arrangement gives length to the lawn while the open appearance is still preserved; but in walking along the pathway the spectator is partially screened, and enjoys a succession of framed pictures between the columns. At the circular apse round the edge of the semi-pond the columns are placed closer together and form a protective fence. They are reflected with their rose attire in the water beneath them, a happy mixture of nature and art. It is not architecture in the severe and solemn stateliness of public life, but, as it were, relaxing in private, and with light and playful fancy mixing with the flowers in their own domain; disporting with freedom in the sweet seclusion of the garden enclosed.

It may be well, while we have so good an example before

us, to examine the detail and construction, and learn how this fairy-like effect is obtained. There is first of all a certain commendable and quiet humour evinced and maintained throughout.

The interpretation of columns and entablature into trellis-work is worthy of your attention. The "flutings" of the column are represented by the voids and the "fillets" by the laths. In the lower part of the columns, to one-third of their height, there are "reeds" represented by circular rods. The laths and reeds are fastened to rings at intervals. The "Ionic caps," with their "volutes," are ingeniously managed. The introduction of the "triglyph" in this "order" is also amusing. Then a fretwork pattern is happily introduced in the fascia, and round balls at regular intervals in the bottom member. These devices I shall have occasion to notice in pointing out developments in some seventeenth-century examples. There are other architectural garden "properties" shown on the drawings which go to prove how adaptable trellis laths are to curved and other work.

In 1773 Sir William Chambers published a "Dissertation on Oriental Gardens," and illustrated his designs for the Pagoda and Chinese temples at Kew. I have reproduced one example. His work probably encouraged and extended the use of trellis-work in England, so that trellis verandahs and porches became exceedingly popular. They were used not only in favourite seaside resorts and suburban residences, but examples are also to be found in fashionable neighbourhoods and round the parks. And I now propose to draw your attention to some examples of these which I have collected, and which are either good or instructive.

In Piccadilly, for instance, there is a good and refined example at the residence of the Duke of Cambridge. It is of the "Adams period." The division of this long verandah is effective. The larger openings are in front of the windows, and the intermediate arches, with their double circle ornament above, make a pleasing diversity. The construction is very light and suitable to a balcony carried on consoles.

Example No. 2, at the Marble Arch, is inferior though good in its way. The projecting porch no doubt determined the width of the arches, and the divisions are filled in with lattice-work. Here the fascia is open and the pattern varied. You will see the same fascia pattern in Example No. 3, at the corner of George Street, Hanover Square. This is a most fascinating one of excellent proportion. Here we see a valance introduced under the gutter (a feature which found great favour with engineers in finishing the platform covering to railway-stations).

In Example No. 4 there is a similar valance both to the verandah in the right-hand corner of the view and that to the bow window. The latter is carried by slight reeded columns and caps; between these is a kind of trellis curtain and fringe of bells which gives it a Chinese flavour.

There is another form of valance and post to the upper balcony in Example No. 5. The lower balcony, which has evidently been designed from trellis examples, cannot, however, be claimed as such.

Still another variety of "valance," and probably an earlier one, is seen in the interesting Example No. 6. And I have seen others showing a still more realistic curtain treatment, which I fancy must have been designed by the same hand, for the intersecting circles in the pilaster and filling in of the spandrels of the Tudor arch are the same.

In Example No. 7 we have a departure from the lattice-work and a more open treatment of the divisions suggested by Chinese examples.

A most striking and clever adaptation of Chinese forms is seen in Example No. 8, and the panel over the arch shows how openings can be ornamentally formed in the trellis-work.

Example No. 17 is a good and simple bay-shaped verandah. The treatment is excellent. I commend it to your attention when you are passing Grosvenor Gate. It is at the corner of Upper Grosvenor Street.

The other examples are but variations on those I have already described. Nos. 13, 14, and 15 are taken from designs by C. Middleton, published in the last century by J. Taylor.

In passing, I should like to draw your attention to the wrought and cast-iron railing enclosures to the balconies; they partake of much of the refinement of the period of the trellis verandahs.

I have refrained from describing examples of iron trellis-work, as I consider they form a separate subject. I have, however, brought one or two examples. The one from a house opposite the Marble Arch is good, and the treatment of the balcony railing interesting.

The stone or marble trellis of the East, and the marble trellis of Italy, contain many forms which can be translated into wood treatment, but it cannot be too strongly insisted upon that the forms suitable to one material are unfit for, and should not be imitated in, another.

The construction of fences, arches, verandahs and porches in trellis-work is exceedingly simple. In division fences the posts vary in thickness, according to their height and distance

apart, and are frequently finished with some sort of terminal; a small fillet is all that is used to keep the ends of the laths in position against the posts. The top and bottom rails are often plain, the top having a projecting cover piece, or are sometimes moulded, and the bottom rail is kept well off the ground. The laths are arranged in several ways and in larger or smaller meshes, as lightness or increased density is required.

In garden fences the laths are sometimes interlaced, but more usually they are laid across each other, and pinned together in squares or diamonds. Other variations are obtained by doubling the lines of the pattern, as shown on some of the examples before you.

When, however, in verandahs and porches, for instance, other geometrical forms are needed, they are made up of circles, curves and radiating bars, mostly put together in sections, though some of them are cut out, and form a species of fretwork.

Instead of the ordinary thin lath, strips or fillets of greater thickness, ranging from $\frac{3}{8}$ in. by $\frac{1}{2}$ in. and upwards, are used when the pattern is very open. The columns at 17 Grove End Road, N.W., are constructed in this manner, as are those in Example No. 20, but in other examples the columns are formed of laths on rings, in which case a centre post is necessary. No. 20 is an example in which a thin lath is twisted round the column. It is not only graceful, but serves to bind together the sheaf of laths.

The porch in Example No. 19 is a typical one, showing the curved and interlacing circles. It is put together in pieces with brads. I have figured the sizes of the several parts. Other devices I have mentioned, such as the use of turned wooden balls or reels, used to separate the constructional posts from the smaller pieces between them. They are well shown in No. 9 and also in Nos. 1, 6, 8. In Example No. 2, instead of the ball, the division is made with square fillets.

The "ball" is also used as a fringe ornament as in Example No. 10, and is easily nailed to the soffit.

In Example No. 6 a three-quarter circular rod has been cut up into inch lengths, which have been fixed under the fascia as a kind of dentil course. Square dentils are also frequently used, as they are easily bradded on the cornice.

In many of the best examples of verandahs we may note that the constructional timbers are reeded, or treated with a hollow moulding to secure a light appearance. Small reeded columns are not unusual, as in Examples No. 4 and No. 10, and indeed form a very characteristic wood treatment of the period. The caps to such columns also are interesting, and some in form resemble a mushroom button, as in Example No. 18.

In Example No. 16, which is taken from Weale's "Carpentry," published in 1852 (a book which contains examples from Brighton), the details of the construction are given.

In trellis designs it is the solids and voids which must be taken into consideration. How admirably this has been calculated in No. 6. The dentils and the valance, &c., stand out against the black void.

Garden seats with trellis-work backs were very general in the last century. The backs, and sometimes other parts, were arranged in panels very similar to those on balconies. Such seats have been reproduced in many forms by Mr. Marcus Stone in his pictures. They are so excellent in design and so ornamental to the garden that a revival of the treatment may well be advocated.

It would no doubt be generally difficult to supersede the imitation rustic seats in cast-iron and other cheap forms of garden-seats; but for special positions, and particularly where a circular seat is required, place should be found for the work in wood. There is a good seat designed by Mr. Blomfield, which he has kindly lent me with other drawings.

In connection with treillage I must not omit to mention the several forms of palisade already hinted at. The earliest decorative one is the example I have taken from Mr. Blomfield's book. Later ones consist of variations of the post and rail, with plain or shaped laths of more or less elaborate design.

Colour was largely employed in emphasising the forms of trellis-work. Green and white, and red and white were the colours in vogue in old work, if we may rely on tapestries and the painters' accounts preserved.

When, however, oak is used in garden work, the delightful silvery tint it gains with age is valuable. If the work is in deal then the dark green is most effective. For verandahs, &c., the dark green also tells well against a plaster or cement background, but when the brick wall is dark in tone, then white or stone colour looks well.

With regard to the further use of trellis-work, I have hinted at, I might say that one amongst other ways in which its use might be developed is in internal domestic work. The staircase affords an opportunity, as, instead of the ordinary baluster, some trellis pattern can be effectively adapted.

There is one on the screen which has been designed from an old example I found in a house in Gloucestershire. And I have also seen beautiful trellis enclosures to the landings on an old staircase, carried up to the ceiling, with arches, pilasters and window openings of quaint design and detail.

Opportunity is also afforded to the County Council for the use of trellis-work in the erection of "band-stands" in the people's recreation grounds. The pavilion designed by Sir W. Chambers is very suggestive and quite adapted to such a purpose. Light ironwork is too brittle, and is easily broken, whereas the wood gives, and even if a lath is snapped it is more easily repaired than ironwork. Their garden seats and shelters also afford excellent opportunities for its use.

Doubtless you can call to memory many a quaint and beautiful example of trellis-work in screens, colonnades, verandahs and porches. Indeed, there are so many still existing in localities now remote and retired, but which were fashionable last century, that it is not possible to produce here more than a few typical examples.

It is sad to think that when these interesting neighbourhoods come to be opened up for so-called improvements, red brick with terra-cotta trimmings will be substituted for the houses and their contemporary trellis-work.

If only we might return again to the simple brick or plaster front without an ounce of unnecessary detail, but decorated with some festive little trellis balcony or porch, how refreshing it would prove, and would be less costly and quite as lasting.

A well-designed piece of trellis-work gives to the substantial building to which it is attached something of that grace which is lent to garden architecture by the natural growth of creepers.

I know that much more might be said, and better said, in favour of trellis-work and its more extended use; but I hope I have said enough to rouse your interest in it, and that the examples I have brought to your notice at least warrant my drawing attention to the subject of treillage.

Mr. J. M. Brydon proposed a vote of thanks to Mr. Belcher for his paper, which was seconded by Mr. A. S. Tayler, and passed by acclamation.

As proposed by Mr. Goldsmith, hon. secretary, the formal proceedings were terminated, and, under the guidance of Mr. Belcher, the members examined the illustrations shown on the walls.

GEORGE MEIKLE KEMP.

THE separation by oceans does not make Scotsmen forget their countrymen. It is remarkable that attention should first be called to the duty of commemorating the existence of the self-taught architect, G. M. Kemp, in the columns of the *Scottish American*. In that journal is the following article:—

There is one centenary which will occur soon that should not be overlooked, especially by Scottish architects and mechanics. Its celebration would honour the memory of a man who made Scottish architecture famous, and who rose from the carpenter's bench and graduated from a country workshop to build a monument which is yet the most stately and beautiful in the three kingdoms. This was George Meikle Kemp, the designer of the magnificent pile which not only commemorates Sir Walter Scott, but is one of the landmarks of Edinburgh. He was born in the clachan of Moorfoot, near the Gledhouse stream, on the southern border of Midlothian, on May 25, 1795. His father was a shepherd. Nothing of the clachan now remains except an old farmhouse, all the rest having been swept away, apparently for business purposes. Excepting for the accident of birth, however, Moorfoot had little to do with Kemp, as on the day on which the future architect was born, he and his mother had to be carried to Newhall. This was due to the fact that their cottage and the other cottages in the hamlet had on that very day to be given over to a squad of miners. Young Kemp received his education in the parish school of Penicuik, but his school studies were carefully supplemented by home tuition. His father, although a shepherd, was a man of considerable intellect, well read and eminently pious, and he supervised the studies of his children and trained their minds, much as William Burness did those of his family. Indeed, in many respects the father of the architect was similar to that of the poet; and one of Kemp's sisters used to say that the "Cottar's Saturday Night" was just a picture of what was to be seen in their own household.

Kemp was apprenticed in his fifteenth year to a carpenter at Redscarsland, a village between Eddleston and Peebles, and served faithfully for four years. During that time he had made a visit to Roslin Chapel, which he had seen with delight several years before, and carefully studied all its details, thus unconsciously beginning his real life work. When his apprenticeship was over he tramped to Galashiels, and "struck a job" there, as they say in America. His employment made it necessary for him to travel considerably to make repairs and other work. Mechanics in those days—there were no railways—had to tramp around on shanks naigie, unless when by chance they got a "lift" part of the way in a cart. Kemp's journeys on foot, however, were the best helps he could have got, as they made him acquainted with such grand old ruins as the abbeys

of Kelso, Dryburgh, Jedburgh and Melrose. With the last he was particularly struck, and he knew the design, the purpose, and even the sentiment of every stone in it better than any man in Scotland in his day or since. Melrose and Roslin were, in fact, his two ideals of architectural beauty. Had it been deemed advisable to have restored Melrose to its old beauty, he would have done the work perfectly. He would have pleased alike the antiquary and the utilitarian spirit of the age, and committed none of the blunders which so long made the work of restoration of old buildings ridiculous.

Leaving Galashiels, Kemp worked for a time in Edinburgh. He carefully studied the ancient architecture with which that city then abounded, and made long tramps about the neighbourhood visiting buildings of interest. Then he tramped into England and visited the famous Minster of York and other structures. Returning to Scotland he worked, always at his trade of a carpenter, in Glasgow, mainly for the purpose of studying its ancient cathedral. Another sojourn in London and a brief journey in France (starting on his continental tour with a few shillings in his pockets) completed his rambling life—his life of preparation.

Returning to Edinburgh, he entered into business as a carpenter; but trade was dull, and he soon gave up the task of making a connection among "Auld Reekie's" builders. His ability as a draughtsman was fully recognised by Mr. William Burn, the most noted Scotch architect of the day, and by that gentleman he was employed in preparing working drawings for the present mansion-house of Bowhill. He also prepared a model in wood of a new palace for the Duke of Buccleuch, which was highly prized by that nobleman, and is still preserved at Dalkeith. Kemp's most important work at this time (1830) was a series of three large and faithful views of Melrose Abbey. "These drawings," says Kemp's relative and biographer, Mr. Thomas Bonar of Edinburgh, "were exceedingly accurate in outline, minute in detail, and so exquisitely finished that they attracted considerable attention in the Scottish Academy Exhibition of that year, and were purchased at a liberal price by Thomas Hamilton, the architect." While making these drawings Sir Walter Scott approached the draughtsman and examined the drawing, but his attention was called from the spot, and in paying courteous attention to some ladies the "Wizard of the North" did not find the opportunity to return. Kemp never failed to regret the ill-fortune that did not permit the great poet to pass judgment on his work.

One of the greatest disappointments of Kemp's life was the treatment he received in connection with the restoration of Glasgow Cathedral. He had fully studied that structure and was thoroughly acquainted with its details. He made and published a series of drawings showing how the old structure might be restored to its former magnificence, and every one of these drawings was simply a carrying-out of the lines of the cathedral as they once actually existed. He also prepared a model of his proposed design in wood, so that the citizens of the "Western Metropolis" who were not architects might see at a glance what he proposed doing. The Government of the day was appealed to and took the matter and the plans under advisement, but hesitated to do anything, and professional jealousy (which exists among architects, apparently, more than any other class of men) raised quite a discussion over the subject. It must be remembered that most of these people looked upon Kemp as a carpenter rather than an architect. The matter for many reasons was dropped for the time, and many years later the cathedral was restored by a London architect. Undoubtedly this man did good work, but a reference to Kemp's drawings makes it very evident that Glasgow suffered a severe loss when these were passed over. He was a mechanic, an architect, an antiquary and a poet, and all these qualities that come under these designations were needed to make a fitting resurrection of the old shrine of St. Mungo.

The great opportunity of Kemp's life came to him in 1838, when, out of fifty-four designs submitted for a monument in Edinburgh to Sir Walter Scott, a drawing which he submitted was one of the three selected as prize-winners. In a subsequent competition he submitted a much more elaborate and finished plan, and it was adopted. That is the monument of which Edinburgh is so proud to-day. Kemp was appointed to supervise the work, and devoted his whole thought to it. The foundation-stone was laid in 1840. Its general design and details were really adaptations of the architect's studies in Melrose, and it deserves the designation which has been given it of being "a poem in stone and lime." Kemp, however, did not live to see the work more than half completed. On the evening of March 6, 1844, while proceeding along the Union Canal to see some stone that had been brought from the quarry for the monument, he missed his footing in the dark, fell into the water and was drowned. His sad "taking off" was deeply regretted, for the man had made many friends by his lovable character, and his great genius was just receiving its merited recognition—was just being discovered and appreciated.

Kemp forced his way to the front through the force of his own genius. If ever there was a self-educated man in Scotland that man was George Meikle Kemp. He enjoyed none of the educational facilities now placed in Scotland within the reach of the poorest. He had no patron to send him to some of the centres of learning. He started the battle of life at an early age, and had to keep steadily on in the grim task of earning his daily bread, and all the knowledge he acquired was the result of hard study, of constant thought, of hours spent with the pencil when mere amusement, perhaps worse, marked the leisure time of his fellow workmen. His life is an example of what Scotch grit, energy, determination and perseverance can attain, and for the sake of the lessons to be derived from that example alone the century of his birth should not be allowed to pass unnoticed.

LIVERPOOL SCHOOL OF ARCHITECTURE AND APPLIED ARTS.

THE Liverpool School of Architecture and Applied Arts was formally opened on the 10th inst. by the Lord Mayor of Liverpool. In the course of his address he said Liverpool as a school of art would perhaps be thought to have but few claims. That would, however, be doing but scant justice to it or to its citizens, many of whom had laboured long and successfully in many departments of art. In 1768 the Royal Academy was founded, and in the following year, when the population of Liverpool was but 34,000, a society was formed for the protection and encouragement of the art of painting and sculpture, which, however, lasted but a short time. A second society was within five years founded in which architecture, anatomy, perspective and chemistry were taught, and one of its members was their illustrious townsman, William Roscoe. The principal object of that society in their own words was "to assist youths in their studies to the best of their power without expectation of pecuniary advantage." That society lasted only two years, but during its brief existence a public exhibition was held and eighty-four pictures were hung, and it was interesting to note that among the amateur exhibitors were members of the Rathbone family. It was very encouraging to observe the persistent effort to take part in and assist the revival of art which had now set in, and which was perhaps for almost the first time in its history bringing this country into prominence. The next society was founded in 1783, having the same object in view, the encouragement of painting and the allied arts, and of that society William Roscoe was vice-president. Classes were formed for the instruction of art students, who were admitted free of charge. An exhibition of the society was held in 1784, which was probably the first ever held in a provincial town. A large building in Rodney Street was utilised for that purpose, and among its exhibits were two contributions from Sir Joshua Reynolds. In the preface to the catalogue a graceful tribute was paid to that illustrious painter, "because he has not thought it improper to favour the society with his performances, a circumstance which, whilst it dignifies this undertaking, reflects the highest honour on his candour and politeness." That society, too, shared the fate of its predecessors and was brought to a close by the outbreak of the French revolutionary war and the revolt of the American colonies, which seriously interfered with the prosperity of Liverpool. In 1810 the Liverpool Academy was formed and William Roscoe was again one of its members. The Liverpool Academy was therefore the oldest institution of its kind in the country, with the exception of the Royal Academy and the Royal Society of Water-Colour Painters. In 1811 Mr. Henry Blundell, of Ince, one of its patrons, died and left the sum of 1,600*l.* towards the establishment of an academy of art. On the opening of the Royal Institution in the following year that amount with accumulated interest was handed over to the trustees on the understanding that the academy should be housed in the institution buildings for ever, and up to the present time the academy had held classes there for instruction in art. In 1831 a "society of gentlemen of taste and opulence" was formed for the encouragement of the fine arts; the Mayor and Mr. Thomas Brancker were among the number. Prizes were given at the academy's exhibition, first by the Corporation and then by the society, who on seven different occasions awarded a prize to the pre-Raphaelite school, which, being the first recognition of that school, created so much opposition and dissatisfaction that the academy succumbed to it about 1862. In 1871, by the efforts of Sir James Picton, Alderman Samuelson and Alderman Philip Rathbone, the present Autumn Exhibition of pictures was established, and during the coming autumn its silver anniversary would be celebrated by the holding of the twenty-fifth annual exhibition. As a result of those efforts Liverpool possessed one of the finest—perhaps the finest—collection of works of art in the provinces. The Walker Art Gallery was formally opened to the public by the Right Hon. the Earl of Derby in 1877, new rooms were added in 1884, and at the present time additional accommodation was

urgently needed to display the growing collection of art treasures. But Liverpool had done something more than this for art. Some of her citizens, following the example of William Roscoe and those associated with him, had spent time, effort and money in the teaching of art. The Government School of Art founded in 1852, the outcome largely of the impulse of the Great Exhibition of 1851, and the Government Normal School of Design, the first national effort to foster art, was immediately taken hold of by them. The art classes of the Liverpool Institution were formed in the years 1833 to 1840, and so successful were they from the first that as far back as 1842 they were attended by more than 400 students in mechanical drawing, architectural drawing, naval architecture, landscape and perspective, painting and modelling. These classes in 1855 were formed into a Government School of Art, in which their usefulness had been immeasurably increased. A noble and imposing building attached to the Liverpool Institute had been erected, the generous contribution of one of Liverpool's noblest sons, one who was credited with a vastly nobler act of generosity to this city within the last few days, a generosity that far and away distanced any previous similar act of philanthropy in its history. Liverpool owed much to its public men, but to none did it owe a deeper debt of gratitude than to him who, through many years of quiet, unostentatious and persevering effort, had laboured to advance the education, the culture, the well-being and the happiness of the inhabitants of this great city. Architecture as a branch of art did not appear to have received the encouragement its importance demanded, but Liverpool could boast of not being altogether behind even here. The Free Public Library possessed upwards of 1,000 volumes of books connected with the architectural school, which must be of immense advantage to students. Liverpool, too, could boast of many choice specimens of architecture. St. George's Hall was a building of which Liverpool might well be proud. It stood a unique specimen of civic love for art, it had furnished an object lesson for all students, and it had encouraged and elevated the taste of the municipality, and its effect might be seen in the architecture of the city generally. The school which was to be formally opened that day in that building would be inaugurated under most favourable conditions. Other men had laboured, and his hearers were about to enter into their labours. Hitherto the funds necessary for that work had been furnished mainly by private philanthropy; now the Government grant in aid of technical education would be available, and the status of that University would add greatly to its efficiency. It came at an opportune moment. Education was vital to the interests of the nation. A fierce competition lay before them, and it was essential that the rising generation should be fully equipped to grapple with it. The responsibility and the honour of that work was in their hands, and they all felt that its success was assured. He had great pleasure in formally declaring the school open, and calling upon Mr. T. G. Jackson, A.R.A., to deliver the inaugural address.

Mr. Jackson said the establishment of such a school as that under the combined auspices of the city and University could not fail to influence in one direction or another the current of artistic education not only in Liverpool, but in the country at large. Efforts to a certain extent resembling theirs were being made in other places throughout the land. Technical schools and institutes were rising up, and were substituting new methods of training for those to which hitherto they had been accustomed. Their scheme, too, had many features which distinguished it from others, and gave it a special interest in the eyes of the rest. While their students would learn the work of different handicrafts and the principles of construction, they would also be trained to consider the æsthetic result of what they were doing—to design work which was not only well considered and well put together, but beautiful, and not only beautiful but beautiful in the best way, expressing outwardly the ideas and methods by which the work had been produced. Dealing with the necessity for the artistic element being embodied by the architect in his work, he said artistic instinct was born in a man, and could not be imparted if he was born without it. Unless a man was born with an artistic temperament, it was useless of him to attempt an artistic career; but though a man might be of the right material to begin with, training and education were required to enable him to use his natural gifts to advantage. Like all experiments, this new school had advantages which should not be overlooked. The whole system of teaching crafts was still in the experimental stage, and they were still in the dark as to what would come of it. Alluding to the technical education schools supplementing the old system of apprenticeship, he expressed the conviction that no training in schools would ever give an architectural pupil the same insight into the proper conduct of his work as that which he would get in his master's office, and in this connection he contrasted the training which architects received nowadays with that obtained by those who built our great cathedrals and other historic buildings, and who took an active part in the raising of the structures. The modern archi-

tect, he said, resembled the professional man and designed his buildings on paper from a distance, and under the present system he was seldom brought into contact with the materials that were used in building. That was especially the case with learners, but by means of schools such as the one they were opening that day he would be brought into contact with those materials, and he would come to the task of designing with a stock of ideas and a capacity for invention not to be got in any other way.

Sir W. Forwood, as chairman of the library, museum and arts committee, which had been associated with University College in the inauguration of that school, proposed a vote of thanks to Mr. Jackson for his address. The necessity for a school of architecture was fully made out, and he was glad to think that it had been generally welcomed by the public of Liverpool. They had been very fortunate in securing a professor of the eminence of Professor Simpson, and if the public demanded that their houses should be better finished and better designed they would quickly fill the school with apt pupils who would be trained to carry out those works. That school was indebted for its inception to Mr. Philip Rathbone.

Alderman Rathbone, in seconding, said he should have wished the school had been called the School of Architecture and "Allied," and not "Applied," Arts. As a consequence of the improvements in machinery they were constantly liable to gluts of cotton, gluts of corn and gluts of various products, but there could be no glut of beauty. Every fine building erected did not displace or render needless some other fine building. They had come to the age of civilisation, and they had to rebuild the whole of their towns to make them in any way worthy of the towns that were built 500 years ago. They could not create genius, but they could give genius an opportunity of showing what was in it.

Mr. Jackson, in replying, wished success to the new school, and said he hoped to hear great things of it.

THE NEW VELASQUEZ.

AMONG the latest presents to the National Gallery is a painting by Velasquez from Lord Savile. His lordship gives the following account of the work:—

It was for some years in the possession of Sir Edwin Landseer, by whom it was exhibited at the Old Masters' Exhibition of the Royal Academy in 1873, under the title of "Signing the Marriage Contract between the Infanta Margarita Maria, daughter of Philip IV., and the Emperor Leopold." This designation, however, was incorrect, for that event took place in 1664, four years after the death of Velasquez.

It is evident that this painting does not represent the betrothal of a Spanish Infanta, who, even as a mere child, was a very important personage, as is seen in the celebrated picture by Velasquez, called "Las Meninas," where the little Infanta is attended by two maids of honour, a lady in waiting, a chamberlain, an equerry, and two dwarfs; whereas in the National Gallery picture the child is accompanied by a single female, probably its mother. There is nothing in the picture to connect the scene with royalty, and it is evidently the representation of a betrothal in a private family, probably that of Velasquez himself.

If this surmise be correct, the principal male figure would be Velasquez as a Knight of the Order of Santiago, the red cross of which, though half concealed, is seen on his cloak; the mother presenting her child would be his daughter, the wife of the artist Del Mazo, his pupil and son-in-law, and the girl their daughter, the grandchild of Velasquez.

The foreground is occupied on the right by a half-length figure of the poet Quevedo, with a huge pair of horn spectacles, as he is represented in his portrait by Velasquez at Apsley House, though here he is a much older man. He was a great friend of Velasquez, and in this picture may represent the witness to the betrothal of the artist's grandchild. On the right is a negro, probably Juan Pareja, the favourite slave of Velasquez, who is conveying a basket of fruit to his young mistress. Velasquez himself is waiting, pen in hand, for the "promesso eposo," who, though not shown in the picture, may be entering the room by the *portière* which an attendant is raising; but he is seen by the little bride elect, who waves a salute to him with the flower in her hand.

It is not surprising that a painting of this unusual character should give rise to doubt as to the correctness of its attribution, and it has been suggested that it is the work of Del Mazo, the pupil of Velasquez; but if that artist had been commissioned to paint the portrait of a knight of Santiago, his sitter would scarcely have been satisfied with the scanty indication of that celebrated order shown in this picture. If however, as I believe, the knight of Santiago represents Velasquez himself, the half-hidden cross of that order assumes an aspect that may have an important bearing on the questions of the authorship of the picture, the date of the work and the cause of its being

unfinished. Stirling Maxwell, in his admirable and exhaustive "Annals of the Artists of Spain," relates that Philip IV. in 1658 conferred on Velasquez the habit of the Order of Santiago; but it was not for many months later that the artist was invested with its insignia, owing to the formalities required by the Order to prove his pedigree. The king, impatient at this delay, sent for the President of the Order and the documents connected with the case, and having looked at them, His Majesty said to the President, "Place on record that the evidence satisfies me." The half-concealed red cross of Santiago in the picture was sufficient for Velasquez to show that he was entitled to the Order, but, with the modesty and conscientiousness that distinguished him, he did not design the insignia on his breast, where it is worn, apparently not feeling justified in so doing until after his investiture. This, however, did not occur till November 1659.

It is evident therefore that the picture must have been painted in 1658, after he had received the habit, but not the insignia, of the Order. That the picture was left unfinished was doubtless due to the onerous duties with which Velasquez was charged by the king in preparing the meeting on the Bidassoa in 1660 of the French and Spanish courts, to celebrate the nuptials of Louis XIV. and the Infanta Maria Teresa.

These duties doubled the official fatigues and shortened the life of Velasquez, who died shortly after his return to Madrid in August of the same year.

There is therefore good reason to believe that the picture in the National Gallery is the last ever painted by Velasquez.

THE CHICHESTER MARKET CROSS.

THE following report on the proposed restoration of the market cross in Chichester has been sent by the Society for the Protection of Ancient Buildings to the Town Council, and will be considered at to-day's meeting:—

9 Buckingham Street, Adelphi, W.C.

To the Worshipful the Mayor of Chichester.

Sir,—Upon returning here after meeting your committee on the 7th inst. I have reported to the committee of this Society the state in which I found the market cross. It was also with great pleasure that I informed my committee of the honour done to this Society by the courteous reception which I met with. I am now directed, by the committee of this Society to say that it is most anxious to give your committee every possible assistance, and in accordance with your requisition to make the following statement with regard to the treatment which it advises should be followed with respect to the market cross.

1. *Hoarding.*—That a close hoarding be erected all round the cross so that the covered cross may be used for materials, &c., and also to allow the work to progress without interruption.

2. *New Clock.*—That as soon as it is decided to carry out the work of repair, a good clockmaker be asked to furnish plans and estimate for providing a new clock, and that he be given clearly to understand that he must arrange his works so as to necessitate no further interference with stone or timber-work.

3. *Covering.*—That a temporary covering should be formed by felt or tarpaulin being placed over the backs of the flying buttresses.

4. *Roof.*—That the existing lead and boarding be removed, and the brick piers standing on the vaulting and now partly supporting the timbers should also be removed, and the timbers of the roof rearranged so that their bearing comes directly upon the central shaft at one end and the external enclosing wall at the other. That the external wall should be secured to the timbers by some such means as copper bolts and straps, so as to prevent any outward movement. Probably all the existing timbers (which appear sound) can be reused, but any new timbers required should be well-seasoned oak, free from sap and of English growth. Probably also the same boarding can be reused, but if not, new boarding of a similar description should be used. Oak boarding must not be used, as the tannin in it will decompose the metal.

5. *Flying Buttresses.*—That only one flying buttress should be dealt with at a time, and it should be carefully supported on temporary centreing, and then that all the existing ironwork should be removed and replaced in a similar manner with copper, care being taken that a better fixing is given to the lower end of the main strap, which in all probability would be better if taken lower down.

6. *Niches between Clock Dials.*—That the iron straps be removed from the backs of the four niches between clock dials and replaced with copper, unless some better form of tie can be devised. The pinnacle over the north-west niche it will probably be wise to temporarily remove.

7. *Iron Rods to Vanes.*—That if the iron rods to the vanes can be extracted from the finials without damage to the stone,

they should be replaced by copper rods, but rather than destroy the stonework it would be better that they should remain.

8. *New Roof Covering.*—That the roof be re-covered with stout copper or cast lead. If possible the sheets should not exceed 3 feet in width and 8 feet in length, and the lead should be cast not less than 9 lbs. to the square foot. Cast lead can be obtained from Rowe Brothers & Co., Canon's Marsh, Bristol.

9. *New Down Spout.*—That a new circular copper down spout may take the place of the existing down spout, and that it be provided with a plain square copper head.

10. *Stonework Generally.*—That every fine crack in the stonework which does not exceed an eighth of an inch in width should be carefully run full of liquid cement, care being taken to syringe out with clean water all foreign matter as far as possible. That where ornamental features have gone no attempt should be made to put imitative ornamental features in their place, but, on the other hand, that where ornamental features are loose they should be secured with fine copper bolts and cement, or other reasonable means which those entrusted with the work may be able to devise. Their instructions are that they should interfere with the present aspect of the cross as little as possible, and on the other hand that they should use all their skill and knowledge in protecting it from further decay. The committee is sorry that it cannot do more than speak in general terms of what repairs should be done, because it is of opinion that a just decision on each point can only be arrived at as the works proceed, but it suggests that where a stone has decayed to a considerable depth, say $1\frac{1}{2}$ inches to 2 inches, it may be advisable to cut the surface of such a stone back sufficiently far to get at the unaffected stone, and that then having thoroughly wetted the surface the stone should be made out to the original face with a plaster composed of blue lias lime and sharp coarse-washed sand in the proportion of three of sand and one of lime.

11. *Bell fêche.*—With regard to the central bell fêche the committee would urge most strongly the importance of not altering it. In its opinion the design is good, but whether good or bad it would still urge its retention, for time has toned it down in harmony with the rest of the work, and any new work could not acquire similar quality in our lifetime. Moreover, to alter any portion of the cross as it now stands would only court disagreement as to the form which the new work should take. Again, whether it is intended to use the bell for the clock to strike upon or not, the committee would still urge the retention of the bell in its present position, inasmuch as it helps to explain why the finial of the cross was designed in this form, and if it were removed too much light would show through the openings.—I am, sir, your obedient servant,

THACKERAY TURNER, Secretary.

May 10, 1895.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of this Association made an excursion to Paisley on Saturday, for the purpose of visiting the old abbey and the Coats Memorial Church. They arrived in Paisley shortly after two o'clock. Their first visit was to the abbey, and they were there received and welcomed by the Rev. Dr. Gentles. The party at once entered the church, where Mr. Hippolyte Blanc, Edinburgh, read an interesting paper on the abbey. He devoted the first portion of his paper to the historical incidents connected with the old building. These he dealt with in an interesting and instructive manner, making special allusion to the founding of the abbey in 1163, to the favours conferred on it by the Stuarts and others, and to the position the Paisley church occupied in the old ecclesiastical affairs of Scotland. Then he considered the attraction and the beauty of the venerable edifice as centred in its architecture. As he proceeded with his observations he directed attention to the special features with which he was dealing, and pointed out the architectural beauty still manifest in various parts of the church. He also traced, with the assistance of a plan, the extent of the original buildings, and expressed the hope that the time was not far distant when the abbey would be restored in a manner in keeping with its old stately grandeur. The company afterwards visited various places of interest attached to the abbey, such as the ruins of the altar, the choir, &c.; St. Mirin's chapel, or "sounding aisle," which contains the tomb of the Princess Marjory, the daughter of the great Bruce, and the mother of the first of the Royal Stuarts. A visit was also made to the memorial erected by Her Majesty the Queen (following her visit to Paisley in 1888) to the memory of the members of the royal house of Stewart who are buried in the Paisley Abbey. The memorial is placed in front of the ruins of the altar. Before leaving the abbey grounds a vote of thanks was, on the motion of Mr. Blanc, accorded Mr. Gentles for his kindness in receiving the deputation that afternoon. The party afterwards made their way to the Coats Memorial

Church in the High Street. In one of the ante-rooms attached to the large church hall Mr. Blanc had the ground plans and elevations of the general building arranged. From these he explained the principal features of the work represented in the entire undertaking. Whilst pointing out the elaborate and intricate nature of the work in connection with the spire, he took occasion to pay a high compliment to Mr. Alexander Scott, the clerk of works on the buildings, for the thorough and efficient manner in which he had attended to the general operations. An imperfect stone or one carelessly placed might have seriously affected the lantern or crown of the spire, but this had been carefully guarded against by Mr. Scott, and he (Mr. Blanc) was glad of the opportunity to make that statement. Mr. Blanc next led the company through the several passages and rooms of the building, and then took them into the interior of the church. At some length he explained the arrangements adopted for the chancel or choir recess. In this connection he stated that the primary conditions to be observed were to have the building and the chancel or choir recess, of course, in harmony with the worship of the Baptist denomination. These conditions, he believed, had been carefully observed, and he thought he might say so, even in face of the carping criticism of a member of the Ecclesiological Association of Glasgow. The company afterwards ascended the spire, which rises to a height of about 200 feet, and from one of the balconies they had a splendid view of Paisley and the surrounding country. At the close of the inspection of the memorial church, Mr. James Bruce proposed a hearty vote of thanks to Mr. Blanc. As their leader and guide for the day, he said, Mr. Blanc had provided them with a splendid intellectual treat. In the old Abbey of Paisley he had brought before them the beautiful architecture of a bygone day, and now he had made them familiar with the architectural features of one of the finest modern ecclesiastical buildings in the country. As its architect Mr. Blanc had in the Coats Memorial Church produced a splendid building. But this was only what had been expected from him, considering the culture of his mind, his familiarity with the great types of continental architecture and the reverential and devout spirit he brought to bear on all his work which was to be devoted to the service of God. Mr. Blanc suitably acknowledged the vote of thanks accorded him, and the company left Paisley for Edinburgh shortly after six o'clock.

SHETLAND PLACE-NAMES

A LECTURE on the old Shetland place-names was delivered last week at Lerwick by Mr. Jakob Jakobsen, of the University of Copenhagen, who has been in Shetland for nearly two years gathering the remains of the old Norse language, with the view of preparing an etymological dictionary of the same. The lecturer remarked that the first thing that struck one about the Shetland place-names was their great abundance. No matter how small a patch of ground it was it had its distinctive name. The small island of Fetlar alone contains no fewer than 2,000 place-names. The great majority of these names were derived from the Norn or ancient Norwegian language. While the old Norn speech gradually gave way before Scots and English, and the old conversational terms became supplanted by new, the place-names maintained their ground. The reasons for this, Mr. Jakobsen remarked, were not difficult to find. Place-names are not so liable to change as conversational words. One particular name through time sticks to one particular spot, so the connection between a name and the place it represents is far closer than the connection between a conversational word and the article it represents, as the word is applied to any article of that particular kind. No old Shetland place-names, it was remarked, can be traced to any other language than the Norn; but still it is possible, through a study of the Norn place-names, to get a peep at an earlier period. They found the settlements of the ancient Irish missionaries, the papal popes or culdees, recorded in such names as Papa Stour and Papil. Mr. Jakobsen, in this connection, entered into an interesting discussion as to whether the people amongst whom these early missionaries laboured were really Picts, of whom there are many myths lingering in Shetland. In the course of his researches he had come across several place-names, regarding which, as bearing on the debatable question of a Pictish occupation, scholars will be much interested. The lecturer went on to speak of the times of the Finns and the Trows, giving instances where the names of these occur. Afterwards he turned to the more common kinds of place-names, beginning with the class which is by far the most comprehensive—that is, the one containing places named according to the form of the land. Most of the Shetland place-names contain in themselves a description of the places they are applied to. This class the lecturer divided into subdivisions, taking first the various kinds of inland heights, hills, braes and hillocks; then the level ground, and the various kinds of valleys, glens and hollows; then the formations of the

shore; then the various indentations of the sea, and finally, the small islands and rocks in the sea along the coast. All these various names were detailed and explained, the lecturer concluding with an examination of the name Zetland, the derivation of which is very doubtful.

A MEGALITHIC VILLAGE IN ALGERIA.

IN his new report on Algeria Sir Lambert Playfair describes a visit which he made to the phosphate mines of Djebel Dyr, near Tebessa, in the course of which he says he saw a wonderful megalithic village. At about a kilometre from the house of the manager of the mines the mine tramway runs along the base of a cliff of shell limestone about 240 feet high. Below is a grassy slope covered with stones and boulders which have been detached from the hill above. Some of them are of great size, being 11 or 12 mètres in circumference, and they have been hollowed out into chambers about 2 mètres square at the base. A ledge of 30 centimètres square has been left on all the four sides, and the centre has been further excavated to a depth of about 10 centimètres. Windows have been cut in the sides, and one can clearly see the groove into which a door was fitted. The interior height of the chambers is about 2 mètres. The boulders are of shell limestone not very difficult to cut, but still so hard that the pick marks in the inside are as sharp as when first made. On the summit of the hill above are megalithic tombs of the ordinary type, large slabs supported by upright stones. Sir Lambert cannot quite make up his mind whether these excavated boulders are habitations or tombs like the others. The fact that undoubted tombs exist in the immediate vicinity at what would naturally be considered the proper distance for the cemetery of a village induces the belief that the boulders may be habitations. They are provided with windows, and the groove for the door only exists to half its height, leaving the upper half of the aperture to be shut by a curtain or hanging of some kind. Some of the windows are rudely made; one was a nearly perfect ellipse placed high up in the wall so as to serve also for a chimney. The interior dimensions are not much less than many of the native huts at the present day. The balance of evidence appears to him in favour of their having been intended as habitations.

DUNDEE INSTITUTE OF ARCHITECTURE.

A MEETING of the Dundee Institute of Architecture, Science and Art was held at the Albert Institute on Monday night. Ex-Bailie Keith, the president, occupied the chair. The result of the drawing competitions of the Institute were announced. For perspective sketch of an architectural subject there was only one entry, by Mr. James Williamson, County Buildings, Cupar Fife, who showed a fairly good drawing of a gate lodge. In the class for measured drawings there were four competitors. Mr. Charles Soutar, 104 Commercial Street, was first with a firmly set and carefully manipulated drawing of Dairsie Church. The second place was taken by Mr. Andrew Hutton, 16 Annfield Street, his subject being the Girls' High School, Dundee. Mr. Hutton did not show the same firmness in his work as Mr. Soutar, but he exhibited a considerable amount of refinement in details. For perspective sketch in pencil of a memorial tomb in a church there were two entrants, and both chose the same subject—Bishop Forbes's tomb in St. Paul's Episcopal Church, Dundee. The prize was awarded to Mr. W. B. Black, 12 Hawkhill, for a capital piece of work. Mr. D. P. Grubb, 5 Osborne Place, was easily first in the water-colour sketch class with a painting of *Leuchars Church*. The picture shows much artistic merit and considerable latent power, its only weakness perhaps being that it was rather delicate in colouring. Honorariums were awarded to Mr. John Gray, 4 Baxter Park Terrace, for his *Landscape*, and to Mr. Alexander Malcolm, 6 Forfar Road, for *On the Eden*, both meritorious pictures. There were two competitors for the best sketch from an antique subject in the Dundee Art Museum of Casts. The prize was awarded to Miss Bella Fraser, 9 Ward Road, her subject being *The Slave*. The other competitor, Mr. Allan Inglis, 26 Isles's Lane, exhibited a drawing of the figure of *Bacchante*, which, though more firmly drawn than *The Slave*, lacked the winning picture's softness and roundness. The judges of the competition were Provost Orchar, Broughty Ferry, Mr. A. C. Lamb and Mr. T. S. Robertson. The drawings will be on exhibition in the South Kensington Room during this week. The Institute afterwards nominated the Council for the ensuing session as follows:—President, ex-Bailie Keith; vice-president, Mr. Leslie Ower; members of Council, Messrs. James Foggie, T. M. Cappon, W. Nixon, John Macfarlane; hon. secretary and treasurer and librarian, Mr. J. J. Henderson; auditors, Messrs. James Hutton and Frank Salmond. Mr. Robert Little, architect, Kirkcaldy, was elected a member of the Institute.

THE VENICE EXHIBITION.

IT is stated by a correspondent of the *Scotsman* that the whole number of pictures admitted into the Art Exhibition is 500. These have been drawn from the studios of the leading artists of every nation in Europe, and they have been arranged in the exhibition rooms according to the nationalities of the artists. There are ten rooms in all, each nation having as a rule one, although Italy, having about 200 pictures out of the 500, has more, whilst France and Spain, having sent comparatively few pictures, have but one between them. The atrium is devoted to sculpture, and the very first room opening off it is the English one. A pleasing and instructive feature of the exhibition is the contrast the different art-schools of Europe here brought together present. Whilst the pictures may be equally meritorious, the difference in subject, conception and execution is very striking. Every school has thus its own peculiar interests. The Italian pictures suggest rapid and easy execution, in contrast to the English ones, which speak of thought and labour. The Norwegian are like Japanese in their quaint outlines and colourings, whilst there is a brilliant dash about the French and Spanish, but something not altogether pleasing in them. The subjects of the pictures are suggestive of the countries of the authors, and of the habits and customs and modes of thought of their respective peoples. These characteristics are so marked that if one found an English-looking picture in an Italian room, or an Italian-looking one in the Greek room, one was safe in saying the Italian artist had been trained in England or in Greece. A few of the pictures that attracted particular notice were the following:—*La Calma*, a lake above Belluno, amongst the wild dolomites, by Millo Bartoluzzi; *Return to His Native Country*, by Giovanni Sgantini, a young artist who was early left an orphan, and who began his life's work by drawing on stones whilst herding cattle in the fields; *Giorno di Magra*, a picture of the Piazza of Santa Margherita in Venice on Friday, when the fish market is in full swing; *Parabola*, by Cesare Laurente, which shows two houses with outside stairs and a terrace—up the one stair a youthful party go with gaiety and laughter, whilst the same figures, sobered with age, are seen descending the other one. An artist who lives "far from the madding crowd" in the Abruzzi mountains has painted with much strength a legend of his country, called *The Daughter of Iorio*. Domenico Morelli, an Italian senator, has two portraits and a *Temptation in the Wilderness*. Two pleasing pictures by Pietro Fragiaco are *Un Saluto*, which shows two boats saluting each other on the open sea, and *Tristezza* (sadness), which shows a mountain hamlet and a disconsolate maiden by the wayside. *Hammer-smith*, an *Autumn Evening* and *The Madonna with Angels*, by Aristide Sartorio, were much admired. They had an English look about them, and the artist was trained in England. His conception of the Madonna contrasts with those of Italian artists. The Spanish artist José Villegas is represented by a large canvas, *The Coronation of the Dogress Foscari*. The pictures of the German artists Max Liebermann and Ludwig Deltman, *The Market of Haarlem*, *The Labour*, the *Arrival of Humbert I. at Berlin*, created much interest and remark. Of the pictures in the English room much admiration was expressed. Millais's *Last Rose of Summer*, Holman Hunt's *May Day Morning on Magdalen Tower*, Oulless's *Portrait of G. H. Pember* excited much enthusiasm. King Humbert bought pictures to the value of 50,000 francs (2,000*l.*).

THE NATIONAL TRUST.

THE first annual meeting of the National Trust for Places of Historic Interest or National Beauty was held on the 9th inst. at the Examination Hall, Savoy, under the presidency of the Duke of Westminster. The report showed that the Society has already done some practical work. It has become the recipient of a picturesque cliff overlooking Barmouth, which has been presented to the nation by Mrs. Fanny Talbot. With reference to Carlyle's house at Chelsea the provisional council of the Trust has issued an appeal to its members for help, recognising that the work of the Carlyle's house preservation committee was cognate with its own. Efforts were being made to secure Alfriston Old Clergy House, near Eastbourne, Roman remains at Bognor, on the South Downs; the Fall of Foyers, in Inverness-shire; and the site of Bute House, Petersham. It was the intention of the council to prepare a schedule of places requiring preservation, and it would be glad if members would assist the work by forwarding the particulars of any places they might meet with which they considered should be preserved for the nation.

The Chairman having referred to the enthusiastic meeting at Grosvenor House when the Trust was formed, remarked he had little to say on that occasion, as they had hardly got into harness. But he thought it must be satisfactory to know that

an excellent start had been made with the cliff at Barmouth and the old Clergy House, which he supposed was one of the oldest timber houses in the country. It must not go out to the public that they did not want funds, which were, in fact, needed for the repair of the places held by the Trust. It might be possible to purchase, but there was this risk, that if they gave out they were a purchasing society it might lead to misunderstanding. At any rate it would have to be done with discretion and tact. He moved the adoption of the report.

Sir Robert Hunter seconded the resolution, and pointed out that as far back as 1865 the existence of such a Trust would have been invaluable to the nation. At that time the Lord of the Manor of Banstead was anxious to make over the Downs to the public. There being no authority then to accept that open space it was eventually closed. That led to expensive litigation before the Downs were again thrown open to the public. He gave an account of a kindred society which exists in Massachusetts, and through which several picturesque open spaces had been secured to the public.

The report having been adopted, Miss Octavia Hill moved a vote of thanks to the donor of the cliff.

GENERAL.

A Deputation from the Society of Antiquaries of Scotland visited Annandale a few days ago to inspect what are represented as Roman camps. The visit was with a view to advising the Council of the Society whether to proceed with excavations at these reputed Roman camps. Birrens camp, which is represented to have been the winter quarters of the Romans, and where there are distinctly-marked ramparts and fosses, was first inspected, and the party then drove to Burnswark Hill, upon the slopes of which are distinctly seen two large and two small camps.

The Exhibition of the Glasgow Institute of Fine Arts closed on Monday evening with a promenade concert.

Mr. Francis Taylor, late of Howe, who has just died at Kirkwall, has left the residue of his estate, amounting to about 1,000*l.*, to be expended on the repair of St. Magnus Cathedral.

An International Exhibition or World's Fair was opened at Amsterdam on Saturday by the Grand Master of the Ceremonies, who was deputed to act in the absence of the two Queens.

The Plans prepared by Mr. Robertson, of the Office of Works, Edinburgh, for the new Post Office in Dundee, have been sanctioned.

Mr. H. G. Quartermain will read a paper on "Sussex Churches" before the Society of Architects on Tuesday next. We hear that the author proposes to deal in considerable detail with the remarkable churches at Old and New Shoreham, and the famous Saxon church at Worth. Limelight views will illustrate and accentuate the interest of the subject.

Mr. Ernest Hart, D.C.L., will deliver on Tuesday, the 21st inst., at the Society of Arts, the first of his series of Cantor Lectures, on "Japanese Art Industries."

The Finance Committee of the Liverpool Corporation have advised the grant of land and money to the amount of 15,000*l.* to the Northern Hospital committee, so as to provide an adequate site for the rebuilding of the hospital on an enlarged scale.

Mr. Waterhouse, R.A., as treasurer of the Artists' Benevolent Institution, announced at the dinner on Saturday that Mr. J. S. Montefiore had offered a house on the East Cliff, Ramsgate, as a temporary home for distressed artists. The subscriptions and donations for the year amounted to 2,427*l.* 10*s.* 6*d.*

A Market Cross is about to be erected in Arundel on the site of the existing town pump.

A Lecture on "The Early Renaissance in England" will be delivered in Cambridge on June 13 by the Bishop of Peterborough, who is Sir Robert Redes lecturer for the present year.

Mr. Arthur Baker, F.R.I.B.A., of the firm of Messrs. Baker & Turrill, of Effingham House, Arundel Street, Strand, and Mr. Richard P. Day, A.R.I.B.A., of 20 John Street, Adelphi, have been appointed surveyors of dilapidations in and for the diocese of London, in accordance with the Ecclesiastical Dilapidations Act of 1871, to fill the vacancy caused by the recent death of Mr. Gordon M. Hills, who held the appointment as sole surveyor for the diocese since 1871.

The Designs submitted by Mr. George Baines, 4 Great Winchester Street, London, E.C., have been selected in the open competition for a ladies' college in North London, and he has been instructed to obtain tenders forthwith. Accommodation is provided for seventy resident pupils, with dining-hall and principal's house.

The Architect.

THE WEEK.

THE buildings which are most interesting from a lawyer's point of view are those which are of a nondescript or a dual character. A case relating to one was before the Lord Chief Justice and Mr. Justice CHARLES on Monday. The owner of a private school at Lindfield, in Sussex, proposed to erect a sanatorium, and he duly advised the Cuckfield Union Sanitary Authority of his intention. The plan showed a building with walls of galvanised iron lined with wood, an iron roof, wood floors with concrete under them and brick foundations. The Authority declined to sanction the erection, whereupon the schoolmaster commenced operations. He employed sheets of corrugated galvanised iron, one thirty-second of an inch in thickness, with a layer of felt inside three-sixteenths of an inch in thickness, fixed to the outside of a framework of wooden uprights and horizontal posts and rails, the sheets being fixed to each other where they join by rivets or other metal fastenings. To the inside of the framework was fixed a lining of matchboarding five-eighths of an inch in thickness, and separated from the felt lining by a hollow space of $4\frac{1}{2}$ inches, being the thickness of the posts and rails. The Authority ordered the structure to be taken down, but as the order was not obeyed men were employed to do so, when the owner commenced legal proceedings. It was agreed to allow the sanatorium to remain until the Court decided whether under the by-law such a structure was prohibited, and, if so, whether the by-law was unreasonable. The by-law relied on by the Authority enacts that "every person who shall erect a new building shall cause such building to be enclosed with walls constructed of good bricks, stone or other hard and incombustible materials, solidly put together with good mortar (compounded with good lime and clean sharp sand or other suitable material, or with good cement, or with good cement mixed with clean sharp sand)."

ON Wednesday, judgment was given by the Lord Chief Justice. His lordship said it was remarkable that in the by-laws there was no reference to iron buildings, although they were to be found throughout the country. The by-law on which the Sanitary Authority relied in the present case related to walls of bricks, stone, or other hard incombustible materials. Under some circumstances, iron would come under the latter designation; but the question was whether the wall in question was so constructed. His lordship said he did not propose to give an exact definition of a wall, but he took a wall to be something which would stand by itself. A piece of corrugated iron, one thirty-second part of an inch thick, would not stand that test, and therefore could not be considered a wall. As the framework was of wood, it could not be considered as a hard and incombustible material. There was also a match-board lining. His lordship said therefore he must hold that the work did not form a wall composed of brick, stone, or other incombustible material, and could not be permitted to stand. There was an offence against the by-law, and judgment must be entered for the Cuckfield District Council with costs. The counsel for the owner of the sanatorium asked whether, if the wooden posts were removed and iron substituted, the structure might stand, but the Lord Chief Justice said they had answered one conundrum and declined to undertake another.

A RETURN has been issued of the London churches pulled down or condemned under the Union of Benefices Act, 1860. St. Matthew, Friday Street, is the first. The site realised 22,005*l.*, including 320*l.* for the sale of materials and fittings. Out of the proceeds a sum of 7,420*l.* 17*s.* was expended on the church of St. Thomas, Finsbury. The remainder was spent on endowment, expenses at St. Vedast's, &c. The site and materials of St. Thomas in the Liberty of the Rolls brought 7,102*l.* 16*s.* 6*d.*, and out of the money a sum of 2,713*l.* 5*s.* 6*d.* was appro-

priated to St. Thomas, Kensal Town. St. Olave, Old Jewry, sold for 22,400*l.*, of which sum 11,000*l.* was expended on St. Olave, Stoke Newington. The price obtained for St. Mary Magdalen, Old Fish Street, was 12,700*l.* An Order in Council has directed that 462*l.* be applied to reseating St. Martin, Ludgate Hill, 7,000*l.* for a parsonage house, 6,800*l.* as a fabric fund for St. Martin's, and 6,000*l.* for building a new church. The difference will be paid out of sums received in respect of insurances on the church, which was destroyed by fire. The church of All Hallows the Great, Upper Thames Street, was lately sold for 13,129*l.* 16*s.* The amount to be expended on All Hallows, North St. Pancras, is not yet settled. In addition, 1,000*l.* will be applied towards repairs at St. Michael Royal, and 4,000*l.* towards the cost of a new parsonage. The churches of St. Matthew, Pell Street, and Holy Trinity, Minories, are to be used as Sunday schools; St. Jude, Upper Chelsea, will be a chapel of ease. The removal of human remains and the reinterment have been costly, viz. St. Matthew, Friday Street, 1,179*l.* 7*s.* 10*d.*; St. Olave, Old Jewry, 2,974*l.* 18*s.* 10*d.*; St. Mary Magdalen, Old Fish Street, 2,094*l.* 11*s.* 4*d.*; All Hallows the Great, Upper Thames Street, 1,140*l.* 10*s.* 8*d.*

THE annual meeting of the Sussex Archaeological Society will be held in Eastbourne on July 25 and 26. It is proposed that on the first day the district east of the town should be visited, and the western district on the second day. In that way Westham Church, Pevensey Castle and Church, Herstmonceux Castle and Church, Hailsham, Willingdon, the buildings in Eastbourne (including the parish church, on the pillars of which some interesting fish-markings have been recently discovered), Eastdean, Alfriston, Mitcham, Arlington, Hailsham and Polegate could be seen by the members. A general committee and an executive committee have been appointed to make arrangements for the meeting. As several years have elapsed since the Society met in Eastbourne, old as well as new members will see something novel in the excursions.

THE art unions in this country are based on the principle that individual interests must be supreme. It is a lottery in which every subscriber is sure of something, while a few gain more expensive prizes. The German art unions have a different object in view, which is the encouragement of forms of art which otherwise might be neglected. The Westphalian and Rhineland Union's latest proceedings exemplify what we mean. One-half the cost of a large historical painting in the town-hall of Bochum has been contributed by the Union. The prizes given in the competition for the work also came out of the treasury of the Union. A sum of 10,000 marks has been set aside for the decoration of the ancient church of the Virgin, in Trier, and 3,500 marks will also be given to obtain an altar-piece for an evangelical church at Saargemünd, for in Germany there is not a fear of art among Lutherans. If similar undertakings were supported in this country, the judges would be less doubtful about the legality of art unions and their liability to prosecution.

THE utilising of waste materials in buildings is not always safe. According to the report of the Chief Inspector on Alkali Works in Scotland, one fatal accident has occurred at an alkali work at Irvine owing to the use of tank-waste as a foundation or flooring, over which had been erected tanks for the condensation and storage of muriatic acid. This material consolidates into a hard mass, and is not unfrequently used in alkali works for filling up hollow places and making good the ground level. It is hoped that the use of this material will be avoided in future in places where it is possible that acid liquors may come in contact with it. In the Irvine case a bricklayer, having to effect some repairs to pipes connected with the acid tanks, was overcome by a rush of sulphuretted hydrogen gas caused by an overflow of the muriatic acid on to the bed of tank-waste below. The bricklayer fell to the ground insensible and could not be restored.

PARIS AND LONDON.

WHENEVER a foreign celebrity appears among us he is expected to formulate a theory about JOHN BULL and his island. At one time the terror of the Channel was enough to restrict the number of such visitors. Improved navigation and other advantages now make them indifferent to the voyage. But when theories have in consequence become rather abundant, every day makes it more difficult to produce one about England that will be startling. M. ALPHONSE DAUDET is an example. CHARLES DICKENS, when he visited Niagara, knowing that he could not say anything novel about the effect of the mass of waters on the eye or the ear, accordingly surprised people by announcing that before it one was hushed into perfect peace by the stillness. The author of "Fromont Jeune et Risler Aîné," who is an enthusiastic admirer of DICKENS, appears to have utilised his recollection of the idea, for he has announced that what impressed him most strongly during his visit to London was the silence—the disquieting silence of the millions of taciturn automata who appeared to be passing along the streets like the figures in a dream. Ordinary visitors and residents would not consider that London is a silent city, any more than at Niagara water falls for 160 feet as quietly as it appears to do in a picture. We must, however, allow men of genius to record their sensations, although they may appear peculiar.

London has surprised M. DAUDET by other qualities besides its aphony. There is, he says, too much abundance manifest, and what is worse the abundance is senseless. Our memorials are too numerous. They appear to him as toys scattered at hazard over a plan. There are towers upon towers, statues and pedestals and palaces and colonnades and cupolas and belfries, but they are all out of scale and are not imposing. M. DAUDET's disappointment may, however, be caused by a trick on the part of his guide. When THACKERAY escorted the genial JULES JANIN through London, he introduced all the public statues to him as memorials of WELLINGTON. M. DAUDET is eager to see his countrymen ruled by another NAPOLEON, and who knows whether some wag did not imitate THACKERAY's example. Moreover, in all his travels M. DAUDET could discover nothing to correspond with the Quais of Paris, with the Louvre, or with the Champs-Élysées.

It would be vain to deny that London is not comparable with Paris in offering the combinations of architecture with which a stranger is most impressed. There are no people who are more skilful in the art of making the most of things than M. DAUDET's countrymen. French cooks are amazed at the unworthy results which are produced by such an abundance of viands as they see in London. French journalists are no less struck by the dulness of English newspapers, in which a line may be devoted to a subject that could be so easily utilised for a page, and French municipal councillors have reason to be amazed at the insignificant effects which are produced by an enormous expenditure in rates. The French are economists of time, of money, of space and of materials. In England there is an extravagance in all which the least observant stranger cannot pass over.

As regards the absence of the picturesque effects in cities and towns which are seen abroad, it arises directly or indirectly from our constitutional character. Although co-operation flourishes in England in commercial transactions, it has little power in anything relating to the amenity of streets. The principle itself is unknown among us. On that account we have often thought that to a foreigner there is nothing in Mr. RUSKIN's books which would appear more puzzling than what he says about the effect of "accumulation." Buy pictures and prints, he says, and they are without any collateral effect; they cannot be shown with advantage side by side. But introduce some sculpture on the outside of your house, and let your neighbour do likewise; the two houses will then have an improved appearance, which will be enhanced if three or more houses have also their bits of sculpture, and still more so if the street or the city will combine in the common enjoyment. To a foreigner of average education it would be unnecessary to explain the advantage of that sort of union; he would by instinct feel he was to be a gainer. Unhappily in England Mr. RUSKIN's lesson has yet to be comprehended.

But still less convinced are people about the desirability of laying out streets in a way that brings credit on a town or a district. A project for the simplest street improvement creates a host of opponents. Few people believe that it is not in reality a "job," and only by the exercise of vigorous authority can it be realised. Individual interests are paramount in England, and as long as it is supposed Magna Charta imparts sacredness to every domicile we cannot expect that the vistas which are presented in many parts of Paris can be easily imitated.

It is well also to remember that in Paris the fine architectural effects in the streets, which are so identified with the city as to appear as if they were ordained from the beginning in the nature of things, are of modern origin. M. DAUDET refers to the proportions of the Louvre, but he is old enough to have seen the palace in what might be considered as an embryo state. It was reserved for NAPOLEON III. to perform a feat which all his predecessors from the time of LOUIS XIV. had failed in. A less despotic ruler would have hesitated before realising VISCONTI's plans, and thus bringing the palace into a completed state. Prior to the comparatively recent time when the Rue de Rivoli was carried through its full length, the Louvre was not displayed in a manner becoming its importance, because, as we have said, street effects were not sufficiently valued by authorities or by citizens. That fine building, the Luxembourg Palace, has not yet become the central point which it deserves to be; what is probably the strongest part cannot be properly seen owing to the extreme narrowness of the street on which it abuts. The Champs-Élysées owes much of its beauty to its serving as a suitable approach to CHALGRIN's noble Arc de l'Etoile. But that structure was not completed until 1836, and at an earlier time the view was imperfect. In fact, if the buildings and arrangements which were carried out in the present century could be cleared away and Paris restored to its former appearance, it would not be a very charming capital according to modern notions. Among the works which are to be credited to the nineteenth century are the Madeleine, the façade of the Chambre, which is in keeping with the church, the Bourse, the Palais de Justice, the Vendôme Column, the Column of July, the Place de la Concorde with its obelisk from Luxor, the majority of the great fountains, churches like St. Vincent de Paul and St. Clothilde, not to speak of the numerous structures which have been executed within the last half century, and which are so remarkable as to have transformed Paris. There are still some of the inhabitants, as well as foreigners, who regret the changes, and prefer the Paris of a time prior to 1848, which was to them what the Paris of the sixteenth century was to MONTAIGNE, a place in which something was found in keeping with their individuality, and corresponding with a time in which science had not gained supremacy over art and literature. But the Paris which is traversed by long and straight thoroughfares like the lines of triangulation on a geodetical survey, with "places" or noble buildings as the important points which are determined and connected, which can still claim to be what GOETHE called it, the "geistiger Centralpunkt" of an intellectual world, the Paris of which writers of M. DAUDET's character are enamoured is a modern creation, and it owes its existence to despotism in one form or another.

M. DAUDET therefore comes from a place which has been so much changed during his own life it may be considered as a new city. In London he finds himself in the most conservative of cities. Buildings are altered, but the principal streets continue to present the lines on which they were originally laid out. To a man of his habits it is like passing from light to darkness. The parts of Paris with which he is best acquainted are not to be matched in London. It is natural he should make the most of the contrast, and assume for the occasion the rôle of the representative of Paris if not of France. But it would be well for him to remember that many thousands of the inhabitants of Paris visit London every year who are not startled by the differences between the two capitals. They belong to the class of merchants and manufacturers, the men of business, and as the creators of wealth they are not without importance. They gain their riches in Paris streets which bear no resemblance to the alleys of the Champs-Élysées.

and in quarters which do not recall the very delicate and artistic pearl to which M. DAUDET likens Paris. Those men are disposed to envy their London friends for dwelling in houses that are cleaner and safer, and in streets that are less dismal than those of Paris, in which their own lives are spent. It is well to hear lovers of the ideal rhapsodise about whatever comes near their aspirations; but even despotism cannot make more than one Louvre or one Champs-Élysées in Paris, and it is astonishing how many public buildings there are in that city which would bear enlargement and elevation to the scale which M. DAUDET has recommended for London.

THE OLD FLEET PRISON.

"WITHOUT Ludgate," wrote John Stow in his incomparable "Survey of London," "on the right hand, or the north side from the said gate, lieth the Old Bayly, as I said, then the high street called Ludgate Hill down to Fleet Lane, in which standeth the Fleet, a prison house so called of the Fleet or water running by it, and sometime about it, but

"At the front," says this writer, "is a narrow court. At each end of the building there is a small projection or wing. There are four floors—they call them galleries—besides the cellar floor called 'Bartholomew's Fair.' Each gallery consists of a passage in the middle, of the whole length of the prison, 66 yards; and rooms on each side of about $14\frac{1}{2}$ feet by $12\frac{1}{2}$, and $9\frac{1}{2}$ feet high; a chimney and window in every room. The passages are narrow (not 7 feet wide) and darkish, having only a window at each end. On the first floor, the hall gallery, to which you ascend by eight steps, are a chapel, a tap-room, a coffee-room (made of two rooms for debtors), a room for the turnkey, another for the watchman, and eighteen rooms for prisoners. Besides the coffee-room and tap-room, two of these eighteen rooms and all the cellar floor, except a lock-up room to confine the disorderly and another for the turnkey, were held by the tapster, John Cartwright, who bought the remainder of the lease at public auction in 1775. The cellar floor is sixteen steps below the hall gallery. It consists of the two rooms just mentioned, the tapster's kitchen, his four large beer and wine cellars, and fifteen rooms for prisoners. These fifteen, and the two before mentioned on the hall gallery, the tapster lets to prisoners for

THE OLD FLEET PRISON.

now vaulted over." Stow's "Survey" is dated 1598, and, according to the honest old chronicler, the Fleet antedates Richard I. It has been proved to have been a debtors' prison as early as 1290. The most recent of the buildings forming the Fleet prison were finally demolished in 1846; its site is now occupied by a well-known memorial hall after "the Gothick manner." In the year 1780 the prison was burned down by the Gordon rioters, but immediately rebuilt on the old plan. The fine old print by Rowlandson and Pugin, dated 1808, which we reproduce to-day, shows the court and façade of the building as reconstructed. What the general arrangement of the place was we may gather from the writings of Howard, the philanthropist, who visited the Fleet, April 1774, and five years afterwards, in his "State of the Prisons of England and Wales," speaks of the Fleet as clean and free from offensive odours.

from 4s. to 8s. per week. On the second floor (that next above the hall gallery) are twenty-five rooms for prisoners; on the next gallery twenty-seven. One of these, fronting the staircase, is their committee-room. A room at one end is an infirmary; at the other end is a dirty billiard-table, kept by the prisoner who sleeps in that room. On the highest storey are twenty-seven bedrooms."

It would appear from this description of Howard that all the rooms above described were for "Master Side" debtors, the "Common Side" debtors occupying apartments in the right wing of building.

In Noorthouck's "New History of London," dated 1773, we find it stated that the Fleet was "very large and was reckoned the best prison in the City for accommodation; but the buildings within being old, part of them lately fell down."

In 1726, the farming of the prison having become intolerably corrupt, a Parliamentary inquiry took place, and Huggins, the hen farmer, and Bambridge, his lessee, were tried for murder. Definite reforms were brought about by the action of a body of benevolent gentlemen who, in 1729, formed themselves into a committee to search into the horrors of the gloomy prison.

Noorthouck, above referred to, says:—"All sorts of games and diversions are carried on in a large open area, enclosed with a high wall." In the print we thus see the prisoners engaged.

It was not, however, primarily to recall the old memories of the Fleet, whether relating to its history, its crimes, marriages, or worthies connected with the building—among whom Mr. Pickwick must not be forgotten—that the reproduction of the old drawing of Rowlandson and Pugin is put before the reader. The print has been lent by Mr. James Brooks, who points out that a drawing of a building made nearly a century ago shows what looks uncommonly like a ventilated soil-pipe running up the wall. If not a soil-pipe it is hard to say what the feature as drawn represents, and if a soil-pipe, and moreover a ventilated soil-pipe, it is certainly remarkable. Howard, we have seen, speaks of the Fleet as "clean and free from offensive odours." It must be something more than a coincidence that a building of this nature should be pronounced wholesome at the latter end of the eighteenth century, and that a drawing of the same or practically the same structure, made comparatively but a few years later and by a skilled architectural draughtsman, should show ventilation on so-called modern principles. No great amount of imagination is required to distinguish a wire "balloon" duly provided and fixed at the end of the pipe. Moreover, there is on the left of the façade, as shown in the drawing, what may reasonably be taken to represent a similar pipe, only one not so clearly shown, running over the parapet and up the chimney-stack.

We are forcibly reminded of the saying that "there is nothing new under the sun." Our modern sanitary engineers may claim the ventilated "S. P." as their own; but it is probable that—as in the case of the modern craze for sloping backs to fireplaces, the advantages of which were pointed out years ago by Count Rumford—it is the fruit of the labours of older men at times when thought was deeper if more slow, and when there was less hastening to the Patent Office.

R. OWEN ALLSOP.

ARCHITECTURAL ASSOCIATION SOIREE.

THE annual soirée of the Association was held on Thursday evening, the 16th inst., at the headquarters of the London Scottish Rifle Volunteers, James Street, Buckingham Gate.

There was a full attendance of members, the large hall being filled. For stage purposes the lights in the hall were not turned on, and the illumination from the stage did not afford a proper sight of those who formed the audience.

The first part of the evening's proceedings was devoted to a variety entertainment, excellently carried out by professional ladies and gentlemen who were present by kind permission of their respective managers.

Mr. George Robey won applause for his sketch in character, as also did Mr. F. Baring Ranalow for his song, and Miss Ray Maskell acquitted herself well in a dancing performance. Mr. John le Hay appeared quite a master in ventriloquism. Two lay figures were used representing Mr. Someone and his wife, both types of the irrepressible couples sometimes met with, with whom conversation is impossible for their interruptions. As a last resource they may be asked to sing a song, and then matters are not bettered, as husband and wife make known their entire depreciation of each other. When the curtain was raised the two headless lay figures were seated on the stage. The operator fixed the heads and dexterously manipulated them. The boisterous voice of Mr. Someone contrasted well with the squawky voice of his better half, but it was in vain to look for any sign that Mr. Le Hay threw his voice into them. Mr. A. Nelstone afforded much amusement with his antics in india-rubber shoes. Mr. R. B. Hopkins well sustained his part in hand-bell ringing. Mr. Fred Frampton was among the best with a recitation, and Mr. Dudley Causton well reminded the audience of the late Corney Grain's talent. Mr. Harry Tate gave some imitations, one of Mr. Robey. Others who contributed were Mr. Frederick Upton, Mr. Lovell Fry, Mr. A. Faber and Mr. C. Birkett.

The second part of the entertainment was the acting of a bulesque in one part, "King Arthur: an Examination of the

Past," composed by Mr. Arthur W. Earle and Mr. E. Howley Sim, and executed by members of the Association.

Characters.

The King ...
Sir Lancelot ...
Sir Mordred ...
Sir Percival ...
Merlin ...
It ...
Guinevere ...

Mummers.

J. Dixon Butler.
A. Harris.
H. Phillips Fletcher.
C. V. Cable.
R. Minton Taylor.
T. H. Lyon.
G. B. Carvill.

The songs during this part included parodies of the following songs:—Baby on the Shore, Brown of Colorado, Tin Geegee, Where was Moses when the Light went out, Golden Hair, Postillion of Love, Happy Darkies, Trinity Church, Houses in Between, Alabama Coon, Happy Home, It ain't all Lavender.

SCENE.—*Camelot, the Seat of the District Surveyor* (devised and executed by E. Graham Simpson, of the firm of W. B. Simpson & Sons, 99 St. Martin's Lane), the proscenium and stage being erected by D. C. Hancock & Co., West Ham Lane, Stratford, E.; dresses by May, of Bow Street; wigs by Hugo, of Chandos Street; and the pianofortes lent by Steinway & Sons.

During the evening the Bijou Orchestra played under the conductorship of Mr. Samuel Dodwell, and the entertainment committee were also indebted to Captain White, L.S.R.V., for much assistance.

The frontispiece of the programme was a capital adaptation, "The A. A. Knight, goes forth to fight," with apologies to Olympia, Limited.

With apologies to the authors we venture to give the following version, very shortly, of the amusing and well-acted play, as an indication only of the subject. Students of architecture have a keen perception of the fads of their elders, and the usual good-tempered skits were not absent; and as the present members grow aged and get their fads it may be supposed, they will enjoy being "taken off" in their turn.

The scene as above was Camelot—"Ye seat of ye District Surveyor."

The time—"Inquire at King William Street."

The King and the remnant of his Round Table companions have buried the swords "for fights," to see what they can do with "ancient lights." Some one calls; he has come for a plan. It is not quite ready. Lancelot inquires what is the thickness of a staircase string. Merlin, who made an excellent sage, and would be unapproachable as a clown, explains—and leaves the matter unexplained. There is a ring at the bell, and some consternation; but it was not the water-rate collector but Sir Percival, a new pupil just come in time, for the rent is due, and Sir Percival's pa has a large account at Coutts's. He comes "to sit at gracious feet, and learn the art of architecture sweet." He had sat at other feet, and accompanied those footsteps in divers journeys and excursions to foreign lands, to find his knowledge was even as it was before. Not the vulgar art of building will I teach thee, says the king, but the glorious traditions of art. See the buildings of Camelot—the institute of our late imperial kingdom. "Observe the beauty of the ornament, the expression of the lions before it, and the cunning hand which has applied the detail of a drawing-room cabinet to the greatest building of our city." Secondly—No; it is not a Dutch warehouse. Thirdly—Something wanting? Yes, erected in summer, there is no frieze. And the warriors grasping each other's palms? Only the architect shaking hands with the sculptor. The museum of antiquities? It is not yet up. It will be when Lord Hatfield next rules the Assembly. Next building not yet up either. Plans got out, and it went best with the buildings over the way—the new premises of the world-famed A. A.

The king is reminded that his annual exam. is on that day; therefore he must away, but first he must know how to answer questions. What was Wren architect of? Lancelot thinks he was architect of all the fire insurance offices. Mordred explains the meaning of an entasis as "a sort of swelling cultivated by the Greeks." How many columns in Gloucester Cathedral? The sage, Merlin, replies as many on the south as there are on the north. How is terra-cotta made? Lancelot says ask Sir Leonard Aloysius. What are the duties of an architect? Mordred: To do all the work and get nothing for his pains. A two-horse chariot, with conductor at the back, crying, "City, City, the Bank," is then secured for the king.

In the absence of the king, Lancelot, field-marshal and past master in smoking concerts, says, "I boss this show. By right, gentlemen of the artists." When Lady Guinevere appears Mordred is distracted from his "provide and fix," and Lancelot from his half-inch detail of a syphon trap. Says Lancelot, "All who fail to pass the F.R.I.B.A. exam. must be stripped of yellow jacket and peacock's feather." Guinevere, however, proposes to Lancelot. Lottie, he says, she must call him; and he accepts conditionally on having permission to pack a carpet bag. Guinevere helps him in a light and air case by a prompt suggestion to tip up the horizon.

Guinevere is enraptured with Lancelot's talents—believes he could carry off the Soane Medallion in a bad year, and his taste in perspective is nearly good enough to take in washing when times were bad, and if not able to pass the R.I.B.A. exam., at all events the intermediate. And then he had won the competition at Weston-super-Mare, in spite of the referee being his first cousin; but he had not sat at tables of dukes and shot the pheasants of American millionaires for nothing. "Noble of thee to work for 3 per cent., and no travelling exes."

Pleasant for Sir Lancelot, and quite the reverse for Mordred, who in regard of Guinevere felt himself "spoofed." Merlin, the sage, consoles him thus:—

Oh, fates that rule around, provide and fix
That ne'er again for him shall mortar mix;
That all his best stock bricks shall turn to shuffs,
Whene'er he uses reds they turn to buffs.
May all his full-size details go astray,
And terra-cotta turn to unburnt clay;
And iron girders and all R. I. J.'s his
Belgium become and go to blazes.
Let him be thrown from a height at least three feet,
Be well rammed down and cemented neat;
And all that shall be left of this false knight
Be six inches of good cement o'er the site.

The king returns, and a letter of instructions for a competition comes in by post. The struggles to get the drawings out by division of labour are amusing, and for drawings so got out no motto could have been more appropriate than "Design in haste, repent at leisure." They had "bits" of all the best work in the kingdom in them, as gained from the professional journals.

As a result of his examination a despatch is sent to King Arthur that he is doomed to execution, not, as he imagined, for forgetting to provide accommodation in the lunatic asylum for the examiners, but for failing in knowledge, failing to give at a moment's notice all information in Gwilt, together with entire ignorance of the clauses of the London Buildings Act. But Guinevere comes to the rescue. "I will save thee. Knowest thou not that no man may wield the executioner's sword unless he can say of his own knowledge what is the use of examination?" Then Lancelot, after finding his intended has sufficient to pay the bus ticket, goes off with her, to be more or less happy for ever after.

The humorous skits were mainly to be sought for in the songs. One of the officials of the County Council was present rather conspicuously till some of the songs had been given. The professional press got off well, except in one case, where a little gentle satire was administered. A call was made for the authors, who on their appearance were well acclaimed. About 25 minutes to 12 the National Anthem struck up, and the company dispersed to catch trains, if they could, to take them home. It is to be hoped the member *en route* for Waterloo Station caught his train. "Oh, yes, you will just have time to catch it," were the last words your reporter heard on leaving the L.S.R.V. Hall.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. F. C. Penrose, president, in the chair.

The President excused a slight delay in opening the proceedings by saying they had received a deputation of architects from Westphalia, who had presented the Institute with two valuable books.

The decease of Mr. Piers St. Aubyn, elected a Fellow in 1856, was announced.

Anglo-Saxon Architecture.

Professor G. BALDWIN BROWN read a particularly interesting paper on the above style. He wished that the Institute could see their way to deal with this historic subject, the details of which were mostly hidden away in obscure localities, and were only known to local archæologists. It appeared from Professor Brown's remarks that Anglo-Saxon architecture never existed as a style. He cited numberless instances of churches of Saxon origin—pre-Conquest buildings he called them—that were neither distinctly Roman or Norman. At the close of the eleventh century it was more easy to distinguish between the works than those of the earlier decades. Saxon buildings, however, possessed individuality and distinctive features. They showed a noble rudeness exercised by the primitive architects. Contrary to Norman usage, large stones were employed, endowing the buildings with a megalithic appearance. The ornament was bizarre, rude and massive, and the elaboration mostly childish in enrichments and details.

The Saxon churches were distinguished by the clumsy and peculiar forms in the application of Roman or other motives. These he traced as originating from Roman and Celtic styles. The numerous buildings and monuments he cited so amply, it

would seem, corroborated his views. He alluded to a want in architectural literature. Even Rickman had concerned himself rather with details of buildings than reference to buildings as architectural in their finished state. The Saxons had mainly expressed Roman or Celtic details in their own forms. He strongly urged that the Institute should focus the labours of so many workers all over the country, by bringing together their varied information.

The PRESIDENT said he could not then say whether the Institute could do more than seek for information through the allied Societies.

Mr. RICKMAN proposed a vote of thanks to Professor Brown for his paper. He alluded to his father as an accountant; therefore his father had been inclined mostly to details and minutiae.

Mr. WILLIAM WHITE, F.S.A., seconded the vote of thanks, and then took Durham Cathedral as a subject for his speech.

Mr. R. PHENÉ SPIERS supported the vote, which was carried by acclamation.

THE COCKBURN ASSOCIATION.

THE report by the Council of the Cockburn Association, Edinburgh, expresses regret at the death of Lord Moncreiff, who was among the founders of the Association, and up to the last took a warm interest in its affairs. During the past year fewer subjects than usual were presented for the consideration of the Council, and this circumstance afforded an opportunity for giving some attention to measures for extending the activity of the Association. With this object two sub-committees were appointed, in the one case to consider the whole question of the Dean Valley from the Dean Bridge upwards to Coltbridge, with a view to its being opened up to the public, and in the other case to watch all alterations, actual or projected, in connection with the city improvements in the Old Town. A variety of subjects engaged the attention of the Council, including their suggestion that the railed-in ground to the east of the national monument on the Calton Hill should be opened to the public; unsightly advertisements and advertising hoardings; the opening of Holyrood Palace gardens to the public; the reported proposal to carry a tramway route along the Middle Meadow Walk, of which the Council disapprove; the erection of new seats at Rest and be Thankful; the condition of the buildings towards the west end of the Castle Rock; the apprehended danger of the view of the city from the locality of the Northern Park being injured by the erection of a row of houses on the south of the Arboretum, and the improvement effected by the removal of the old buildings on the west side of Bristo Street. In the paragraph dealing with the Castle the Council say:—"They beg once more to express their profound dissatisfaction with the condition in which the barracks and other buildings towards the west end of the rock have been allowed to remain. These buildings have been the subject of constant complaint for many years, and it is understood that funds specially appropriated to the Castle actually exist, and are applied to other purposes. Whether this is so or not, the present state of the Castle is a disgrace to the authorities."

Lord Kingsburgh, the Lord Justice-Clerk, in moving the adoption of the report at the annual meeting, said it referred to a number of subjects, and gave hope that some good was being effected. He was very glad to see that the North British Railway Company were inclined to accept a remonstrance against the placing of large advertisements upon the Waverley Bridge facing East Princes Street Gardens. Whether they should be able to effect anything or not they did not know, but in the meantime they had the Company's profession of goodwill, which was always something to work upon. Another important subject was that of the signal cabin in East Princes Street Gardens. All of them had felt that after the report made by the official inspector of the Board of Trade it was not possible to oppose any further the erection of a signal-box in the middle of the space occupied by the railway company; and his own opinion was that a cabin erected in the middle of the railway lines would not shut out any of the view of the gardens, whereas if erected in a recess it would have obstructed the view very considerably. The beautifying of the Castle, and the removal of discreditable buildings there, was making progress. He knew from communications he had had personally with the General commanding the Scottish district that there was a great anxiety on the part of those really interested in the matter connected with the War Office to have an improvement made there; but he thought it very advisable that the Association and the citizens should use as much pressure as they could to have it speedily done. Concerning the Northern Park and the Arboretum, he thought it would be a great improvement if the roadway which ran between the two were taken into the public ground of the city and used as an avenue. The formation of a walk for the citizens along the Water of

Leith from Coltbridge down to St. Bernard's Well would be a great thing to achieve, and he thought there was every prospect of its being accomplished. In conclusion, his lordship urged the desirableness of increasing the membership, with a view to increasing the influence of the Association. The Earl of Stair seconded the adoption of the report. Sheriff Vary Campbell quoted a denunciation of the Castle buildings by Lord Cockburn made as far back as 1849. Since then the authorities had done nothing, and it was only use and wont which enabled the people to bear with the hideous erections on the Castle Rock. The report was adopted.

TESSERÆ.

Coloured Limestones.

IN most countries there are found immense beds of limestone of various geological ages, some from below the coal that is older than it, and others newer than it. The former are usually very hard, compact, and sometimes nearly as crystalline as primitive limestone; they break generally with a peculiar smooth surface, and, from the resemblance of the broken surface to some forms of shells, are said to have a conchoidal or shelly fracture. This peculiar hardness and evenness of texture render them capable of assuming a high polish, and many of them are consequently employed as marble. These rocks are usually coloured, sometimes uniformly as the black ones, but more usually unequally, so as to produce a variegated effect, which is often very beautiful. The colouring matter of the various shades of black and grey is charcoal, derived from the remains of animals, and probably also of vegetables. White is the natural colour of carbonate of lime, while the various shades of red, yellow, purple, &c., are principally produced by compounds of iron. It must not be inferred from what is here stated that it is only the old limestones which are sufficiently hard to serve as marbles. Many varieties of marble have also been obtained from beds of the same age as Portland stone; they are not, however, so general, and there is a much less variety of colour among such marbles than among those derived from beds of the age of our limestone rocks. They are usually of a greyish tint, and are occasionally sprinkled with rounded dots, which look like the roe or eggs of a fish, hence the name oolitic is sometimes applied to such marbles. Other shades also occasionally occur. Even the most recent deposits of carbonate of lime may have the characters of marble, the most essential of which is being crystalline, as is shown by the marble-like casts of medallions, &c, which are at present manufactured at the baths of San Fillippo in Tuscany. Here a number of warm springs issue, so loaded with carbonate of lime held in solution by carbonic acid, and with gypsum, that the water has been known to deposit a solid mass of rock 30 feet thick in twenty years; this water is conveyed by a pipe to the top of a chamber, whence it is allowed to fall as a kind of dense rain from a height of about 12 feet to 14 feet, a number of twigs being interposed to break its fall and scatter it about in spray, which, falling upon the moulds that are intended to be copied, and which are previously washed with a little solution of soap, coats them with a marble-like deposit. In a country where such deposits are even now forming, one may expect to find a great variety of marbles of various ages, and accordingly Italy has been celebrated for its coloured marbles from the remotest antiquity, and even still supplies Europe with a large part of the marbles employed in decoration.

The Organ.

The origin of the organ is hidden in obscurity, and all we can learn is that it seems to have been borrowed from the Greeks, as Vitruvius describes one. He attributes the invention to Archimedes (two hundred years before Christ); and Ctesibus improved upon it by the use of water and of keys. The ancients employed the fall of water, pumps and different kinds of bellows to cause the motion by which the wind was introduced, and at last stopped at the wind bellows, which was set in motion either by water or human strength. Hence arose two kinds of organs: that moved by water was called hydraulic, and that by wind pneumatic. However, there was no difference in the principle, as it is only by air the pipes can produce a sound. Although the earliest descriptions appear to belong to the hydraulic, it seems natural to suppose the pneumatic one to have been first invented. An engraving given in Sir John Hawkins's "History of Music," from a monument in Rome, seems to confirm the latter opinion. That mentioned by Vitruvius was an hydraulicon. Du Cange quotes an epigram descriptive of an organ said to have been in the possession of Julian the Apostate in the fourth century, and concludes that it was not an hydraulic instrument, but resembled much the modern pneumatic organ. St. Jerome mentions one with twelve pairs of bellows and fifteen pipes to each key, which might be heard at the distance of a mile; and

another at Jerusalem which was heard at the Mount of Olives. Pope Vitalian is generally allowed to have been the first who introduced the organ into the service of the Catholic Church, about the year 670. Dr. Burney says that ancient annalists are unanimous in stating that the first organ seen in France was sent from Constantinople as a present to King Pepin, father of Charlemagne, by Constantine, in 757. This, as well as Julian's epigram, gives the invention to Greece. It is curious that the Venerable Bede, who died in 735, notwithstanding his minute description of the manner in which the psalms and hymns were sung in the churches, says nothing of the organ. However, according to Muratori and Mabillon, organs became common in Italy, Germany and England during the tenth century, about which time they were admitted into the convents throughout Europe. The poet Mason, in his "Essays on Church Music," gives several historical notices concerning the origin and progress of the organ previous to its general admission into churches. These early attempts were very rude in construction; the keys were 4 or 5 and sometimes 6 inches broad, the pipes were of brass, and the compass did not exceed two octaves in the twelfth century, about which time half-notes appear to have been introduced at Venice. A description of one procured by Elfeg, Bishop of Winchester, for his cathedral in 951, states that it was the largest then known, having twenty-six pairs of bellows, requiring seventy men to fill them with wind. It had ten keys, with forty pipes to each key. There was also one at Canterbury Cathedral previous to the year 1174. At Venice, about the year 1471, the important addition of pedals was made by a German named Bernhard, to whose countrymen we also owe most of the other improvements. The organs built by Schmidt for St. Paul's, the Temple, St. Mary's, Oxford, Trinity College, Cambridge, &c., were commonly confined to four octaves from CC in the bass to C in alt. They are very superior in tone to the generality of modern instruments, so much so that they have had their compass extended and many other improvements added during the last century by Byfield, Snetzler, Green, Gray and others. The earliest organ-builder in England was William Wotton, of Oxford, who built in 1482 an organ for Merton College; also one for the chapel of Magdalen College. The old organ at York (since burnt) was one of those that escaped the destruction of those instruments during the civil wars, although Cromwell himself was so fond of the organ that he caused the one at Magdalen Court, Oxford, to be removed to Hampton Court. It was afterwards restored to the College, where it remained till 1740, when it was removed to Tewkesbury. In 1660 there were only four organ-builders in England.

John Glover and Birds.

One of the founders of the Water-Colour Society was John Glover, and in 1815 he was elected president. Three years afterwards he retired from the Society, in order to become a candidate for an associateship in the Royal Academy. He was not, however, successful. In 1824 he helped to found the Society of British Artists. At one time Glover proposed retiring to the North of England, but instead, he emigrated to the Swan River Settlement, and he was consequently the pioneer of art in Australia. He died in Launceston, Tasmania, in 1849, in his eighty-second year. Glover devoted himself to landscape, but he carried perhaps his knowledge of birds beyond that of any man who ever lived. It was his custom in the summer season to visit the most romantic parts of England and Wales, and there to pitch his tent and draw and colour from nature. He chose for his retirement the vicinity of some unfrequented village, and being very abstemious in his diet, contented himself with the humble fare that the nearest ale-house afforded. His sole companions in these excursions were birds, with whom he held colloquy, professing perfectly to understand their language and to have made them conversant with his own. Pigeons were his favourites, as being most intelligent. Of the latter species he had one who would sit on his shoulder while he was at work, and who, when evening came, was wont, at a given signal, to fly home and await his master's return. One day the artist made a circuitous route, and being interested with sketching some newly-discovered scene, or catching some extraordinary effect of light, forgot the hour, when he was surprised at seeing the little creature soaring above his head, and at length alighting on his accustomed perch. When seated there, it expressed, by the querulous tones of its voice and the sharpness of its beak, its displeasure, which Glover was for a while puzzled to divine the occasion of. He soon, however, threw him up in the air, and pointed towards the encampment; but his attached friend resumed his old post, and would not be driven away, nor would ever afterwards be induced to lose sight of him, being afraid, as the painter said, that it was his intention to give him the slip. Starlings, he used to say, were possessed of great genius, and being asked which of the feathered tribes were the least so, after a pause he replied sparrows—not that they wanted talent, but that they were vulgar fellows. He had made the habits of birds so much his study that when a lark

was hovering over a field he could tell whether the songster had eggs, a callow brood, or if the young were full-fledged; in fact, Jean Jacques was a mere ignoramus compared with him. It is a pity he did not leave us, before he went to the New World, a complete grammar and dictionary of the particular language of each species, and an exact prosody for rightly comprehending the intonation of the words. Thus perhaps he was convinced that nightingales or thrushes (the finest songsters, by-the-by, of the two) do not sing for the pleasure of singing, but of conversing with one another and conjugating the verb "love."

Varieties of Slate.

Slate is the generic term applied to all fine-grained argillaceous or clayey rocks breaking into thin laminae. When the laminated character is but imperfectly developed the term "shale" is used; when it is so perfect that the rock readily splits into thin even plates it is called "roofing-slate." The colour of slate rocks is as various as the degree of lamination; the chief colours are, however, gray, greenish gray, green, purplish and dark blue. Roofing-slate is almost always of the latter colour. Slate rocks insensibly pass into grits according as the argillaceous constituent diminishes and that of sand increases, the property of laminability diminishing in the same degree. The finer and more argillaceous the slate, therefore, the better adapted it is for yielding roofing-slate. When slate rocks are in contact with large masses of igneous rocks, especially with granite, they undergo a remarkable change, being, as it were, baked into what is called mica slate, which sometimes passes almost completely into mica, one of the constituents of granite. Where the rock thus altered had been originally a fine-grained slate, and the baking not proceeded very far, it may still be used for roofing slate, being more durable than the unaltered rock, although the slates are not so even. Good roofing-slate should be of a uniform fine grain, should split easily into even plates, which may be easily pierced with holes by a sudden blow of a sharp-pointed instrument without being fractured; its colour should not be very dark, as that indicates a large quantity of carbonaceous matter, the presence of which assists in the decomposition of the slate; it should also be free from pyrites, and, finally, it should not absorb much water either by its surface or edges, a point which is readily ascertained by weighing a piece of the dry slate, plunging it in water, and then weighing it again after the surface had partially dried. Although the less perfectly laminated slate-rocks are sometimes used as a building material they are not well adapted for that purpose. The finer kinds of roofing-slate, when large-sized slabs can be obtained, are adapted for many useful purposes besides the roofing of buildings, such as the construction of cisterns, acid condensers, billiard tables, benches for laboratories, baths, &c.

Farm Buildings.

Under improved farm management there are two departments of business, each requiring special and particular attention—the one consists in the tillage and improvement of the soil so as to make it yield the largest amount of produce, and the other of the economical conversion of a large proportion of that produce into meat for the butcher and into milk, butter and other articles. It is obvious that it is equally important to attend to the latter as to the former consideration. Good tillage will not avail unless the necessary arrangements are made for the disposal of the produce, and this can only be done by suitable buildings to admit of these arrangements being economically carried out. The first consideration in buildings of any class is fitness for the intended purpose. To secure this it is obvious that a knowledge of the desired requirements must precede any successful effort to realise them. And not only should the plan of any intended farm-stead be adapted to the most improved system of management, but it should be specially designed for the farm, and even for the situation, in which it is to be placed. Some special knowledge of the details of agricultural practice is evidently required to attain this end—a kind of knowledge in which the ordinary architect is deficient. The most fantastic and unmeaning buildings are often produced, exhibiting an utter ignorance of the purposes for which they were required, and to attain some fancied symmetry every other consideration has been made subservient. On buildings of any pretension the outlay in most cases has been ridiculously extravagant. When the interest on this sum becomes a tax on the farmer's profits, any unnecessary expenditure becomes wholly unjustifiable, and every such case, instead of providing a model to follow, only serves as a beacon to others to guard against falling into similar mistakes. Suitable farm buildings have now become a necessity of improved husbandry, without which it cannot be carried on. Hence the great importance of correct notions on the subject gaining ground in a country whose industry mainly consists in the tillage of her soil. The agricultural architect should be aware of the conditions under which the objects of the farmer can best be attained. He has to consider, for

example, under what sort of treatment animals most readily take on flesh, for without such knowledge how can he provide the requirements? The proximity of certain classes of buildings is to be secured, the reason of which will be obvious. It is not, therefore, to be wondered that, in the effort to attain such objects on the part of the ordinary architect, sad blunders have been committed.

Varnishes.

Any liquid which, when spread over a substance, leaves on evaporation a thin coating of a solid hard substance, having a sort of vitreous lustre, as if the surface was composed of glass, may be considered as a varnish. Varnishes must, consequently, consist of two distinct classes of substances—liquids which readily evaporate when exposed to the air; and solids, which are capable of being dissolved in those liquids, and which remain behind as a hard, vitreous-like coating. The solid substances employed in the manufacture of varnishes are all of vegetable origin, and belong to that class of substances which, like tannin, are principally found in the bark of trees. These are usually considered under three heads—gums, resins and gum-resins. Gums are exudations from the bark of trees, which dissolve, or at least soften, in water, so as to form mucilages, but are insoluble in spirits of wine. Resins are similar exudations, which are capable of being melted by heat, dissolve in spirit of wine, but not in water; and gum-resins are substances of like origin, containing, as the name imports, mixtures of gums and resins. Although, properly speaking, a solution of gum in water, such as is used to stiffen and give lustre to silk and other textile fabrics, must be considered, according to our general definition, as a varnish, that word in commerce is confined to solutions of the true resins. But as these substances are not soluble in water, that liquid cannot form an ingredient of ordinary varnishes—the liquids which are usually employed being spirit of wine or analogous fluids, essential oils, and drying fixed oils. These latter do not fulfil one of the conditions which are laid down as constituting a varnish, namely, that the liquid should evaporate readily; but, in fact, drying oils are themselves varnishes, inasmuch as they become resins from the action of the air. Every resin is not equally well adapted for making varnishes; some will never harden perfectly; others, again, have peculiar colouring matters in them which limit their applications; hence it is very rare to find a varnish composed of only one resin, the usual custom being to mix several so as to obtain a compound having properties suited to the object for which the varnish is intended.

Sculpture and Painting.

A statue may be compared to a star, and a painting to a flower. The one is apart, unchanging, independent and sublime—it is full of a light that burns only for itself; it derives no apparent nourishment from any outward source; and it lifts our thoughts to hold communion with higher races than man. The other, belonging to our earth, and the child of it, is a portion of that nature to which we ourselves belong, is fed by the atmosphere we breathe and clad in colours which attract us the more because we irresistibly connect with them the notion of decay. The statue might be fancied the marble chrysalis of a spirit that will soon take wing to its planet. The painting is the exquisite and blooming bud that grows from the native soil of man.

The Etruscan Veii.

The ponderous masses of 10 and 11 feet in length, and some of more than 5 feet in height, are sufficient to evince the venerable antiquity of these remains. The position of some of the blocks shows that the propriety of uniting two upper stones above the centre of a lower block was not known, and denotes the construction of a remote period. One of the most singular facts attending this wall is a bed of three courses of bricks, each 3 feet in length, intervening between the lower course of the wall and the rock upon which it is built. That the Etrurians, and in particular the Veientes, were celebrated for skill in works of terra-cotta, is acknowledged. The quadriga for the central acroterion of the Temple of Jupiter (which was the object of dispute between the cities of Veii and Rome, and which, on account of the prodigy of the victorious charioteer at the Porta Ratumena, whose horses are said to have run from the racecourse to Rome without stopping (Plut. in "Vit. Publicol." chap. 13), was finally transmitted to the latter city), is among the noted instances of the superiority of Veii in works of terra-cotta; but it would be difficult to say what could have been the motive of employing brickwork in walls of so massive a construction as those of Veii. In other parts, owing to the bushes and an accumulation of earth, the foundations of the walls cannot be examined without excavation. It requires only a very moderate knowledge of the subject to convince us that the construction of the wall of Veii has no resemblance to anything remaining at Rome, nor yet at Nepi, Falerii or Tarquinii, where the ramparts were in smaller blocks and nearly regular. The style of the fortifications of Veii bespeaks a still higher antiquity.

NOTES AND COMMENTS

ALTHOUGH there may be an interregnum between the assumption of power of local authorities, ratepayers are not likely to benefit by it. Sooner or later all liabilities must be met. Some inhabitants of Barry, in Glamorganshire, have received a lesson to that effect. Up to 1888 the district was under the control of the Cardiff Union as the rural sanitary authority. Two years previously two streets were formed, and plans for houses in them were approved and carried out. The streets were not, however, formally taken over. In 1888 the Barry and Cadoxton Local Board was formed. As usually happens with new authorities, there was a high standard of work set up, with which the streets did not correspond. The owners were ordered to repave the streets, and as they refused, the work was executed by the Local Board, and proceedings were taken for the recovery of the amount. The county court judge decided against the Local Board, and consequently an appeal was brought and heard in the Queen's Bench Division. The Lord Chief Justice declared that the county court judge was in error in respect of the claim for channelling, kerbing, &c., and, with the concurrence of Mr. Justice CHARLES, the case was remitted to be dealt with eventually by an apportionment of the amount to be paid by the owners. It is evident that the owners of the houses in the streets have some reason to be discontented. They performed all they were bound to in order to satisfy the original rural authority. It may be assumed the paving was up to the standard adopted at the time. The owners could not be expected to anticipate a time when superior paving would be necessary. In such cases, notice of the proposed change of authority should be given, and if the making of new streets cannot be delayed, the character of the work that will become necessary should be announced.

THE Ordnance Survey has diminished the amount of work which fell to land surveyors, and in consequence they cannot be expected to take as much interest in the operations as their predecessors. When we read in the treatise upon surveying called "The Practical Surveyor," by Mr. THOMAS HOLLOWAY (H. COX), the statement "that the maps of the present day are far inferior in finish to those made forty or fifty years ago cannot be doubted; formerly young men practised penmanship till they produced satisfactory results; now they look upon such practice as a waste of time, and are satisfied with mere scrawls in lieu of penmanship, and rude indications in lieu of trees and other matters of ornament," we see one of the consequences of superseding the ordinary surveyor. His plans of estates often deserved to be considered works of art, and a possessor had a right to be proud of such a representation of his property. It is surprising that in this age of exhibitions somebody does not make a show out of specimens. There are, however, cases arising in which the Ordnance plans are of little use, and then the surveyor has to be called in. His occupation, therefore, is not entirely gone in this country, although by itself hardly enough to make millionaires out of practitioners. For those who wish to pursue surveying practice, which has many attractions, Mr. THOMAS HOLLOWAY'S instructions will be serviceable. They have the manner of the old school of men who believed GUNTER'S chain was the best of all auxiliaries. Surveyors were taught in the field, and they considered that was the best course for their successors to follow. It is characteristic of Mr. HOLLOWAY as a representative of them to say at the close of his book, "Although the pupil may have gathered a fair theoretical knowledge of land surveying from a careful perusal of the foregoing pages, he must distinctly understand that he has not gained an atom of practical knowledge." Few modern writers would venture to write in that strain, but it corresponds with the surveyor's mode of thinking—his geometry represents the eternal verities. It must not be imagined that Mr. HOLLOWAY'S book is not practical; in that respect his instructions are superior to what are found in many books on the subject. He begins with suggestions about outfit, and offers hints about field work and office work which are derived from experience. Every surveyor has his "dodges," and the author's triangulation and office procedure may not

be approved by all, but his method, if rightly followed, will lead to accurate plans and correct areas. What more can be required?

A MAN who was seven times Mayor of Bath could hardly fail to be a potentate in the city, and it might be said of Sir JEROM MURCH, who died on the 13th inst., that he was omnipotent. The works of building and engineering undertaken by the Council were inspired by him. Two years after he was elected a member of that body he proposed a resolution that "a handsome and commodious range of buildings, comprising baths with suites of living rooms," should be erected on the site of the old White Hart. Thirty years ago a hotel was not considered as adapted for municipal enterprise, but it was erected at a cost of 300,000*l.* and handed over to a company. On the baths the expenditure was about 12,000*l.* Next he endeavoured to improve the Avon and to obtain a larger supply of water. In 1891 he moved for the appointment of a committee to consider the accommodation in the Municipal Buildings, and two years afterwards the memorial-stone was laid. His energy was seen in many other public works. Sir JEROM MURCH could hardly have been so successful without confidence in his own infallibility. It was, therefore, risky to oppose his progress. In 1878, for instance, Major DAVIS discovered traces of the old Roman baths and invited Alderman MURCH to accompany him. What followed is thus described in the *Bath Argus*:—"The Society of Antiquaries was communicated with; Mr. MURCH set to work to solicit subscriptions, and at the cost of 1,000*l.* the remains were uncovered. Since then Sir JEROM had seriously disapproved of the policy of his companion in that subterranean tour. He was grieved, deeply grieved, at the new baths being built over a portion of the remains, and when there was a possibility of Major DAVIS being the architect of the Pump Room Annexe, a letter from Sir JEROM MURCH, who was kept from the Council by illness, protesting against it under the circumstances, started that prolonged and bitter contest which ended in the adoption of another architect." In other words, Major DAVIS was made to suffer because he carried out the instructions of the majority of the Council, which were not approved by the Alderman. A man of great energy and tenacity can be useful, but the possession of one of those worthies in a public body is not without its drawbacks for architects and engineers.

ONE of the pictures in the Louvre which is generally sought out by English visitors is the *Shipwreck of Don Juan*, by EUGÈNE DELACROIX. The great painter differed from his contemporaries in the arts by his admiration of English literature. He was supposed to have paid a tribute to the power of Lord BYRON by the painting of the picture. The English poet, however, was not thought about when the work was undertaken. It was suggested by a paragraph which appeared in the newspapers at the time about a party of sailors belonging to a wrecked vessel called the *Don Juan*, who were luckily rescued from one of the boats when they had drawn lots for a victim who was to be devoured. The grim scene inspired DELACROIX. Afterwards it was discovered that in BYRON'S poem there was reference to a similar experience, and accordingly in the catalogue of the Salon of 1845 the words "Lord BYRON, 'Don Juan,' chapitre ii," were introduced after the title of the picture. In that way he was able to present an incident which had startled Frenchmen, and to impart elevation to it by the prestige of BYRON'S name.

THE Austrian archæologist, Professor OTTO BENNDORF, has come to the conclusion that the remains of antiquity in Ephesus were not exhausted during Mr. WOOD'S explorations, although they occupied about ten years. He has, therefore, resolved to make further trials on the ground, and as a sufficient sum of money is at his disposal to pay for systematic work, it may be assumed that some more surprises will be forthcoming. The sculptured columns now in the British Museum were a revelation, and the famous temple may yield other novelties which will testify to the originality of DEMETRIOS and PÆONIOS.

NEW HIGH SCHOOL FOR GIRLS, DUNDEE.

THIS building, which cost about 14,000*l.*, is arranged to accommodate 900 girls. The architects are Mr. ALEXANDER McCULLOCH, C.E., and Mr. J. GRAHAM FAIRLEY, F.R.I.B.A.

A GALLIC TRIUMPH.

PAINTINGS relating to the continuous wars in France are apparently the most desirable for the public collections. M. CORMON has represented in the work we illustrate the return of the Gauls from one of those victories in which Roman discipline succumbed to the fierce attacks of the native tribes, and, as we see, some of the victors have carried off the spoils of the conquered.

SUSSEX CHURCHES.

A MEETING of the Society of Architects was held on Tuesday, the 21st inst., Mr. E. Hamilton, president, in the chair.

The Very Rev. Fred. W. Farrar, Dean Designate of Canterbury, was elected hon. member of the Society. The following were elected members of the Society:—E. C. Arnold, 55 New Broad Street, E.C.; C. E. Compton, Newport, Mon.; R. C. James, Clifton; Telfer Smith, Bult Wells.

Mr. H. GOODALL QUARTERMAIN read the following paper, entitled

Some Sussex Churches.

A run down to Brighton for business with a client is an ordinary occurrence in the daily life of many architects. With the exception perhaps for the change, or for the fresh air to be had, one is at a loss to find other reasons why so many are content to go again and again to a place which possesses so little architectural interest or beauty. There is only one building in Brighton which may be considered ancient, and that is the moderate-sized church which served the former inhabitants of Brighthelmstone. The town, so often described as a suburb of London, contains such shops and hotels as are to be found in a suburban west end. The modern buildings which justly claim an architectural merit are but few in number. Brighton is, as all such places are to the architect, a spot without a history.

But a few miles to the west, along the same coast line, will be found the ancient town of New Shoreham.

Shoreham graced with the grace of years,
Shoreham clad with the sunset glad, and grave with the glory that
death revere.—*Swinburne*.

I venture to think you will agree with me that here is to be found one of the most interesting though mutilated churches on the south coast. There is no church between Winchelsea and Chichester Cathedral at all to be compared in size, dignity and grandeur with this of New Shoreham.

Old Shoreham, at the mouth of the river Adur, originally a place of great importance, and probably one of the chief ports in the kingdom, was the mother church of New Shoreham. It is mentioned in Domesday Book as "Soreham," and "here is a church." Standing awhile on the South Downs just above the town, it is not difficult to imagine the cause of its importance or subsequent decay. You see the broad extent, and trace in the flat low-lying lands of "Shoreham Gap" the course, depth and moulding power of a tidal river; whilst you note the evident drift of sea-beach and sand-banks, which, as history tells us, has barred the harbour, and caused the river to seek an outlet into the sea a good mile and a half further east. The whole of this district in which the Shorehams are situate is known as the Rape of Bramber. It comprises no less than thirty-eight manors, together with the Castle of Bramber, now in ruins, and was conferred by William the Conqueror upon his Norman neighbour, William de Braose, the Castle of Bramber becoming the fixed residence of this fortunate nobleman. It is to this man and his successors that we are indebted for the first enlargement of the Saxon church of Old Shoreham mentioned in Domesday, part of which I am inclined to believe still stands, and also for the first foundation of the chapel of ease built nearer the coast, which preceded the church now known as St. Mary's, New Shoreham.

Shoreham, once able to furnish Edward III. with more ships than London, is now without harbour, trade or commerce, or even a beach which can easily be got at. It is, however,

not my intention to trouble you with too many particulars of the town, or occupy the time you so kindly place at my disposal in relating the history of the family which is now represented by the Duke of Norfolk (such information can be obtained by a study of Cartwright's and Horsfield's works on Sussex), but to endeavour to point out that enshrined within its area stands the church of St. Mary de Haura* (of the port), New Shoreham, a glorious architectural fragment, which is of only a little later date than St. Bartholomew's (1123), Smithfield, or Waltham Abbey, Herts. I mention these examples because they are near and because there is this similarity in their histories, the one being the choir and the other the nave of the original buildings.

The founder of the chapel at New Shoreham was probably William de Braose, grandson to the first lord of Bramber, who had made a gift of four churches with endowments to the monks of St. Florence Saumur, in Anjou. The deed of gift is now in the possession of Magdalen College, Oxford, which became possessed of it through Bishop William of Waynfleet, in 1459, and is thus patron of the livings. In its turn the chapel gave place to the church, of which first mention is made as having been begun by the monks in 1103. It is still later spoken of as "capella" in the taxation of Pope Nicholas in 1291, when its architectural importance must have been far greater than that of its mother church. At what time it became a separate parish is unascertained.

The church, as now existing, consists of the choir, with north and south aisles; the tower, placed over the crossing; north and south transepts, and one bay of nave; transepts and nave being covered with wood framed roofs. Of the nave the greater proportion has been destroyed. It probably consisted of six bays with clerestory and aisles. Its full extent is shown by a large fragment of the west end wall, which is still standing, and by considerable remains of its north and south walls which show above ground, and which there is every reason to believe were built of flint or sea-beach cobbles, with stone dressings, in the same manner as those walls now standing.

Originally about 198 feet long inside, more than 40 feet longer than Oxford's little cathedral, it has from some cause, not clearly ascertained, lost the whole (with the exception already mentioned) of the grand Norman nave, of which Steyning, a few miles inland, will give a good idea. Of this length the choir is 70 feet long by 20 feet wide. Across the transepts it measures 80 feet by 20 feet, the tower rising to a height of about 80 feet. The work of building the nave, transepts and tower begun in 1103, and was continued and added to during the best Norman period, following in a remarkable degree the fortunes of the family of its first founders, who, as we have seen, provided so largely for its progress and maintenance. The work remaining shows all those features to be met with in the style named: the square abacus with the peculiar hollow moulding under; the cushion caps to the square and semi-circular members of piers, notched out at the corners to lessen what would otherwise be a crude projection; the arches with deep recessed faces, with, in some instances, the chevron and label mouldings over. You find as the work proceeded, although full of indications of axe-faced stone (I need scarcely remind you that all Norman stonework was dressed with the axe diagonally), better finish, and a greater advance towards the refinement of the Transitional period, which had scarcely begun when the choir was commenced.

The Transitional period had made but little progress when the monks began the work of building the choir we now see. The Norman church had no doubt an apsidal termination at the east end, and in all probability others similar to both north and south aisles. To what extent these projected towards the east there is now no means of ascertaining, except perhaps by excavation, but the heights are clearly shown by a certain roughness on the eastern face of walls and arch supporting tower, also by weather mouldings which still exist to former roof.

The builders perhaps commenced by pulling down at the east end. Although there is no real proof to establish this theory as a fact, there can be no doubt that the later east end was begun just at the period of transition from style to style. Consequently, we find the most remarkable progress from the Norman to Early English as step by step this noble choir was built.

It is this choir which is now of chief interest, and claims our reverent attention as students, for architects must ever be students. Begun to be built at the time when the new style originated, it progressed slowly towards its completion, and one might almost sum up the means and resources its builders were possessed of. It consists of five richly-arcaded bays in the triforium, and clerestory to nave and north and south aisles. All are vaulted with moulded stone ribs filled in between with stone chalk; simple but effective quadripartite vaulting.

But the variety of treatment is to be seen, not described. On one side you have the sturdy circular columns of the

* "Haura" is debased Mediæval Latin for "havre"—a harbour.

Norman period used in conjunction with the octagonals of Early English type, on the other columns of engaged shafts supporting pointed arches with the deep hollows and rounds of the period arranged, as it were, in well-defined squared reveals, such as belonged to the style the builders were trying to free themselves from, with moulded and boldly-carved foliage to caps and bases.

On the one side the shafts for vaulting spring from floor, on the opposite from quaint corbels or carved foliage. There is the single Early English arch of triforium with its recessed faces and chamfers on the south side, and again the richly-moulded trefoiled arch to the east on north wall, alongside double-arched lancet lights westwards.

In the side aisles, as if in conservative admiration of the preceding style, a Norman arcading goes the full length of walls, and a stone seat for the accommodation of the monks.

Over the arcade are small round-headed windows. These windows are, however, chiefly modern insertions copied from an original.

The foliage to caps and to the enriched arches north side of nave will repay careful study. Sometimes one is inclined to think portions have been carved *in situ* without much setting out, and the way the carver has had to bring in his parts to finish is such as no modern architect would allow; we are far too precise and exact. We should not pass it, but the charm is there, and we feel that it was carved by a man.

Perhaps it would not be an error to assert that some of the carving to be found in the pier caps and some corbels to vaulting shafts was carved by one who had seen or carved similar work at St. Nicholas, Blois, Normandy. There was a constant intercourse between this port and the Continent; Richard I, John and Henry III. all made use of it. The various members of the De Braose family upheld this intercourse to an equal extent with the foreign trade, for they had obtained and secured to Shoreham the right of "free port," a great privilege, and nothing was easier than to select skilled craftsmen whenever required, just as they brought over the stonework. Beside this they retained their original possessions abroad and had enlarged the churches of them.

In one of the publications of the Cambridge Camden Society is the statement that some carving here in the form of mulberry leaves is in allusion to the family of Mowbray, one of whom married an heiress of the De Braose and became possessed of the estates.

This is said, I suppose, of the carving to arches on north side of choir, but there can be but little doubt that this portion of building was finished about 1200 or 1240, and the happy selection of John de Mowbray did not take place for many years after, for he was only thirty-six years old when he had the misfortune to be beheaded in 1322.

Of course we are well aware that this sort of allusion to a family name was of frequent occurrence in all kinds of decorative work, and took the various forms required, being most familiar to heralds. There is that very beautiful brass in Broadwater Church (mother parish to Worthing) to a rector, John Mapleson, who was also chancellor to Catherine, wife of Henry V. Here the maple leaf was freely used in allusion to his name, just as in heraldry the Lucys bore three "Lucies" or, the Shelleys their "shells," or the Tremains their "hands." All these details add undoubtedly to the interest and history of our subject; but in this case may not be quite true.

I am afraid no words of mine will convey to you the full impression of the nobility, the grandeur and repose, the charm of masses of light and shade, the variety in treatment and growth of this fragmental building. Look at the dedication crosses so frequent on the piers. I should like to see, and can fancy I see, the monks working with small means and slow progress, day by day, dedicating their finite work to the Great Infinite, as bit by bit they managed to begin some other portion of their liberal-minded, planned and spaced building; building their big hearts into their work as stone by stone was raised to be amongst the best and most permanent of all examples to architects.*

We are apt to forget that money and labour was just as dear in the old days as we so frequently feel it to be now, and that "here a little and there a little" had necessarily to be done when the means could be found. Perhaps to this we owe much of the charming variety of style and detail to be found in old work. We don't always appreciate the result, and I suppose an architect will never be allowed to design a church, for instance, in a variety of styles, or in any way approach the lesson the teaching of the ages has been to him.

The late J. H. Parker, of Oxford, declares, I think with truth, that photography alone is the great handmaid to the architect and archaeologist. In reference to the actual finish of details, the tool marks and jointing of masonry, nothing

could be better for bringing the facts before the student, and I think our Society therefore is much to be thanked for the liberal use it makes of photos and lantern enlargements. I am relying to a very great extent on this very point, and I trust the views shown will illustrate and make clearer to you the beauties of the church, as I feel they ought to be known. There is one feature of the east end worthy of notice, because it implies a certain amount of design for appearance only. The elevation is in two tiers, well defined and divided by string-courses. The lower storey has three circular-headed recesses with angle shafts, carved caps and transition mouldings to arches. The centre recess is pierced for a window, which was reopened in 1832; the other recesses are said to show traces of similar windows.

Above are three unequal-sized lancet windows, with piers and clustered shafts between, whilst the mouldings to arches are almost exactly those of the arches under them. Still higher in gable is a good wheel window, consisting of twelve lights, with small shafts and moulded caps in between. The whole forms a very fine east end; but the wheel window is not in the church, although filled with painted glass—it is above the vaulting.

The space above vaulting is difficult of access and its surface left very uneven; one is at a loss therefore to give the reason for this design, except for outside appearance. The small circular windows in side aisles are also above the vaultings.

I do not propose to go over every period in the history of the building. I wish to direct attention to its architecture, and not exhaust the subject; as you will surmise, much more could be said and many other details given.

To mention that the tower was begun by the Normans is but to repeat that which I have already said. This was added to in the Early English period to the extent of at least one storey higher. Flying buttresses were built to the nave of choir, and at a much later period several Perpendicular windows were inserted. At about this time also the west wall was built, to enclose the church within its reduced limits, which cut off the ruined portion, and this was done with Norman fragments. The present arch over the west door consists of stones worked with the chevron and other mouldings of the Norman period, but built as a pointed arch, calling to mind the alteration and rebuilding with old materials of the chancel arch at Broadwater in just the same manner, although not for the same reason.

In recent years the wave of "restoration" has swept over the building, and in its course swept away several Perpendicular windows inserted in south aisle, to make room for copies from "the antique;" in other words, an attempt was made to blot out a page of the church's history. I know I am now treading on dangerous ground without knowing the influence brought to bear upon the architect, but at the same time I am afraid architects have, by such work, frequently merited the censure antiquarians have awarded them, and the destruction of history is in my opinion to be regretted. Here again photography does us a good service and records the destroyed windows.

I must rely upon photography to show by way of contrast within easy distance a few other Sussex churches, such as the Saxon church at Worth, near Three Bridges, Old Shoreham, the tower of Southwick Church, and Sompting; also an interior of Chichester Cathedral. The churches in this district are usually small and without aisles, frequently without towers and without west doors, such as Old Shoreham, St. Botolphs, Coombes, Bramber, &c., and frequently also without west windows; the towers, where they exist, usually covered with low pyramidal roofs. Steyning, which was formerly a place of equal importance with Old Shoreham in its early history (for shipping came up the Adur much further inland, and no doubt contributed greatly to its trade and capacity for building its church with the fine Norman nave), never had a west door. The reason for this omission may be that the district is much exposed. It has frequently suffered at various times from great storms. There are in Sussex many stone and shingled spires, such as West Tarwig and Horsham spires. The manner in which the broach spire is placed upon the tower is particularly beautiful and the proportions most excellent.

To account for the small size and poverty in building churches within a distance of three or four miles inland, I think we can say the district has always been pastoral and the population small, just as it is at present.

In the church of New Shoreham there are now no monuments of interest, except one unknown brass of the early fifteenth century. All the windows and church fittings are modern. The font has been taken down and rebuilt in different places three times within my knowledge, but it still retains nearly the whole of its interest as an example of the square-shaped basin and base, with flat arcading on the four sides of basin, standing on columns, to be found in Sussex. Built of Purbeck marble it has well withstood its several other removals during a period of nearly 800 years, for at one time it must have been placed in that portion of the church now ruined.

* I have in mind a paper read a short time ago on "Freemasonry" before the Society.

MEANS FOR MITIGATING THE FADING OF PIGMENTS.*

IT is not my intention to-night to enter into the causes of the fading of pigments, whether water-colours or others. Were I to do so I should have to keep the meeting considerably longer than either they or myself would consider desirable. I think I must take it for granted that the conclusions Dr. Russell and myself arrived at in 1888 (the date when we made our report to Parliament) have not been controverted or whittled away, and may be accepted as correct. I must, however, quote two of the concluding paragraphs:—"It may be said that every pigment is permanent when exposed to light 'in vacuo,' and this indicates the direction in which experiments should be made for the preservation of water-colour drawings;" and "our experiments also show that the rays which produce by far the greatest change in a pigment are the blue and violet components of white light; and that these, for equal illumination, predominate in light from the sky, whilst they are least in sunlight and in diffused cloudlight, and are present in comparatively small proportions in the artificial lights usually employed in lighting a room or gallery."

At the end of the report we make some reference to glazing the skylight with yellow glass, and point out that it would be inexpedient to do so, as, although the safety of the pigment's colours would be thereby insured, or at all events be made more certain, yet in such a light the hues of these blue pigments would suffer to the eye.

The first method of preserving the colour of pictures by placing them in vacuo has been experimented upon by a company, and it would not become me to say what success they have attained in this direction. The method that I have adopted to minimise fading has been in the direction of controlling the kind of light admitted to the pigments. The point from which I started was from the results of the experiments made as to the fading of different pigments under coloured glasses. The glasses employed were red, green and blue, which are approximately the three primary colours, and it may be instructive to show you the rays which these three glasses allow to pass. If in front of the slit of the spectroscope a piece of red glass is placed we see that the spectrum is deprived of all the green and blue rays, only red, orange and a few yellow rays being transmitted. With the green glass the red rays are almost altogether absent, as are also the violet, but the green rays are strong, as are the blue-green, and there is a fair proportion of yellow and blue rays passing.

With the blue glass the violet and blue pass readily, the green and yellow and red are cut off, though there are two faint bands apparent in the yellow-green and in the red. It will be noticed that practically these three glasses divide the spectrum into three parts, (1) the violet and blue, (2) the green and yellow, and (3) the orange and red. The following table shows how little action takes place under any glass except the blue, and our statement that the greatest fading in white light is caused by the violet and blue rays is founded on it.

	White	Blue	Green.	Red.
Purple Madder . . .	Faded to 2	Faded to 1	—	—
Antwerp Blue . . .	No experiment	Faded	—	—
Leitches Blue . . .	Sl. faded	Sl. faded	Darkened	Darkened
Violet Carmine . . .	Faded to 1	Faded to 1	—	—
Payne's Grey . . .	Faded to 1	Blue	Blue	—
Indigo . . .	No experiment	Faded to 1	—	Sl. faded
Prussian Blue . . .	No experiment	Sl. faded	—	V. sl. faded
Rose Madder (two experiments) . . .	Sl. bleached	Sl. faded	—	—
Brown Pink . . .	No experiment	Faded to 3	—	—
Crimson Lake . . .	No experiment	Faded	Sl. faded	Sl. faded
Vandyke Brown . . .	No experiment	Faded to 1	Sl. faded	—
Vermilion . . .	Darkened	V. sl. darkened	—	—
Carmine . . .	No experiment	Faded to 3	Sl. faded	—
Gamboge . . .	No experiment	Faded to 1	—	—
Indian Yellow . . .	No experiment	No change	—	—
Sepia . . .	Become lighter	Become lighter	—	—
Burnt Sienna . . .	No change	No change	—	—

Other experiments have shown me that the violet rays are the most active in producing fading, as they are also in producing an ordinary photographic image. If we can eliminate the freshness of these rays from white light without appreciably altering the colours viewed in such light, we shall practically have prolonged the life of a picture. At first sight that these conditions can obtain may appear problematical; but I trust that you will agree with me shortly, that we can so cut off the rays without injuring the hue of the colour.

Now I must ask you to take it from me, from a series of experiments made, that ultramarine is the colour whose dominant colour is nearest to violet end of the spectrum; and when I say dominant colour, I mean a colour which has approximately the same colour as the spectrum colour, though it may be mixed with white light to a variable amount.

We can show the dominant colour of some pigments. For instance, here is an orange pigment; I can match that in the spectrum by one orange ray. Emerald green I too can match, but we must have a certain amount of white light mixed with it. Pure ultramarine, too, we shall see, has a dominant wavelength well below the G Fraunhoferline. It therefore follows that if we illuminate all pigments with a compound light, in which this ultramarine colour is included, they must appear appreciably the same as they do in white light.

I must guard myself, however. Do not let us suppose for one instant that these dominant colours are alone those that are reflected from pigment. They reflect a good many more. We can show that this is the case. I place a pigment in the patch of monochromatic light from the spectrum, which can be changed at will, and the more luminous the pigment appears in any particular colour, the more of that particular light we know is reflected. Thus we place emerald green in the patch and we see that it reflects but little red, more yellow, a maximum in green, and a very little blue. We also find that vermilion reflects a maximum in the red, very little yellow, and practically nothing else. Ultramarine, we find, reflects a very little red, no yellow, a very little green, plenty of blue, and some violet. If we cut off the violet from the spectrum and place the ultramarine in it we shall, however, find the colour appreciably the same it was when the violet was present.

A variety of experiments made with these different pigments tell us that the loss of the violet of the spectrum is practically no loss at all. Even with white light the loss is unnoticeable. If we form a patch of light composed of all the colours except the violet, we shall notice but very little change from the pure white which is alongside of it.

Having established this fact, we are now in a position to go a step further.

In the apparatus I have here at hand I can place three slits in the spectrum, and by means of a convex lens of proper focal length and curvature, I can cause these colours to recombine and form a patch of white light, being an image of the prism. The slits are now in the spectrum, and a patch of pure white light alongside. I alter the width of the slits till they show the patch of the same colour as the comparison white. The colours are red, green and blue. Now the red and the green themselves when mixed form a yellow, and this can be demonstrated by covering up the slit through which the blue issues—you will see a yellow patch on the screen; evidently, then, since red and green make yellow, a yellow and a blue will form white light. To prove this further, I place a slit in the yellow and another in the blue, and we have white again formed. As a matter of fact, with any kind of yellow and any kind of blue there is always some blue ray and some yellow ray which will form white light by mixture. But it does not follow that such a white light is a proper one in which to view coloured pigments. For instance, in this mixture of blue and yellow of the spectrum I place an orange; you see it appears yellow, or if I place a green in it it appears whitish, and so on. I might multiply my experiments in this direction, but they would only prove that there must be something beyond a mere match of white light to make it effective as a pigment illuminant. That "something beyond" is really a continuous spectrum. That is, every ray must be present except the violet rays, which have been shown to be practically useless for giving illumination (I may mention that the yellow ray has about 200 times the illumination of the strongest violet ray, which we can spare without detriment). Where a portion of the spectrum is altogether absent or deficient those pigments whose dominant colours lie where these deficiencies are to be found must inevitably alter in hue, just as we found to be the case just now. If we can get a yellow and a blue which together will have such a spectrum when combined together we shall have accomplished what we want.

Now here is a green-blue glass, such as is used for ordinary ships' lights. When placed in a beam of white light, a place in the spectrum can be rapidly found where the yellow is such as will form a white light with it, or a yellow glass can be placed in the white light and a blue ray found, which, when mixed with it, forms white light. You see the mixtures before you, and I fancy will not find much fault with them. If we compare the blue-green spectrum ray which forms the white light with the light coming through the yellow glass, we find that it matches the blue of the glass very closely. Evidently then we can mix the light coming through these two together, and they should also form white light. This we can easily test. The blue glass is now in one beam of white light and the yellow in the other. By superposing on the same screen these two lights, and then reducing them to proper proportions, we see that we have a white light which is a very close match to that of electric light.

Another step further we must go. Is the blue-green glass of that type which cuts off the proper amount of violet light? This we can answer at once by an appeal to the spectrum. We have the spectrum of the electric light on the screen, and place in front of the slit the glass. You will see that the violet almost entirely disappears, leaving the blue bright, but cutting

* A paper by Captain W. de W. Abney, C.B., F.R.S., read before the Society of Arts on Wednesday, May 15.

off the red. We can do the same with the yellow glass, and we find that it cuts off all the violet and a deal of the blue-green. We have seen what sort of a white a mixture of the two make, and we can tell what kind of a spectrum they make by rapidly rotating in front of the slit a sector in which are the two glasses showing proper proportions. We see now the spectrum of the combined lights upon the screen. It is quite different to that of white light, for there is no violet in it, and it has perhaps rather more green-blue in it, but this is an advantage, as it shows that the blues will not suffer when viewed in such a light. In fact a little more predominance, if anything, will be given to the blues. Had I used the ordinary cobalt blue glass you will see that I should have gained nothing in safety. The spectrum, with such a glass interposed before the slit, is again on the screen. You will remember that it is a banded spectrum, admitting all the violet and blue, cutting off the green, but allowing a band of yellow and two of red to pass through. As the blue-green glass cuts off the violet, we may take it that it is much safer to use light coming through it than ordinary white light, as far as the fading of pigments is concerned. It was in experimenting with this glass that I came to the conclusion that if we used the light passing through it as one component of a mixed light, and could find a light passing through a yellow glass which would neutralise it, we should have a valuable means of securing greater immunity from fading than we have by using white light alone. The yellow glass I have shown you was selected, not as the most perfect sample, but as being very transparent. If anything, it wanted a trace more red with it, but without it we get a combination which ought to answer every purpose. Let me show you how some pigments look in this light. I place a lens in front of the lantern and make a disc on the screen. Where the rays cross, a rotating sector is placed containing these two glasses, so that the disc is alternately illuminated by the blue-green and yellow-white. The change is so rapid that the two colours blend one into the other. I place various coloured pictures in the beam and note their appearance, and then illuminate them with ordinary white light of the same intensity. We find that the two are almost exactly alike, every colour shows in the one as well as in the other, and apparently a difficult problem is solved.

I well remember the first small experiment which I tried with these glasses. It was in a small photographic studio which we have at South Kensington Museum, erected for the use of outside photographers. A small portion was curtained off and the roof glazed with these glasses in proper proportions. Water-colour sketches were taken into this light and critically examined by some whose opinion I highly value. The chairman, for instance, whose exhibit at the New Gallery shows him to be a colourist of no mean order, approved, and so did the director for art, Mr. Armstrong.

So successful was the appearance that an experiment on larger dimensions was made by the authorities of the museum, when part of the roof of the gallery in which the Jones collection is housed was glazed with these glasses. The public freely circulated through the gallery, and as far as I know the criticisms which were passed were few, and certainly not as a rule condemnatory. The committee of artists, who acted as advisers in art matters to Dr. Russell and myself, when carrying on the investigations as to the fading of pigments, and of which Sir F. Leighton was the chairman, give it as their opinion that the lighting was satisfactory.

When the Raphael Cartoon Gallery was to be re-roofed the authorities directed that the glazing should be carried out with these coloured glasses to prevent, as far as possible, any further fading of these valuable works of art. The glazing is in alternate strips of the two colours (some few panes have been glazed with ordinary white glass to allow for slight modifications in the proportions of the two colours, if considered desirable) on the slope of the roof. The light, before coming into the gallery, traverses a flat skylight of corrugated white glass, which distributes and scatters the colour, even when sunlight streamed through the coloured panes. It has been a source of amusement to myself to stop in this gallery and note the effect the light produced on the minds of the different parties who passed through it. The large majority of persons saw nothing peculiar about the light, and failed to notice the coloured glasses in the roof, whilst others noticed it and could not understand what it meant. Americans seemed to be those who were most observant.

I have had the advantage of hearing the criticism of several artists regarding the lighting of this cartoon gallery, and the general dictum was that the colour and lighting were satisfactory. One artist told me he wished he could always have such a warm light in which to exhibit his pictures. He said it was a most becoming light. In choosing the proportions I was led to make a mixture which imitated as far as possible a warm sunlight. When the light is principally from the blue sky, this meant that the yellow light predominated a little more than it would do when the mixture was made by the electric light. In order to arrive at this colour, I took sunlight itself as the standard white, and adjusted the proportions of sky light

passing through the two glasses in such a manner that the warmth of sunlight was found in the mixture.

It may be of interest to know what the illumination is compared with glazing by white glass, that is, how much is cut off. This can be very readily ascertained by measuring the luminosity of each colour coming through the glasses.

We can make the experiment for ourselves.

First, I place the yellow glass in one white beam and alongside it send another beam of white light. By intervening a rod in the paths of the two beams, to cast two shadows, and, reducing one by rotating sectors, which can give a larger or smaller aperture at will during rotation, we can arrive at a point where the two shadows are equally luminous.

Removing the glass, the balance is again secured, and we find that in this case the aperture required is 60 deg., and in the other 85 deg., showing that the yellow glass allows 12-17ths of the white light to pass through it. We can do the same with the blue-green glass, and find it cuts off a deal more, allowing only 1-6th of the light to pass. Now, if half the roof be glazed with yellow glass and the other half with the blue-green glass, the total light passing through is only 45 per cent. of what would fall through the aperture of the roof if no glass were in it. Absorption and reflection reduces that loss to about 50 per cent., a great diminution, it is true, but still one which is made up for in several ways. In the Raphael Cartoon Gallery the open area in the new roof is considerably larger than it was in the old roof, and the light is practically the same as it was before. Further, the use of ground glass or blinds is done away with, ribbed glass being substituted. The ribbed glass, as before stated, helps the mixture of the two colours when falling on the pictures.

I do not say that the lighting is perfect and that improvements cannot be made in it. Science never comes to a finality, but I am bold enough to think that it is a step in advance. What may be termed the "fading value" of the light can be

readily ascertained. In the diagram before you we have the photographic absorption spectra of the blue-green of two yellow glasses, and of the two mixed lights. It will be seen that the violet is totally, or very nearly, inactive. In the ultra-violet there is a carbon band which is intensely active, photographically, in the electric arc light. This is slightly transmitted through the yellow glass, but in sunlight these rays are so weak that they only appear after very prolonged exposure. What the effect is may well be judged by taking an ordinary photograph in this gallery and in the adjoining one. I find that a bromide plate requires nearly ten times the exposure in the former than it does in the latter, when photographing a picture. Bromide of silver, being sensitive to the green, does not show such a difference as chloride of silver does. Here are two pieces of such paper exposed for equal lengths of time, viz. one hour, in each of these galleries. You see that whilst the piece exposed in the ordinarily lighted room is quite dark, the photographic action appearing on the other is very small.

What the extension of time for fading is I cannot say. Putting it as low as ten times, we have a considerable saving. Thus, a picture which in ordinary light would last ten years will, if hung in this light, last at least 100 years, and probably 200 years. In some calculations made in our report, Dr. Russell and myself stated that it would take 100 years in one of the museum galleries for pigments to arrive at the fading shown by our experiments. Had this glazing been adopted, we should have to have increased this time to at least 1,000 years instead, a time sufficiently long to enable further advances to be made in the knowledge of what will completely hinder all fading.

I have now shown you the reasons which led me to experiment with this glazing and to judge it as efficient. I trust the lighting of this Raphael Cartoon Gallery may prove not to be merely a safe experiment on a large scale, but a real step in the right direction, which may with advantage be adopted elsewhere.

Mr. W. F. Reid said that artists would only be too glad if they could obtain such pure colours on their palettes; but they could not dissociate colour from the material which produced it; and he should like to know if definite experiments had been made on the chemical action of light on the substances of which the pigments were made. With regard also to the medium with which the pigments were affixed to the substance, they knew that there were few substances in which the media used did not act. Even cellulose or paper had a certain chemical action on most pigments which were applied to it; and they naturally looked to one who was in the habit of using pigments to know how far the action of light would be modified by the chemical action of the medium to which they were united. The action of the invisible rays had been touched upon, but he did not quite catch what the action of the ultra-violet rays might be, or whether they were totally excluded. It was known that they acted chemically with very great vigour, but he did not know whether that action was altogether excluded by the coloured glass. The practical aspect of the question was of course very important; it would no doubt be possible to have artificial light of this kind in large public buildings, such as picture galleries, but he did not know how far it would be applicable to ordinary houses. It was quite clear that light of all kinds had a great influence, and perhaps the reason why such bright paintings were found in the Pyramids and in Pompeii was because they had been completely protected from the chemical action of light. If Captain Abney could point out any means of preserving paintings or the surface of woodwork covered with different pigments, it would carry a ray of hope to many people.

Captain Abney said the question of the chemical action of light on pigments was a very long business and the matter was still *sub judice*. The experiments were still going on, and as yet no report had been made, so that he was afraid he could not enter upon statements which at present he was unprepared to substantiate. With regard to the action of the ultra-violet rays that was a very small fraction of the radiation which affected pigments and must almost be disregarded. He did not suppose the ultra-violet radiation in sky light was one-fiftieth part of that which acted, and therefore if it were not dealt with at all, practically speaking no harm would be done; there might be some very slight effect, but it would be of no importance. But as a matter of fact these glasses cut off nearly all the ultra-violet. The violet bands in the arc were very strong and required a very great deal to cut them off. He had said in the paper that his starting-point was when Dr. Russell and himself tried pigments under different coloured glasses, and though that was quite true his researches dated back to a much earlier period. He used to be taken to church and sat in the chancel, where there was a window glazed with zigzags of blue and yellow, and it was always a great puzzle to him that his prayer-book was beautifully illuminated with white light. He had given them the explanation that evening, but it was a great puzzle to him for many years, and it was not until the colour experiments were made that he was able to answer the question he put to himself so many years before. If you could illuminate a small church with windows of this kind you could illuminate houses, though he did not say they should do so, but that was one way in which they could do it, and still have all the benefits of white light, and without the irritating effects which the ultra-violet rays were supposed to exercise on the retina. The retina of the eye itself was fluorescent, and whenever there was fluorescence it seems probable that nerve irritation may be set up. Houses might be glazed with quinine cells to get rid of the ultra-violet if thought desirable. He feared that was the only answer he could give to the questions which had been put.

BEATING THE BOUNDS.

AT a period when parish and district surveys did not exist or were not more accurate than some of those belonging to the Tithe Commission, it was necessary to trace boundaries periodically. The practice is not yet apparently obsolete in Sussex; but the misadventures which attended explorers on Monday may, however, be a recommendation of beating bounds and lead to a revival of it in parish councils. The following account by one of the beaters of the archaeological survival is taken from the *Sussex Daily News*—

When a quiet party of Hailshamites drove through the quiet High Street at 7.15 on Monday morning, at the commencement of a 25 miles' tour of the boundaries of the parish, it was not generally noticed that they numbered thirteen. Starting under such an omen, they could not have entirely escaped casualty without seriously impairing the belief in a popular superstition. But, indifferent to simple arithmetic, they started in a uniformly merry mood and discordant attire. Some had succumbed to the force of habit rather than given in to the necessities of the occasion, and completed their toilet with the studied nicety and completeness of professional men, which one or two had afterwards reason to regret. Others had

unearthed garments which had done better service than they appeared capable of rendering in the future; while a few, with some experience of "bound-beating," had equipped themselves in a highly judicious manner. The formal start was at Leap Cross. Opposite the Union the conveyance was temporarily discarded, and Mr. John Clay Pitcher, who had taken part in the last ceremony of the kind, assumed the lead of the party.

Mr. Pitcher, hatchet in hand, was the first to disappear in the thick hedge opposite the Workhouse and force his way through. He was quickly followed by the remainder, and the path was taken across fields and gardens, where the poultry set up a commotion similar to that with which they greet the rising sun. There was a general look round for a red head—an article which has, it is said, before now been mistaken by the feathered tribe for his Solar Majesty—but without result, and the shrill ovation was accepted as a tribute to a heroic band. Through several delightful fields, aromatic with spring flowers, softly carpeted with the young grass, and spangled richly with gill-cups and daisies, the party, with buoyant spirits, and lungs appreciatively receptive of the fresh morning air, wended their way to the matutinal melody of the nightingale in a wood close at hand. Harebeating was reached at 8.15, and the party resumed their acquaintance with the road, but only to cross over to another extent of meadow. At Goad's Farm commenced their day's experience with the "quont." The "quont," it may be mentioned—the correct orthography of the word is doubtful—is a long pole varying from 12 to 16 feet, with a "T"-piece at the bottom, used by the "lookers" over the marshes to negotiate the numerous "sewers" or dykes with which the country abounds. Most of the party were more or less familiar with this invention, but there were some to whom it was quite a novelty. They, however, at this early stage of the walk, where the dykes are narrow, used it with fair success, the older members of the party shaking off their years like magic, displaying the agility of youth and the facility of experience. A little further, after numerous escapades through hedges, across ditches and over stiles on which Mr. Pitcher left his hatchet's mark, an arch was discovered, which, while performing the functions of an aqueduct, also divided two parishes. The majority were quite content to remain outside of this, but Mr. G. T. Green made an exploration of the interior, without serious disfigurement. At Amberlane a bit of May blossom was plucked, declared by all present to be the first seen this season. Shortly afterwards, through a cottage garden bearing a wealth of apple blossom, the "beaters" emerged into the Battle Road and resumed their seats in the conveyance.

Here they became reminiscent. Mr. Terry vouchsafed the information that the first recorded ceremony of the kind in Hailsham was in 1685 and the last in 1875. It transpired that three of the present party had taken part in the latter—Mr. Pitcher, Mr. R. Vine and Mr. Boniface. In that year three of the survivors of the former "bound-beating," twenty years before, were "summoned by Government" to show the way, but from various causes they were unable to respond to the summons. One of these three, in the person of Mr. Henry Boniface, still survives. Mr. Burton retailed this gentleman's anecdotes of the old way of doing the thing, from which it appeared that the "beaters" used to be hired at 5s. per day. They took three days to complete their task, and had actually to "beat" the bounds, as well as walk through the ditches, and here and there, where any distinguishing mark was lacking, dig out a cross on the turf. They were accompanied by a Government official, who provided refreshments for all comers. Only those who had been on a former round were hired, the recruits qualified for the succeeding beating, and thus a knowledge of the bounds was preserved. It transpired, too, that on Sunday morning, at Hailsham Church, the Rev. W. J. Clay read that part of the Homily for the Sunday in Rogation Week having reference to the beating of the bounds. An inquiry casually arose as to the origin of the term "Leap Cross," and Dr. Gould supplied an explanation in the form of an acrostic. The cross was the sign post, and it pointed in the direction of Lewes, Eastbourne, Arlington and the Poorhouse, in the initials of which words will be read the present designation of the spot. A short halt was made at Carter's Corner to contemplate a huge reclining stone marking the spot where, before the revised demarcation occasioned by the Local Government Act of 1894, four parishes united, viz. Hailsham, Wartling, Herstmonceux and Hellingly.

Having taken to foot again, the "beaters" made their way to Gildredge Farm, occupied by one of Mr. R. Overy's tenants, the farmhouse standing in two parishes. An attempt was made, in order to observe strict accuracy in going over the bounds, to enter this by the window, but two iron bars precluded every one, except the slim young son of Mr. J. J. White, from performing this feat. The visit of the party had been anticipated, as was evident by the sacks spread over the floor in front of the window, and—what was a much more exhilarating sight—a supply of ale which Mr. Overy had thoughtfully provided. In the garden of this farm the promise of abundant

fruit on the plum trees, of which the flower had already blown, and the unusually luxuriant blossom of a large apple tree, were particularly noticeable. Getting again into the marshes, the pedestrians fell to discussing Mr. Guy's unintentional plunge in a certain dyke at the last "beating," and had scarcely had their last smile over this adventure when the ill-omen of the start began to work. Lo and behold, one of their own number—the journalistic member of the company, too—stood before them a dripping victim of his inexperience with the "quont." The majority accepted the situation with the heartiest humour, but the unfortunate cause of their mirth, it is to be feared, momentarily forgot the piety he had imbibed on the previous day, and, needless to add, did not share in the general hilarity. However, he had the benefit of the doctor's gratuitous advice, and this it will be no breach of gratitude to extend to others similarly circumstanced, which was, "Keep moving." For the time a solitary victim, he was not long left comfortless, and before the walk was half ended there were several "comrades in adversity." Many minds were exercised in the attempt to christen the spot with a fitting commemorative name, but the effort was abandoned in favour of a possible memorial in some elegant and enduring material. Later, however, the imagination was exercised with much fertility, as will be seen, in adding to the alliterative nomenclature of the neighbourhood.

Soon Herstmonceux Church came into view, and, after traversing a large number of nameless or unpronounceable fields, the party halted for refreshments at New Bridge about ten o'clock. The next place of note arrived at was "Snapson's Wall," a broad roadway between two dykes. Meanwhile Mr. E. Vine had proved himself the champion expert with the quont, and Mr. A. K. Burtenshaw but a novice. At least, he failed to clear one of the brooks, but had the misfortune to drop in shallow water. The "red gate," a well-known landmark on Mr. Pitcher's property between Hailsham and Pevensey, was reached at eleven o'clock. Mr. E. Vine's luck had meanwhile deserted him, for, endeavouring to negotiate an unusually wide stream, with Mr. Boniface's recumbent back as a "spring board," he had, owing to the treacherous mud at the bottom of the water, and the consequent instability of the pole, landed in mid stream, and got soaked to the waist. But if he had beaten the first "plunger" in regard to the depth of his bath, he was ere long eclipsed by Mr. Terry, who, at the dyke near the white bridge erected by Mr. Pitcher, was seen struggling up to his armpits in a dyke successfully negotiated by Mr. Thompson and Mr. Lade. "Terry's Tribulation" was the inspired designation of the scene of the catastrophe, as "Vine's Vicissitude" was that of the last mischance. Rickney was passed at 11.30, due note being made of the "H" and "P" built in brick in the cobble wall and signifying respectively Hailsham and Pevensey, and the proceedings were assuming an unexciting character, the talk degenerating into dissertations on agriculture, when another wide ditch stood in the way, in which the doctor, despising the friendly help of the quont, came to grief. The place is henceforth to be known as "The Doctor's Dip." At Marling Bridge, amongst others, the Rev. F. Clyde Harvey, vicar of Hailsham and chairman of the Parish Council, joined the party, and, essaying his first dyke with a too ready remembrance of his college days, and a reckless forgetfulness of the time that has passed since then, paid the penalty of his rashness by alighting just short of the bank, to the detriment of his nether garments. This was the last watery mishap of the day, and the spot is now known as "Vicar's Folly." One o'clock found the party at Polegate Station, and as the line runs between the parishes of Hailsham and Willingdon, this was unceremoniously crossed, much to the mystification of the passengers on the platform. Meanwhile the Rev. Clifford Aston and Mr. Tolhurst, two of the members for Polegate, had joined the company, who, by invitation, adjourned to the residence of the former and were entertained to a three-course lunch, which came most opportunely, and for which thanks were heartily, if informally, returned to the reverend gentleman.

The continuation of the boundary, which goes to a great extent along the main road, was then traversed. Regarding a slough, or "slow," in the locality of Cophall, Mr. Terry had received a memorandum, dated 1685, which the vicar had unearthed, declaring that the slough, "now known by ye name of Swine's Slow, lying and being in ye highway leading from Swine's Hill to Hailsham" (about which there had been a controversy) was "equally in both parishes, and yet the inhabitants of the said parishes are to joyn and be at an equal charge with Willmington in mending and repairing ye said slow . . . in witness whereof, and to prevent all trouble for the time to come betwixt the said parishes," certain parishioners, headed by the rector of Jevington (the Rev. William Carr) and the vicar of Hailsham (the Rev. John Wenham) "hereunto set their hands." The "beaters" returned to Hailsham High Street about four o'clock, agreeing unanimously that they had had a very pleasant experience. The great regret of the lay members' company was that the Rev. W. J. Clay kept his clerical cloth unsullied by a dip in

such unblest water. In the evening the ceremony of the day was celebrated by a dinner at the Crown Hotel, the vicar presiding.

ALGERIAN ALABASTER.

THE report of Consul-General Playfair contains the following information about the alabaster quarries at Ain Smara:—

A few months ago I received from M. Cantini, the well-known marble-worker of Marseilles, a letter in which he announced to me that he had discovered some ancient Roman quarries of what he believed to be the true Numidian marble, not very far from Constantine. This was accompanied by a series of specimens of the greatest delicacy and beauty, to which he had attached names, such as Lumachelle, Jaspe, Onyx, Brèche Africaine, &c.

I saw at a glance that these were not marbles at all, properly so called, but varieties of alabaster far more beautiful than the well-known Algerian onyx. After communicating my opinion to him I received a letter, of which I subjoin a few extracts:—

"I am happy that the specimens were interesting to you, and I retain your valuable appreciation of their beauty. I am sure that you will consider them marvellous if you can examine the specimens of them which we have at Marseilles. I have neither the pretension nor the competence to enter into a discussion with you regarding them from a scientific point of view, but you will permit me nevertheless to differ from you regarding their origin.

"It is my belief, and that of others of greater authority, that these, together with the marbles of Chemtou, are the true Numidian marbles. Of course it is well understood that formerly, as now, all beautiful materials capable of being polished and employed in the decoration of buildings were included under the general denomination of 'marble,' whether they were of aqueous or thermal origin, sedimentary or organic.

"These beautiful materials, for the most part stratified, are of infinite variety. Those marked V. and VIII. frequently contain pockets full of organisms, cemented together by heat and chemical action, which caused me to name them 'Lumachelles.'

"No. XI. is the 'Brèche Africaine dorée' of the Romans, and is really a breccia composed of calcareous masses and organisms cemented together by heat and chemical action. Regarding No. XV., it represents, badly perhaps, the beautiful oriental alabaster of the columns of the ciborium in the church of St. Paul Extramuros at Rome.

"Now, regarding the doubt which you have expressed as to their origin. My quarries, both the ancient Roman ones and those which I have recently opened, are situated in the province of Constantine, between Ain Smara and Le Guettar-el-Fich, almost on a direct line between Ain Smara and Sigus.

"St. Augustine and St. Cyprian speak in their writings of Christians condemned to work in the quarries of Sigus.

"They form a nest which extends over a superficies of 4,000 hectares, beyond which there is nothing but stone and schist. In the neighbourhood of Sigus there is nothing, absolutely nothing; I have searched through the country in every direction but I have found nothing.

"The ancient quarries which I have found are not more than 25 kilomètres from Sigus, and in a perimeter of that distance around Sigus there exists none other, not even a simple vein. Therefore these are indeed the quarries in which the Christians mentioned by St. Augustine and St. Cyprian were sent to work, in order that they might die more quickly in this unhealthy and feverish country.

"I repeat, these are assuredly and without doubt the ancient Numidian marbles, while those at Arzeu are separated from Numidia by Mauretania Sitifensis and Mauretania Cæsariensis. They are very beautiful, those Mauretanian marbles, but it is improper to call them Numidian."

I have searched in vain for any mention of the quarries of Sigus in the works of St. Augustine. In St. Cyprian's letters there is only one allusion to them, as far as I can ascertain.

Amongst his letters is one from the Confessors at Sigus, "Felix, Jader una cum presbyteris et omnibus nobiscum apud metallum Siguense," thanking him for his letter of consolation and encouragement. The saint's letter in question referred to church vessels, and he said, "What a strange thing it would be if you in the mine, which is the source of gold and silver, were given gold and silver vessels." The words, therefore, in the address, "Ad Nemesianum et cæteros martyres in metallo constitutos," clearly indicate a mine whence metal was obtained, and not a marble quarry.

M. Cantini admits that there are no other mines in the neighbourhood of Sigus, and therefore he concludes that his quarries—must certainly be those in which St. Cyprian's martyrs worked, and whence the far-famed "Marmor Numidicum" was extracted.

But there was another Sigus, or Siga, in Mauretania, the first capital of Syphax, before he transferred the seat of his government to Cirta (Constantine). This is close to the great iron mine of Beni Saf, and Baluzius, in his commentary on St. Cyprian's letter, says that Baronius (A.D. 260) believed that it was at the latter Sigus that the Confessors worked, to whom the saint addressed his letter.

This, however, is a matter of small consequence, as also is the assertion that these quarries only produce the celebrated Marmor Numidicum. Every owner of a quarry, whether here, at Arzeu, at Chennoua, at Filfila or at Chemtou, is fully persuaded that his are the true Numidian marbles. Probably all are quite right. It is very possible that the name was given to all the precious building material, whether marble or alabaster, imported into Rome from North Africa, without much regard being paid as to whether it was brought from Numidia or from the adjacent province of Mauretania.

I determined to visit these quarries and to form as accurate an opinion as I could regarding them. Ain Smara, the commune in which they are situated, is 18 kilometres south-west of Constantine, on the high road between it and Algiers. The quarries are 6 kilometres to the south-east of it, in a range of limestone hills of no great elevation.

As I had foreseen, there is no marble, properly so-called, in the district; both the Roman quarries to which M. Cantini refers and those opened out by him contain only alabaster. It is finely striated, and was no doubt originally deposited by water in a horizontal position and subsequently upheaved. The bands now occur at an angle of about 45 degrees, and vary in thickness from 1 to 6 metres. Sometimes they seem to traverse the limestone rock, and sometimes they are separated from it by a layer of red earth containing a certain amount of iron.

Some of the alabaster is almost colourless or of a faint yellow tint, resembling the well-known Algerian onyx of Ain Tekbalet. It is exceedingly delicate and translucent; blocks of great size can be obtained of this, and I am inclined to think that this will prove the most valuable product of the quarries.

Other varieties, still finely striated, have been stained with iron and present every colour, from white to primrose, passing into pink and deep red. In some instances the carbonate of lime seems to have been precipitated around nodules of varying size and form, following their outline in a most grotesque but beautiful manner; again water-worn pebbles seem to have been cemented together with lime, forming a beautiful conglomerate, not a true breccia.

The variety of design is infinite, and the only objection I can conceive for the employment of this variety is the impossibility of ever obtaining two blocks absolutely identical.

The formation of this alabaster is the same as that which may be seen going on every day at Hammam Meskoutin. Great volumes of boiling water, highly charged with carbonate of lime, rise from the earth, and as it cools the carbonate of lime is precipitated in the form of cataracts, cones or striated bands; some is pure white, corresponding to the onyx of Ain Smara, some is coloured by iron exactly like the varieties I have described. I brought away typical specimens, both of the ancient and of the recent formation, and it is hardly possible to distinguish the difference.

I am not able to express any opinion as to whether this alabaster is the same as that used in the church of St. Paul at Rome, but I can testify to its having been extensively employed at the great city of Timegad in Algeria. I have a distinct recollection of having noticed small fragments of it there twenty years ago, and on revisiting the ruins only a few days before I came here, I noticed that many fine slabs of it had been unearthed at the capitol there; they evidently formed a *placage* to the cella of that noble building, and there can be no possible doubt that they came from these quarries.

It is not fair to compare one beautiful thing with another. In some respects this alabaster is inferior to the marble of Arzeu, but it is hardly possible to conceive any ornamental stone more beautiful, and whether it is the Marmor Numidicum or not it has a value quite independent of tradition, and I do not think that M. Cantini has in the least degree exaggerated its beauty.

LICENSING ARCHITECTS IN NEW YORK.

THE following is the text of the Act which has been passed by the Legislative Assembly at Albany, and has therefore become law throughout the whole State of New York:—

An Act to regulate the practice of Architecture.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:—

Section 1. Within sixty days after the passage of this Act the Governor of the State of New York shall appoint seven persons from the New York State Association of the American Institute of Architects to constitute the New York State Board

of Architects, three of whom shall be appointed to hold office for one year, and four of whom shall be appointed to hold office for two years. Such appointments shall be made in writing, and be filed with the Secretary of State.

Section 2. Upon the expiration of the term of office of each member of the State Board of Architects, the Governor shall appoint his successor for a term of two years in like manner. Each member shall hold over after the expiration of his term until his successor shall have been duly appointed and qualified.

Section 3. Any vacancy occurring in the membership of the New York State Board of Architects shall be filled for the balance of the unexpired term in like manner. The members of the board shall serve without compensation or reimbursement for their services and expenses except as hereinafter provided.

Section 4. The members of the New York State Board of Architects shall, before entering upon the discharge of their duties, take and file with the Secretary of State the constitutional oath of office. They shall annually elect from their number a president and a secretary, who shall also be treasurer, to hold office for one year.

Section 5. The board may adopt rules and regulations to govern their proceedings not inconsistent with this Act. The board may adopt a seal, and the secretary shall have the care and custody thereof, and shall keep a record of all proceedings of the board, which shall be open to public examination.

Section 6. Five members of the board shall constitute a quorum, but the board may delegate the examination of applicants to a committee of less number to report the examination to the board.

Section 7. Special meetings of the board shall be called by the secretary upon the request of any two members by giving at least five days' written notice of the meeting to each member. The New York State Board of Architects may adopt rules and regulations for the examination and licensing of applicants for license to practice architecture in accordance with the provisions of this Act, and may amend, modify and repeal such rules and regulations from time to time.

Section 8. The board shall immediately upon the election of each officer thereof, and upon the adoption, repeal or modification of the rules and regulations for the licensing of applicants, file with the Secretary of State the name and post-office address of each officer, and a copy of such rules and regulations, or the amendment, repeal or modification thereof.

Section 9. Provisions shall be made by the State Board of Architects for holding examinations of applicants for license to practice architecture at least once a year if there shall be any application therefor, in each of the judicial departments of the State, and any person over twenty-one years of age, upon the payment of a fee of 5 dollars to the board, shall be entitled to enter any examination appointed for determining the qualifications of such license.

Section 10. If the examination of any applicant for license shall be satisfactory to a majority of the board, a license shall be issued to the applicant authorising him to practice the profession of architecture, upon the payment of an additional fee of 15 dollars. A person who shall at the time of the passage of this Act be engaged in the practice of architecture in this State, on presenting to the State Board of Architects an affidavit to that effect or a license from a similarly constituted board in another State, shall be entitled to such license without fee or examination. Each person licensed shall cause the same to be recorded in the clerk's office of the county of his residence, or if non-resident of the State, in the county in this State in which he shall have an office, and the clerk shall record the same upon payment to him of his fees at the same rate as for recording a deed. Upon every change of such residence or office from such county to another county in this State, the holder of such license shall cause the same to be recorded in like manner in the clerk's office of the county to which such residence or office shall be changed.

Section 11. The board shall keep on file in the office of the Secretary of State a corrected list of all licensed architects, for which purpose the Secretary of State shall keep a book wherein the full name and address shall be recorded. Any license so granted or obtained by affidavit may be revoked by the State Board of Architects for gross ignorance, recklessness or dishonest practices of the holder thereof, but before any license shall be revoked, such holder shall be entitled to at least twenty days' notice of the charge against him, and of the time and place within the county of his residence of the meeting of the board for hearing and determining such charge. The accused shall be entitled to a reasonable opportunity to produce his witnesses before the said board, and to be heard in person or by counsel in open public trial; and no license shall be revoked except upon the unanimous vote of all members of the board. The revocation of any such license may be reviewed by a court of record upon the application of any person aggrieved. If a person shall advertise or put out any sign, card or drawing designating himself as a "licensed architect" within this State

without a license therefor, in accordance with the provisions of this Act, he shall be guilty of misdemeanour.

Section 12. The license fees received by the board may be expended for the payment of the travelling and other expenses of the members of the board.

Section 13. An itemised account of such receipts and expenditure shall be kept by the secretary of the board, and a report thereof for each year ending with September 30, duly verified by the affidavit of the secretary of the board, shall be filed with the Secretary of State within sixty days thereafter.

Section 14. Any surplus of such fees exceeding 500 dols. shall be paid annually by the board to the Treasurer of the State.

Section 15. This Act shall take effect immediately.

LIVERPOOL ARCHITECTURAL ASSOCIATION.

UNDER the guidance of Professor Simpson, director of the School of Architecture and Applied Arts, the student members of the Liverpool Architectural Society paid a visit to the spring exhibition at the Walker Art Gallery. The visitors devoted their attention to the architectural drawings, an exhibition which Professor Simpson states has never previously been equalled. In the course of the review the Professor pointed out the qualities of execution in different drawings and the best means of achieving similar effects. He also drew attention to instances in which sculpture was intimately associated with architecture, as in the design by Mr. John Belcher for the building of the Institute of Accountants, London, and the same architect's design for the new South Kensington Museum. In reference to the drawings of interiors, he showed the effect and advantages of various styles of decoration, and especially of painting. The exhibition being especially rich in examples of Gothic and Elizabethan, these received considerable attention. A vote of thanks to Professor Simpson was cordially passed.

USE OF FOSSILS.

A SERIES of fossils may be looked at in several lights, all equally interesting. First of all they are the remains of many curious and interesting forms of animal and vegetable life that had never been seen living by the eye of man. They are thus interesting to the naturalist as coming in to complete the series of organic existences, and to fill up the gaps and lacunæ which are to be found in the gradations of organic beings now living on the globe. Secondly, they are interesting to the philosopher, and indeed to mankind generally, as not merely forming a portion of the great mass of organic existences, but as unfolding a history of events; as having an order of succession among themselves, proving that their several sets did not live promiscuously on the globe, but formed successive races of animals and plants, each race coming into existence, increasing and multiplying, occupying the length and breadth of the earth, and then gradually dying out to make room for their successors. They thus become records and documents of a history otherwise concealed in the depths of a remote eternity, and have well been likened to the medals of a race and a dynasty of which no other remnants have been preserved. Thirdly and lastly, they, in consequence of this succession, become of vast interest and importance to the practical geologist and miner; for as each particular set of rocks in a country is apt to be characterised by peculiar mineral substances useful to man, so we are enabled to recognise any particular group of rocks by the kinds of fossils it contains. The mere variety in the nature of the rock is not sufficient to tell us what group it belongs to, for limestones and sandstones, shales and clays occur over and over again in every group of rocks, and are often undistinguishable one from another. One little shell, or even fragment of a shell, the leaf of a plant or the scale of a fish is, therefore, often of far more value to the practical man than tons of rock specimens. In the search after coal, for instance, the rocks occurring at the surface in any particular portion of the country might be part of the group in which the coal is found, or they might belong to the group below or the group above the coal-bearing strata. In order to discover their exact position, and therefore to be assured of the chance of reaching coal below that part of the surface of the ground within a reasonable depth, the mere examination of the nature of the rock is often insufficient. The most practised geologist might be deceived by trusting to such indications alone, but if he finds in the rocks one of their characteristic fossils he is then on sure ground, and feels as absolutely certain of the relative position of the rocks as he would of the age of a coin bearing a legible impress and inscription.

The Clothworkers' Company have voted 500*l.* towards the building fund of the Royal School of Art Needlework.

"The Ten Virgins" in Lyndhurst Church.

SIR,—In your number for May 10 you criticise the mistake made by his Grace of Canterbury in speaking of this splendid work in my church at Lyndhurst as a panel painting "instead of a *fresco*"—a title in these days given popularly, but not wisely, to almost any mural painting. To the best of my recollection it is an "encaustic painting," in a process of gums and resins elaborated by the late Gambier Parry, and employed by him in his work at Ely. *Fresco*, or painting with fresh lime pigments on fresh plaster, is not often used in modern decorative work.

WILLIAM WHITE, F.S.A.

30A Wimpole Street, W.

[Mr. White's captiousness is always amusing. Apparently he is not aware that *fresco* has become a generic term, and comprises the process of spirit *fresco* introduced by Mr. Gambier Parry. This is no misapplication of the word originating with newspapers. *Fresco* was always employed in more than one sense. The late Sir Charles Eastlake, who was an undoubted authority, says that in the fourteenth century *fresco* was simply a preparatory process, the work being finished in tempera. Much variety existed also in the preparation of the walls, for many of the best *frescoes* are upon badly-constructed rubble, as at Florence and Bologna. Orcagna's great *fresco* at Pisa is painted upon laths, and we believe a wire netting was occasionally employed. In such cases uniformity in preparing the intonaco and laying on colours was hardly possible. There is also a wide difference between *buon fresco* and *fresco secco*, in which the intonaco is not fresh. Nor were lime pigments universally used, for they would not combine with colours derived from organic substances. As a long description and illustration of *The Ten Virgins* had already appeared in *The Architect*, there could hardly be an error in the reference to the subject on the 10th inst., but in a short note it appeared unnecessary to enter into details. The restriction is to be regretted, for it is evident from Mr. White's letter that if he had to fill the Archbishop's place at the Academy banquet his description of the President's work would be as hazy as his Grace's. We hope Mr. White's recollection is more assured in other matters connected with the Lyndhurst Church. His letter will not be encouraging to painters and sculptors, for it suggests that architects and ecclesiastics are alike in their forgetfulness of co-operation for which they ought to be grateful.—ED.]

GENERAL.

A "Breton Fair" is to be held at Shoreham in September, to raise funds for the restoration of the tower of the parish church.

The Report of the Society for the Preservation of Ancient Buildings on the restoration of the Cross at Chichester has been referred for consideration to a committee.

The Chilian Parliament House was destroyed by fire on Saturday last week, with the archives and library. The loss amounts to 400,000*l.*

Mr. G. F. Watts, R.A., has subscribed 1,000 guineas towards the endowment fund of the Home Arts and Industries Association. The annual exhibition of works will be held on June 13.

The Improvements Committee of the London County Council have asked for authority to prepare a scheme for the formation of a new street from Holborn to the Strand, subject to the condition that the betterment clauses of the Tower Bridge Bill shall be applied.

Four Palaces in the Politeama Adriana, Rome, which adjoin, have been seriously damaged by fire. The King of Italy was present during the efforts to overcome the flames.

M. Louis A. Barye, the sculptor, died at Montrouge a week ago in his fifty-sixth year. He was the son of the famous *animalier*, whose works were never surpassed.

The Municipal Council of Paris will have to contribute in the course of the year towards the exhibition of 1900 a sum of 20,000,000 francs.

A Portrait of Mary of Guise, which appears to be an authentic likeness, has been presented to the Town Council of Edinburgh by Colonel Mackay.

The Argyll Memorial and Window in St. Giles's Cathedral, Edinburgh, will be unveiled on Monday. Messrs Mitchell & Wilson are the architects.

The Architect.

THE WEEK.

It was generally understood that Professor ROGER SMITH was engaged on an enlargement of his book on "Acoustics in Relation to Architecture and Building," which was one of the most useful of WEALE's series. But owing to his engagements all that the Professor has been able to do is to revise the text in a few places, and to introduce some additions relating to recent appliances for the transmission and development of sound and the remedying of acoustic defects. Thus it is pointed out among other things that "the shape of a ceiling has perhaps more influence than any other part of a hall or room upon hearing than any other feature." Coves do not appear to be advantageous, and it is said that in the Queen's Hall, Langham Place, the risk which arises from them is skilfully avoided by connecting the ceilings to the walls by a surface that is to some extent convex. That low ceilings are favourable to the propagation of sound is exemplified by the success of "the temporary buildings erected in different localities for the public services of Messrs. MOODY & SANKEY, occupying as much as half an acre, and accommodating probably upwards of 4,000 people." The book was based on a paper in which, like others by the author, no trouble was spared to elucidate the subject. It has been to many the most useful book of its class, and it is as competent as before to yield precise information to students as well as their masters.

THE late Mr. HENRY SUMNERS, who died on the 23rd inst. in his seventieth year, had gained a large architectural practice in Liverpool. Among his buildings are the following:—The Greek Church, Prince's Road; Royal Southern Hospital, Liverpool Stock Exchange Buildings, St. Helens Town Hall, Cowley Schools, St. Helens; Christ Church, Linnet Lane; Peter's Buildings, St. Cyprian's Church, Edge Lane; St. Lawrence's, Kirkdale; St. Athanasius, St. Philemon's Mortuary Chapel, Collingwood Street; Baptist Chapel, Prince's Road; Royal Liver Offices, Royal Court Theatre, Liverpool Exhibition Buildings, Walton Workhouse and Prescott Workhouse. He was also engaged in the alterations to the Washington and Grand Hotels, Lime Street, and acted as consulting architect and agent in England for the Prince Alfred Hospital, New South Wales. Mr. SUMNERS gave attention to the subject of street improvement in Liverpool, and illustrations of one of his projects are now in the exhibition at the Walker Art Gallery.

THE Mitchell Library, Glasgow, should have been built with elastic materials, for more and more expansion appears to be required as time rolls on. The condition of the new premises recalls what used to be stated about the old building. In the last report, Mr. BARRETT, the librarian, says:—"It is perhaps a little disconcerting to find that, in the first general report following the removal of the library into the new premises, it is necessary to state that these are already too small for the number who desire to enjoy the advantages the library affords. But the condition of the rooms during a large part of 1894 forbids the hope that any further development can be attained without a considerable increase of accommodation. There are, of course, times when the rooms are far from full, but at the periods of maximum attendance the resources of the institution are severely pressed. It is a comparatively frequent occurrence to count in the principal reading-room from thirty to sixty persons in excess of the number of seats. Readers may be seen sitting on and below the circular stairs, standing in the passages, maintaining an uneasy balance on the base of the rail, and even prone on the floor—truly a pursuit of knowledge under difficulties." If the additions to the books continue to be at the rate of over 7,000 a year, the shelf-space will soon be exhausted. During the past year no less than 519,196 volumes were issued,

and as 115,788 related to arts, sciences and natural history, being nearly double the number of volumes of fiction, it is plain that many of the readers are engaged in serious studies.

AMONG the seventeen plays of PHILIP MASSINGER, "A New Way to Pay Old Debts" alone is considered to be worth representation, and of late years it is losing its hold over provincial audiences. "The Fatal Dowry" ceased to be an acting play when Lady MARTIN left the stage, and as PHELPS has no successor, "The City Madam" is also doomed to exclusion from theatres. In spite of his failure to retain the least sway over playgoers, MASSINGER's works should not be overlooked. He was one of the band of hacks who laboured in the garrets of Southwark in the early part of the seventeenth century, and who were unknown to all except the players, who looked down on them, and the fashionable dramatists who condescended to accept the credit for their productions. The description of MASSINGER as "a stranger" in the burial register of St. Saviour's, a parish in which he lived for about twenty years, summarises the history of many a man of genius at that time. An endeavour is now being made to erect a memorial window to PHILIP MASSINGER in the church where his remains rest, with those of JOHN FLETCHER, with whom he co-operated, and other worthies who aided in the creation of Elizabethan literature. He was purer than most of his contemporaries, for the occasional passages which spoil his plays are to be ascribed to other hands. GIFFORD and HALLAM did not hesitate to place MASSINGER next to SHAKESPEARE himself. If later scholars have not endorsed that opinion they have certainly agreed to give MASSINGER a very high place among the Elizabethan dramatic writers, and it can hardly be doubted that when the endeavour to commemorate his work in the church where he is buried is more fully known to lovers of English literature, an adequate response will follow.

A PRAYER-BOOK measuring 3 inches by 2 inches has been acquired for the Emperor's library, Vienna, which is considered to be a priceless treasure. It belonged to Prince ERNEST, the son of MAXIMILIAN II., and the brother of RUDOLPH II. It was, therefore, produced towards the end of the sixteenth century, and the twelve illustrations, which are exquisitely drawn with a pen, are in a style which GOLTZIUS might have admired and imitated. The borderings on each page reveal that the delicacy of the Mediaeval illuminators had not entirely vanished from Europe. The Archduke ERNEST died in Brussels, where he was viceroy, in 1595, and it was in that city the tiny work was obtained.

ANOTHER attempt is about to be tried to remove one of the eyesores of Paris. The building on the Quai d'Orsay, which prior to 1870 was known as the Cour des Comptes, was destroyed during the Commune. The smoke-stained ruins were allowed to remain, while in other parts of the city similar evidence of the passions of the populace were removed. Some years ago it was arranged that the Union des Arts Décoratifs were to erect a museum of the South Kensington type, and a lottery to raise funds was unusually successful. But through the mismanagement of the committee the project collapsed. It was well there was failure, for the building would be too remote from the industrial quarters of Paris. It is now proposed to erect a building which will again be assigned to the Cour des Comptes. French architects are invited to send in designs for the reconstruction. The drawings are to be deposited on August 31. They will be examined by a jury composed of the Minister of Public Works, the President of the Cour des Comptes, some senators, deputies and officials, with five architects to be nominated by the competitors. The first prize will be 7,000 frs., the second 5,000 frs. and the third 3,000 frs. There will be also five prizes of 2,000 frs. each. The area is to be limited to the old boundaries. The principal façade to the Quai d'Orsay, the façade to the Rue de Lille, and that facing the interior court are to correspond with those destroyed. There will consequently not be much scope allowed for invention in the exterior of the building.

COPYRIGHT IN DESIGNS.*

IT needs only a superficial view of any of the objects in shop windows and catalogues marked "design registered" to realise that English law is indifferent to beauty or suitability of form, and that absurdities can be secure of protection under its ægis. As there are schools in which design is taught at the public expense, it is natural for some people to suppose there is a connection between design in the lawyer's and manufacturer's sense of the word and the artist's. It is not the fault of the legislature if anybody is misled. The statutory definition of design in the Act of 1883 is sufficiently comprehensive to comprise worse degradations of human ingenuity than used to be seen in the old Chamber of Horrors at Marlborough House. According to section 60, "*design*" means any design applicable to any article of manufacture, or to any substance artificial or natural, or partly artificial and partly natural, whether the design is applicable for the pattern, or for the shape or configuration, or for the ornament thereof, or for any two or more of such purposes and by whatever means it is applicable, whether by printing, painting, embroidering, weaving, sewing, modelling, casting, embossing, engraving, staining, or any other means whatever, manual, mechanical or chemical, separate or combined." The legal net is so wide-mouthed that the most amorphous things can get into it, and thereby are on an equality with forms and arrangements which are the creations of men of genius.

In a story by the late Miss METEYARD we read of a designer who, having received a commission for an ink-stand, and being anxious to produce something beautiful, begged of an astronomer to allow him to pass his nights in the observatory watching the stars until inspiration came down to him. In the eyes of the law that masterpiece (assuming it to exist) might have to succumb to some trumpery piece of manufacture brought out a little earlier, which the courts considered bore a slight and accidental resemblance to it, and the sidereally inspired work dare not be sold under a penalty. For it is not form or fitness of purpose or even rationality in the arrangement which guides the judges, it is merely a question of novelty. Baron POLLOCK once laid down the principle in the following remarkable words:—"A man might register a design for a doorway made with bronze, and made with a figure of the APOLLO BELVEDERE, that might or might not be better or worse than a doorway that had preceded it; but it would be foreign to the question altogether whether it was properly the subject matter of a design and whether it was new as a design under this Act, although it had none of those advantages. The only question then would be this, You must use your eye and say, looking at the figure or the design, whether it is new or it is not, and beyond that you cannot go."

It must be understood, too, that to be new does not mean novel in form. There is really no need of invention to become a designer in the legal acceptance of the word. The present is a week of racing, and losers may be glad to learn that if one button bear a representation of a jockey and another will show a horse, then if on a third horse and jockey are combined (it is not necessary to put the rider in the saddle), according to Mr. Justice COLERIDGE a new design is created. It is quite possible the made-up design would be preferred by the public and become more profitable than one modelled by Mr. WATTS or Mr. BROCK. The honeycomb pattern has as little novelty about it as the circle; a "designer," however, once placed large honeycomb cells as a bordering to smaller honeycomb cells. An English jury found the design to be new and original. The verdict was set aside by the Court of Exchequer, but it was upheld on appeal. Mr. Justice WIGHTMAN stated on the occasion, "It was said by one of the learned judges of the court below that the constituent parts of it were old and the novelty was only in the arrangement or combination. Why? A picture which contains within it a novel combination of old parts is a new drawing, and it seems to me if no one else has ever combined them in the same manner, it would be a new design within the protection of this Act of

Parliament." Academicians who so humbly implore the presence of judges at their banquets must be flattered by the judicial notion of pictorial composition. Let us take another example which has become a leading case. For some mysterious reason there are not many varieties of patterns of spoons. The fiddle pattern, king's, thread, rat-tail, and beaded have possession of the English market. A brilliant idea was conceived by a manufacturing firm. They resolved to supersede all the accepted patterns by a new spoon, and of course a fork was included in the scheme, on which Westminster Abbey appeared. It appears "the registered design consisted of the shaft of a spoon, and on the top of it a representation of Westminster Abbey seen from a particular point of view; the two towers and the pinnacles were there, and the transept with buttresses." As was to be expected the courts decided in favour of the novelty of the design. The view was taken from a photograph, and we suppose somebody interested in the rat-tail or other monopoly suggested that at least there ought to be an adaptation of a subject to fit a space in order to constitute a design, but the late Lord Justice BOWEN scouted that theory. The legal and legitimate theory was thus expressed by his lordship:—

The novelty may consist in the applicability to the article of manufacture of a drawing or design which is taken from a source to which all the world may resort. Otherwise it would be impossible to take any natural or artistic object, and to reduce it into a design applicable to an article of manufacture without also having this consequence following, that you could not do it at all, in the first place, *unless you were to alter the design so as not to represent exactly the original*; otherwise, there would be no novelty in it, because it would be said the thing which was taken was not new. You could not take a tree and put it on a spoon, unless you drew the trees in a form in which a tree never grew; nor an elephant, unless you drew it and carved it of a kind which had never been seen. An illustration, it seems to me, that may be taken about this is what we all know as the Apostles' spoons. The figures of the Apostles are figures which have been embodied in sacred art for centuries, and there is nothing new in taking the figures of the Apostles, but the novelty of applying the figures of the Apostles to spoons was in contriving to design the Apostles' figures so that they should be applicable to that particular subject matter. How does a public building differ from that? In no sense, it seems to me, and the photograph of a public building does not differ.

It was held by Vice-Chancellor MALINS that a copy of a portrait of a public character applied upon earthenware was not a new and original design, but that decision is not accepted as authoritative. The courage that was exhibited in converting a portrait to base uses would now be considered by the courts as identical with designing power. We have, in fact, in the decisions about designing another instance of the anarchy that prevails in English institutions. The public pay in the art schools for laying down doctrines, about avoiding direct imitation in industrial design and the necessity of transformation in the forms to give them fitness, while in the courts the judges are paid to expose the foolishness of such doctrines. To the minds of the judges mere form is of less consequence than priority of use. A man made a china lampshade in the shape of a rose, but it was declared to have no novelty, because there was registered an earlier shade in linen formed like a rose. But he could have legally applied the identical form to many other uses if he pleased. This was shown by a decision in the case of an iron company that introduced a door with a moulding on the top in a range. Lord MURE, in his judgment, said:—"There is evidence to show that such a door as this was not unknown in certain kinds of doors; but I am quite clear, upon the evidence, that it was new as applied to kitchen ranges." The change in purpose was sufficient to establish the design, and probably the more remarkable is the incongruity the more deserving it is of protection. This conclusion is suggested by what Lord Justice LINDLEY said in the Westminster spoon case:—"If you ask whether anybody has previously taken this particular aspect of Westminster Abbey and used it as a design applicable to things in Class 1, or to any things like it, the answer is, 'No, that is new, and never has been published before.' That answer seems to me to bring the plaintiffs' case within the Act of Parliament." It did not seem to come within his lordship's province to suppose that the avoidance of the use of Westminster Abbey by generations of spoonmakers was evidence of unsuitability, and that as such a *motif* could not be considered as eligible by men who were competent to judge, it did not come

* *The Law of Copyright in Designs.* By Lewis Edmunds, D.Sc., LL.B., assisted by T. M. Stevens, M.A., B.C.L., and Marcus W. Slade, B.A. Sweet & Maxwell, Limited.

within the terms of the Act if an equitable interpretation were employed. We must, however, remember, as an excuse, that in technical cases judgment is given in words which are not defined by lawyers in the same sense as by practical experts, and hence it must follow that inconvenience occasionally arises.

There is no doubt that English manufactures would be elevated in character and be more esteemed throughout the world if less indifference to design, using the word in its ordinary sense, were exhibited in Acts of Parliament. The legislature is undoing the work of the art schools when it sanctions ugliness, vulgarity and unfitness. A country which unblushingly adorns its spoons with views of abbeys, puts the doors of Greek temples on kitchen boilers and makes lamp-shades like full-blown roses, gives opportunity to its foreign rivals to make little of its capacity. One of the causes of the indifference which is doing so much harm to English trade probably arises from the difficulty of realising what is being done in every term. It seems incredible, in spite of the array of law books, that, prior to the appearance of the volume in the production of which Mr. LEWIS EDMUNDS was aided by Mr. STEVENS and Mr. MARCUS SLADE, "no work specially devoted to the Law of Designs, and attempting a complete treatment of the subject, has appeared for many years past," and that "such scanty treatment as the Law of Designs has received at the hands of legal writers has generally been incidental to the treatment of other subjects." The anomalies which arise are therefore not likely to be made known to the press, which is still the pioneer in the reform of abuses. The volume on the "Law of Copyright in Designs" will therefore be advantageous if, directly or indirectly, it affects public opinion, and leads to a more satisfactory system.

But the law as it exists causes grievances besides those which arise out of the disregard for æsthetics. The procedure that is indispensable is full of pitfalls for the unwary. Thus, a design may be registered in one class and legally pirated in another class. The registration of a design may be refused by the controller at his discretion, and "there is no restriction as to the grounds upon which the refusal may be based." Where marking is necessary, a slight oversight is likely to be fatal to copyright. In one case mentioned a manufacturer of room-papers stamped every piece with the proper mark. But patterns which were cut off the pieces were not all marked, and it was decided that the Act was not complied with. In another case of trimmings, an attempt was made to show that the little units should all be marked. Mr. Justice KEKEWICH decided that if the proprietor sold the trimmings in pieces of 144 yards, they must be marked, and if he sold them in small pieces for patterns or for use, they must equally be marked by a label or printing. A design for dusters was registered. Twelve dusters were produced in each piece, and there was a gummed label on each piece bearing the proper mark. But it was held by the Vice-Chancellor there were twelve articles in each piece, and therefore the marking was defective. As regards infringement, it is not a difficult nor an unsafe operation to a specialist. The late Master of the Rolls said that a fair imitation of an original kind was not an infringement, and the words can be interpreted liberally. According to Lord WESTBURY, "When a pattern is registered as a whole, anything which is a facsimile is an infringement, anything which produces it in its integrity; but that which is different in shape or form, or in the relative positions of the different parts, which is not a reproduction of it, would not be an infringement." Nor is the penalty for infringement always heavy enough to deter. In the Westminster spoon case, which is illustrative of so many points in copyright, all that was inflicted was twenty shillings in each of the two cases. According to the Act, the infringer is liable to forfeit to the registered proprietor of the design a sum of fifty pounds for every offence, but the Courts are not disposed to accept the words literally and inflict a fine of fifty pounds for every tile or spoon produced. But the proprietor can bring an action to recover a sum equal to any loss he may have sustained.

The procedure of registration is not without inconvenience, and it may lead to actions and losses. But on the whole the results in sterling coin are worth the trouble. Thanks to the official system, exceptional artistic power is no longer needed to attract fortune. Registration is the

most effective process yet devised, or that could be devised, for putting bad and good, sane and insane, designs on the same footing. That is equitable, for the foolish design pays as much to the State as the finest. The multitude of people in this country are no more competent to distinguish between suitable and unsuitable designs, or to judge of ornament, than they are to analyse the stuff employed in patent medicines. In both classes of productions they take an official mark or stamp as evidence of value, and as long as the Exchequer is enriched nobody cares how much harm may arise. The judges are, therefore, acting in the proprietor's interest when they insist that registration marks shall be definite, for they are like the hall-mark on gold or silver. The more medicines and designs brought out the more satisfactory will be the financial returns, and the supporters of the party in power then rejoice. If a similar stimulus to the patriotism of the Greeks were offered in the old days, probably they would not be satisfied with a very few varieties of ornamental forms which the artists refined instead of superseding. Government is now more costly than in Athens, and by the law of compensation inventiveness is increased to an extent that is without precedent.

However, we must take Government as we find it, with its shortcomings. At least the producers and proprietors of designs which are worthy have a right to be protected, for every application, appeal, notice and request means an addition to the revenue, and it is well that information should be available which will enable them to guard against piracy. This has been done, and well done, by Mr. LEWIS EDMUNDS. His book might be called "A Guide to the Patent Office," for as much importance appears to be attached to what takes place in Southampton Buildings, as in the courts of law. It is not often a barrister is discoverable who is so painstaking in making all things clear for laymen. Mr. EDMUNDS's "Copyright in Designs," can, therefore, be recommended as an invaluable monitor in all offices where industrial designs are produced, for attention to the instructions may often safeguard a valuable property against the enemies who flourish by taking advantage of oversights.

JAMES BARRY, R.A., ON ARCHITECTURE.

IT could not be doubted by any of his contemporaries that the organ of combativeness was largely developed with JAMES BARRY. The portrait of himself which he introduced in one of his big pictures in the room of the Society of Arts represents him as seated humbly in a corner, and looking towards the spectator with the wistful eyes of a man who was destined to be deprived of his due measure of appreciation. But the panel he holds in his hand has on it a very unworthy figure which he painted as a type of Royal Academicians, and by which he wished to suggest that in his opposition to them he resembled HYPERION against a satyr. BARRY could not cease to be contentious when producing works that were unique as examples of the noblest self-sacrifice. All through his life he was militant, and it must be said that when he was most extravagant and inconvenient to other men, he believed he was contending for what was right and true. His aspirations as an artist were always after the sublime (as it was understood in the latter half of the eighteenth century), and in his conduct he imagined he was following the examples of saints and martyrs, or it may have been of PLUTARCH's heroes. The well-known words which his patron, EDMUND BURKE, employed in a letter of advice, suggest how well he was acquainted with BARRY's peculiarities, in believing that his actions could not be wrong because his intentions were unselfish. His wise words are worth repeating, for they cannot be too well remembered. "Believe me, my dear BARRY," said BURKE, "that the arms with which the ill-dispositions of the world are to be combated, and the qualities by which it is to be reconciled to us and we reconciled to it, are moderation, gentleness, a little indulgence to others, and a great deal of distrust of ourselves, which are not qualities of a mean spirit, as some may probably think them, but virtues of a great and noble kind, and such as dignify our nature as much as they contribute to our repose and fortune; for nothing can be so unworthy of a well com-

posed soul as to pass away life in bickerings and litigations, in snarling and scuffling with everyone about us." There are no doubts expressed by BURKE about BARRY's ability or his industry. However disputatious he might be in Rome or elsewhere, his studies were not neglected. When he returned to London in 1770 BARRY was unquestionably the ablest figure draughtsman in England. He was then in his twenty-ninth year.

There were no patrons awaiting him. But he was prepared to show his belief in the maxim that was so often on his lips, "No cross, no crown." If only the plainest fare, clothes and a lodging were provided for him, BARRY was prepared to paint the most difficult works. The practice of art was to him "an exceeding great reward." He had not long arrived before he offered to co-operate in the decoration of St. Paul's. The scheme was not approved. At a subsequent time he was more happy, for the Society of Arts accepted BARRY's offer to paint gratuitously the great room in the house in John Street, Adelphi, with a series of pictures which would demonstrate that the happiness of mankind is promoted in proportion to the cultivation of knowledge. He was afterwards compelled by his poverty to solicit permission to have the series exhibited to outsiders on payment, and in that way he received about 500*l.*, to which the Society added 200*l.* On that money he lived during several years. He was appointed professor of painting in the Royal Academy, but BARRY was one of those men who believed that the repetition of the same course of six lectures year after year would not make great painters. He tried to alter the arrangements, and wished to secure all the aids and appliances which the students required. He was outvoted, and as he would not abandon his efforts on behalf of efficient training, he was expelled from Somerset House. BARRY was one of those heroes whose best memorial is the list of their failures.

It is necessary to sketch BARRY's character in order to understand how he came to speak about architecture. In his Academy lectures he treated of the art in some of its relations to painting. But at an earlier period, and soon after his arrival in London, he presented some novel views about architecture in his "Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England." The production of a work of the kind was characteristic of the man. By the "imaginary obstructions" BARRY signified the fatalistic philosophy which was in favour at the time, and according to which, by a law of nature, Englishmen were not furnished with any of the ability which was necessary for all those who would follow the fine arts. The condition of patronage was enough to give a sort of plausibility to a theory of that kind. The dealer then, as now, was the arbiter of taste, and dictated what was to be purchased and what was to be neglected. In our time fortunately he finds it more profitable to traffic in the works of living artists. In the eighteenth century most money could be made by the discovery, purloining or fabrication of Classic "antiques" or Renaissance masterpieces. BARRY was familiar with all the mysteries of dealing. He appeared so poor and powerless that he was allowed to see and hear all that took place in Italy. He discovered that DA VINCI's *Last Supper* was repainted by an Irish monk, so degraded was the state of art in Italy, and in the purlieus of Rome he beheld stranger operations. BARRY had to put some restraint on his revelations, and in one place he apologises for his want of faith in the connoisseurship of people who were distinguished by rank and fortune. But he informs them that "it would be endless to give an account of all the various ways in which our antiquaries and picture-dealers, with their whippers-in and dependents, both at home and abroad, carry on this business of imposition; let it suffice to say, that it is the most difficult thing in the world for any travelling gentleman who may be inclined to purchase, to avoid the springs and the nets that are so artfully laid there."

It was notorious how much money was expended every year by Englishmen on works by artists most of whom never heard of in England. Rich men in other lands were not overcome by a similar weakness. It was therefore allowable for theorists about things in general to conclude that English patrons were forced to purchase foreign works because there were no native artists to produce pictures or statues. It was the business of the old logic to uphold

fallacies, and EUCLID was not more rigid in his conclusions than MONTESQUIEU when he demonstrated that, in consequence of their climate, Englishmen were in a perpetual state of dislike for all things, including life itself; that, owing to the prevalence of north-easters, the fancy of poets was sickly and oppressed, and that even the liberty of the people was due to their disposition towards suicide, since it was as easy to get quit of life in opposing a tyrant as in dying in one's own chamber. There were martyrs enough among the English artists and writers to support every theory about English indifference to arts and letters. Any philosophic Frenchman who saw BARRY going about in an old green baize coat and feeding in cook-shops, or observed Dr. JOHNSON treasuring up orange-peel, or was astonished at DICK WILSON's waistcoats made out of his landscapes, would be disposed to say there was not much difference between the possessors and the claimants for patronage.

If the philosophers had asserted that motion of globular objects was impossible in England owing to the density of the air, it might be difficult to disprove what was said by any force of logic, but a practical demonstration was within the reach of all. BARRY need only have referred to works of art produced by his contemporaries, and his case was gained. They were not forthcoming. REYNOLDS's or GAINSBOROUGH's portraits, WILSON's landscapes which were lying rolled up in garrets, HOGARTH's moral satires, were not the kind of works which would overwhelm foreigners and bring them to conviction. BARRY was, therefore, compelled to adopt a roundabout process of argument—to go back to the time of HENRY VIII. and trace all the neglect of art to his misgovernment; to investigate atmospheric phenomena, in order to discover the influence of climates; to inquire into the effects of education, religion, &c.; to compare the bodily structure, and so on, in order to excuse that indifference by which he was compelled to suffer. Before his time martyrs had prayed for their enemies, but JAMES BARRY was the first who composed a treatise to palliate the offences of those who were depriving him of life.

His remarks on architecture arose out of the desire to vindicate England. Every man of taste at that time believed that the Gothic buildings were barbaric, and were productions which were enough to warrant all the conclusions about the impossibility of producing noble works of art. The weakness for them testified that the English were to be included among the family of Goths, who were the destroyers of that ancient civilisation which no efforts could revive. BARRY disliked every Gothic form, but he would not allow any one to say that the style was a northern product. He boldly took an opposite view. "The manner of building called Gothic," he says, "is vulgarly supposed to have been the invention of the Goths, and that it was carried into Italy by those barbarians after they had established themselves upon the ruins of the Roman empire; but the contrary was the fact. It had its birth in Italy, and it crossed the Alps in company with all the other declining arts, which were happily preserved by the friars and other religions, and which they transplanted into the Gothic kingdoms. There are no proofs that the northern peoples had any species of architecture at all before their intercourse with the Romans, or that their habitations were other than holes in the earth, or at best built of wood, mud and chaff, as is still practised in some parts of our islands. The beginnings of Gothic architecture are traceable in those buildings erected in Italy before the arts were much declined and long before the Goths had any footing there." BARRY was able to support his theory in a way that was creditable, for we believe he was the first to realise that Gothic derives its character from its roofing. He saw "in the second arcade of the second floor of the Amphitheatre of TITUS," and in the Baths of DIOCLETIAN, examples of vaulting "meeting in a point in the centre of four pillars as the arcades cross one another." At Hadrian's Villa he observed "the same sort of roof, where the four sides of the vault meeting in a common point in the centre of the roof, each side gives to the eye exactly the appearance of the Gothic pointed arch, although they are in reality made up of two half circles crossing each other." When the central points are raised, as in the church of the Minerva and elsewhere in Rome, there is, he says, exactly the

Gothic roof. The prototype of the clustered column he believed he saw in two columns in the Pantheon, in which the fillets between the deep fluting have on them a semi-circular moulding. Gothic capitals he derived from the Corinthian. But ornament obtained in that way, although it might have a merit of its own, could never be comparable with Greek work. As he said, "the great difference between the Grecian ornaments and all others is, that the Grecian taste for embellishing grew up amongst them whilst they were cultivating all the sciences and when the arts of design were in perfection. Their philosophy, eloquence, poetry, painting, sculpture, music, &c., made one mass of education, and reflected light and improvement upon each other. The graces were the production of this joint effort, and architecture, which has not any archetype in nature to direct and govern its embellishments, became ornamented by emanations from that stock and order which resulted from the united exercise and knowledge of those arts that had, and, like another PANDORA, the Grecian architecture was decorated with gifts from the gods." When arts and sciences were again unified in England, no less satisfactory a consummation would be reached.

The progress of the century and a quarter since BARRY wrote would be satisfactory to him if he were alive, for the artistic power and patronage which he could not see is now forthcoming. A philosopher of our time would be laughed at who endeavoured to make out that in the bodily frame of Englishmen there was so much heaviness as to make it impossible to attain the level of other nations in art. In how many contests has the contrary become manifest? While so much is evident it is well to remember those who, in spite of their own trials, had faith in the ability of their countrymen, and among them must be numbered the genius some of whose speculations we have endeavoured to explain.

THE INSTITUTE OF ARCHITECTS' ELECTION.

A MEETING of Associates of the R.I.B.A. was held on Monday, May 27, at 8 P.M., at Dr. William's Library, Gordon Square, W.C., to consider the replies received from candidates for the R.I.B.A. Council to the following letter, and to consider the desirability of electing a permanent associates' committee:—

"May 20, 1895.

"Dear Sir,—We, the undersigned Associates, are anxious to obtain your views upon the question of the qualification for the Fellowship of the Institute, and we should, therefore, take it as a great favour if you would be so kind as to forward a brief reply to the following question to Mr. H. V. Lanchester, 12 Great James Street, W.C., before Friday next.

"Are you in favour of restricting the Fellowship of the R.I.B.A. to (1) Associates; (2) other architects who were in practice before 1880, and (3) those whose work is of exceptional merit.

"In the case of the latter would you advocate that photographs of their executed work should be exhibited in the Institute rooms for one month before the election?"—We are, yours obediently,

London.

T. C. Agutter, E. Milner Allen, John Anderson, R. S. Ayling, Roger F. Bacon, R. Shekleton Balfour, Ernest R. Barrow, Sydney B. Beale, John Begg, T. H. Bishop, Arthur J. Bolton, T. Gardhouse Charlton, Arthur W. Cooksey, Henry A. Crouch, Erskine S. Cummings, Langton Dennis, Owen Fleming, B. F. Fletcher, Geo. McLean Ford, William A. Forsyth, James S. Gibson, William Grace, William D. Gravell, Sydney K. Greenslade, Geo. Harvey, Walter S. Hewitt, Francis Hooper, Leonard V. Hunt, J. A. R. Inglis, Harry Jefferis, W. Ed. Johnson, D. W. Kennedy, Geo. Kenyon, H. E. Kirby, H. V. Lanchester, Allan J. Meacher, John Murray, J. E. Newberry, James Paxton, Thomas A. Pole, Percy Pratt, Andrew W. Prentice, Harry W. Pye, T. Duncan Rhind, S. B. Russell, Henry A. Saul, Edgar H. Selby, John W. Simpson, J. C. Stransom, W. T. Tapper, Arnold A. Taylor, A. H. Ryan-Tenison, F. W. Troup, Sydney Vacher, W. H. Ward, Robert Watson, W. Arthur Webb, Fredk. Ernest Williams, Ernest A. E. Woodrow, E. W. M. Wonnacott, J. B. Mitchell Withers.

Provinces.

Charles E. Bateman, W. H. Bidlake, Harold Brakspear, Jno. G. Dunn, Alfred Hale, T. R. Kitsell, Henry J. Lanchester, Herbert R. Lloyd, H. L. Paterson, Alfred Reading, G. O. Scorer, James R. Wigfull, Arthur Needham Wilson.

Mr. Owen Fleming presided, and about 58 attended, this number including candidates for the R.I.B.A. and 30 Associates. Twenty-six supported questions No. 1 and No. 3. No one present supported question No. 2, but 25 supported No. 1, No. 3, and the subsequent question, a rider to No. 3. A number of letters from prominent architects were read in favour of questions 1 and 3, and most of them included No. 3. Considerable time was taken up in discussion, with the result that it was determined at present only to form a committee of Associates, R.I.B.A., to look after the interest of the juniors, and 19 were elected members of the committee. The proceedings terminated with a vote of thanks to the chairman.

TESSERÆ.

Expression in Architecture.

THE term "expression" came into use with descriptive writing about art, and is freely applied to creative work of all kinds. Pull the word to pieces and you get *ex*=out of, and *primere*=to press or squeeze out, to declare, utter, signify. Now, in one sense, there is hardly any object devoid of expression, if the term be taken as covering some differential external quality, as in a ship, or animal, or tree. But in respect of art the word is employed in a higher sense, rather as revealing some unique internal quality. And here the thing signified is almost as hard to define as the flavour of a fruit or the odour of a flower. Here we mean by the word the pervading grace, the special quality of attractiveness, the unique character of poetic interest that the poem, or picture, or building has. From whence comes this poetic interest? Wherein lies the secret of its charm for us? Art of all kinds comprehends the forms in which men of genius utter what is in them. Art is the speech of poetic minds, and a work of art acquires its poetic interest by the simple fact that the artist has pressed out of his imaginative self the master qualities of his mind, and imparted these to his work. The thing speaks for the man and of the man. Hence the adage, "The style is the man." There is always found in the work of a man of genius an emotional quality of style which gives us so much more than the outward garb of the thing.

William Hogarth.

Hogarth has been called "a writer of comedy with the pencil," but there is much more of the deepest tragedy in his works. Most of his subjects are entirely of his own invention; and in the story of what may be called his dramas, he adheres more closely to nature than the generality of even the best dramatic writers. His profligates and villains never reform unnaturally at the conclusion of the story, but die as they have lived, villains and profligates; nor are there to be found in his conceptions of character any of those inconsistencies by which dramatic authors appeal to the passing prejudices of the time, or seek to propitiate a mixed multitude—in the majority of which the moral taste is never of the highest standard. He does not give his prodigals generous and noble qualities, nor is trickery ever countenanced in his stories by the practice of people he means to represent as respectable. In truth, though the stage seems to have suggested to him the species of art of which he may be considered the inventor, yet his views of life were much too sound to allow him to adopt the loose notions of stage morality. Wit is not easily expressed without words, but there is exquisite wit in Hogarth, and his humour is utterly inexhaustible and as rich as the humour of Shakespeare himself. Extreme as are his incidents, there is no exaggeration, and the enduring truth of his representations of life is confirmed by the occurrences of every day. Some of his scenes, from change of manners and fashions, may not be exactly acted now, but his characters are eternal. He has been charged with caricature, and "The City Volunteers attending the Lord Mayor's Procession," the slight etching called "France," and one or two other instances from among his numerous productions, may fairly be given up as caricature; but taken altogether, nothing can be more distinct than the art of Hogarth from that of the caricaturist—a distinction which he has well pointed out in the etching he published to refute the charge. No painter whatever and but few writers have laid bare the evil dispositions of human nature and their inevitable consequences with such a mastery of illustration. He has traced wickedness and profligacy through all the degrees of villany, recklessness, passion, hypocrisy and cunning, cold, calculating selfishness. Yet, never losing sight of nature, he here and there shows us touches of good—and often, as in the world, where we least expect it. The episode in "The Rake's Progress," of the poor girl's story to whom he has broken a promise of marriage is very touching. She offers her hard earnings to release him when he is arrested for debt—she follows him to prison and ministers to him in the last scene of his wretched career, the mad-house. In the "Election Dinner" also, in the midst of corruption and disorder a poor tailor steadily resists the bribe of a handful of gold almost forced upon him, while his masculine termagant wife threatens him with her vengeance.

for having a conscience ; and in another of the election pictures, the "Polling," the dignity of human nature is supported by the maimed veteran who, having lost both hands and a leg in the service of his country, has contrived to place his hat reverently under the stump of one arm, while he lays the hook which serves him for a hand on the Bible. The oath of this man is sure to be conscientiously kept. It is clear from these and many other incidents of a like kind spread through Hogarth's pictures that had he been a writer he never would have conceived Swift's "Yahoos." His heart would not have allowed him, much less his judgment—for he knew that in the degree in which satire is exaggerated it always loses its power. Hogarth was a painter of nature in the highest sense, as distinguished from a painter of matter-of-fact ; and that he did not aim at mere literal truth is shown by many little circumstances in his pictures—among which may be mentioned the lightning pointed with an arrow-head in the fourth print of "The Rake's Progress." The barb is directed against a noted gaming-house in St. James's Street, and the expedient is adopted to attract attention to its direction. Indeed, close literal representations of many of his scenes would be utterly intolerable ; and therefore, as Fielding, an author with whom he had much in common, and Gay, have each redeemed so revolting a subject as the history of a highwayman by a peculiar treatment far from literal, and by making it a vehicle of general satire, so Hogarth has dealt with the scenes of vice he exhibits, in which the mind is perpetually carried away from what is presented to the eye by general allusion, by wit and by humour.

Reynolds's Window, New College, Oxford.

At first Thomas Jervais, who died in 1801, was distinguished for exquisitely finishing small subjects. At Lord Cremorne's villa, Chelsea, was the most complete collection of his early works, consisting of about twenty pieces. The interior of Gothic chapels and castles is exhibited with rays of sunshine, producing the richest effect. In priority of excellence, if not of time, the first is the great western window of the chapel at New College, Oxford. He was paid for the figures of the lower compartment 50*l.* each, 70*l.* extraordinary for the group of Charity and 8*l.* for the lion's head attached to the figure of Fortitude. Total 428*l.* For the whole of the upper compartment 1,100*l.* was paid to Jervais. Sir J. Reynolds received 231*l.* for the use of the cartoons. So that the whole amounted to little less than 2,000*l.* His widow in 1802 publicly exhibited for sale thirty-seven small pieces, which he had reserved as being of more perfect workmanship. She valued them at 2,000*l.* The design was made by Sir Joshua Reynolds, and is divided into two parts. In the lower compartments are placed upon pedestals, in chiaroscuro, seven female figures, larger than life, representing the Christian graces and the cardinal virtues. It is difficult to determine which of these may claim the highest merit. Temperance and Charity are generally preferred ; but Sir Joshua himself gave the palm to the figure of Hope, reaching forward to heaven. The middle compartment of the higher division represents the Nativity, the leading idea of which is evidently taken from the celebrated *Notte* of Correggio, originally at Modena, now at Dresden. The cartoons were dispersed among several proprietors. The Duke of Rutland had the *Nativity*, for which he paid 800*l.* ; the Duke of Portland some of the accompaniments, bequeathed to him by Sir Joshua ; and the Marquis of Thomond the others, with the seven figures. Lord Orford was so enamoured of his Flemish histories and rich mosaics that he was blind to the perfection of the new school of glass-staining. In one of his letters he speaks of Sir J. Reynolds's "washy Virtues" at New College, which is too severe a sarcasm. If the colouring be too faint it was the fault of Jervais ; but was there nothing to be said of the design, expression and grace of the outline?

The Study of Old Masters.

The great importance of the study of the older and greater masters of art, and of the consideration of the means by which they arrived at extraordinary excellence in so many varieties of style, become most apparent when we examine the works of the moderns, who usually exhibit, in comparison with their predecessors, so much of feeble conventionality of treatment, so much unimaginative sameness of design and so little pains taken in perfecting the execution of their pictures. For the object of all criticism ought to be improvement, and it is not by merely discovering and exposing the faults of his contemporaries, but still more by becoming acquainted with the excellences which distinguish the works of perfectly accomplished painters, that the artist and the student of the present and the future time may be stimulated to brilliant and successful exertion. There is no excellence of drawing or of colour which may not be acquired by that ceaseless diligence and toil to which every successful master, from Michel Angelo to Caracci, from Bellini to Titian, and from Perugino to Correggio, devoted himself with unremitting industry. Purity and grace of design and richness of poetic imagination lie dormant in many a mind only because it wants the opportunities of education, and it has

not yet created for itself an intellectual refuge against vulgarising tendencies of public and social life. There is no rendering of beauty or grace, there is no image of simplicity or purity and no representation of grandeur and power, whether in passionate action or in intellectual repose, which does not also elevate and improve as well as delight the mind of the cultivated as well as of the ignorant man ; there is no part of life or of nature, however lowly or minute, nor any phase of these, however transient, that may not become the subject of worthy artistic representation, if only the idea of it be pure, and the little of suggestion contained in it be that of truth at least. Thus in art every species of taste and of skill may find healthy employment, and the student must not despair of honourable success if he fail only in ambitious emulation of the Leonardos and Raphaels.

Thomas Stothard.

The early designs of Stothard made an epoch in art, and led to that extensive and numerous class of embellished publications which have distinguished the many literary productions of the English press, commencing with the "Novelist's Magazine," published by Harrison, of Paternoster Row, and ending with the "Italy" and "Poems" of Samuel Rogers, than whom no one appears more justly to have appreciated the talents of our lamented painter. Stothard had the rare gratification of seeing his works sought after, and the prints from them collected with eagerness by a number of admirers during his life ; nor should it be omitted that in extending his fame through the medium of engraving no one contributed more than James Heath, whose burin was to Stothard what that of Bartolozzi was to the works of Cipriani. His Canterbury Pilgrims, characters from the plays of Shakespeare, and others of his easel pictures, together with his etching of the Wellington Shield, from his own design, were appreciated. Concerning the latter, being one day asked how he could submit to the labour and drudgery of such kind of employment, his answer was, "It is the enterprise of the thing." Stothard considered the profession of an artist, and most especially the distinction of R.A. (as it ought to be), the passport to gentility ; nor was he ever known, by language or eccentricity, to lower the grade of art, however indifferent he might be to personal appearance. In his conversation he was no less original than in his designs, and his observations on men and manners were shrewd and intelligent, though his extreme deafness restricted the exercise of his powers in this way. Stothard regretted that he had not been more employed on works of greater dimensions, such as his staircase at Burleigh, but it is a question if such works would have extended his name, or created so ample a sphere of pleasure as the numerous publications from his pencil. His style was certainly mannered, but in character and expression truth and nature ever prevailed. His humour never degenerated into caricature, nor his grace into affectation. His models were in his mind's eye, but the painter's eye was ever abroad, and memory, faithful to its trust, transferred the resemblance of whatever came under his view for the purposes of art.

The Origin of Art.

The deepest instinct of man's nature is the pursuit of that which is beyond and above him. Even where the earlier traditions of the human race had all but died away, among those from whom revelation was as yet withheld, and in regions where its truths had not yet penetrated, the pure instinct of man has ever soared heavenward. The investigation and contemplation of abstract truths seemed to be the favourite exercise of that intellect which distinguishes man from the lower animals, and he soon instinctively perceived the superior nobleness of this kind of occupation and this direction of his mind, because he felt that its exercise was his peculiar prerogative among created beings. When the natural tendency to thought above and beyond this life, and the natural awe for the power of a Creator, had ripened into some form of religious belief (even among those not yet blessed by any direct message from heaven), the mind became full of grand and sweet and pure emotions, which never found adequate expression in mere language. Those emotions, nevertheless, became more real, more distinct, more ardent, and philosophy began to see in them the revelations of a higher than human nature, the recollections of a pure and spiritual world. The pursuit of such paths of reflection, it was observed, did really ennoble the heart and refine the understanding, and the diffusion of those feelings and those ideas was found to render men practically better in heart and in conduct ; for those whom they did not actually turn to the pursuit of philosophy and the higher practices of religion were at least insensibly chastened and moderated in their desires, and softened from the barbarous indulgence of their passions. But though in this world man shall never pierce the veil drawn over him after the expulsion—shall never know the depths of truth in human existence—still there are ever sent some few among the race of this earth who feel more deeply and see more clearly than their fellows some portion of its beauty ; and though common language may not divulge the experiences of those favoured few,

yet the gifted among them still struggle to publish those happy tidings of a higher state which they have been permitted to catch a glimpse of. Such are the poets and the artists—whom civilised humanity has ever honoured, and whom earlier ages even regarded as inspired, or as if they really came direct from that region above humanity with whose ideas they were filled. Poetry, however, could only express in the language of words what of spiritual truth it had to tell, through the imperfect medium of suggestive images and imaginative metaphors. But the harmonies of nature speak for themselves, in mute language, in every form of nature's works, and through these affect the feelings of the rudest and most unconscious of mankind. And the plastic and pictorial arts grew up as men found that the higher influences of poetry, the truths of the ideal world, were most powerfully and universally expressed in the countenance of man and in the face of natural things. The power of man's intellect and the judgment of his intenser feelings at last found their highest earthly sphere. They were exercised in cleansing the forms of perfect nature from the irregularities and deformities which veiled them in common life—in restoring to them their pristine purity and beauty. And the faculty that produced such works was well called creative, for its results were to most men as of creation, so little do most men dream of the existence of that which is yet ever around, above and beneath them. Such was the birth and growth of art, and in such wise did its influence steal over the race of man. If it could purify the sensual by its suggestion of the pure; if it could tranquillise and soften the turbulent and rough by its example of harmony and peace; if it could content the proud and striving by its touching memorials of simplicity and sufficiency; if, above all, it could strike the faithless with awe for the power of an omnipotent Creator, and charm the apathetic into love of the holy and the spiritual—can it be doubted what must have been and ever be the sweet and lofty influence of art upon the life of the civilised world? That which calls man a moment from the bustling anxieties and petty cares of earth, and breathes over his spirit the fragrance of those sublimer spiritual emotions—that must be surely the true civiliser, fit above all other influences to walk hand in hand with religion herself. Such is art in its highest manifestations; and all art is beautiful and valuable just according to the purity and power of the spiritual emotions it expresses; and the adequacy with which they are rendered.

Plaster Casts.

Plaster of Paris may be hardened so as to bear a more perfect polish than ordinary stucco-work, and not be very readily scratched. This is effected by the addition of certain saline substances, such as alum, borax, silicate of potash, or soluble glass. If an object in plaster, such as a bust, be soaked for a month in a solution of alum in twelve to thirteen parts of water, and then wiped and allowed to dry fully in the air, it will become so hard that it can no longer be scratched with the nail, and will lose much of the brittleness of ordinary plaster casts. Casts treated in this way become stained, and are always liable to attract moisture from the atmosphere. If baked gypsum be moistened with a solution of alum, or raw-powdered gypsum be well mixed up with a similar solution and exposed to a red heat, a mass will be obtained of a dull milk-white, or more usually a slight cream colour, which may be readily pulverised, and will set quite as well as ordinary gypsum, especially if a weak solution of alum be employed in making the paste. Casts prepared of the compound thus formed, although taking a longer time to dry, are unusually hard. They may be exposed to the weather for some time and may be washed with a sponge without injury, and even immersed in boiling water without diminishing their hardness. Those prepared by steeping in a solution of alum, on the contrary, will become quite soft; so much so indeed as to receive the impression of the fingers if soaked for a few hours in cold water. Keene's cement is a plaster prepared in this way. If carbonate of potash or pearl-ash be mixed with the alum, so as to form a basic alum, we have Martin's cement; and if for the alum we substitute borax, we have Parian cement. Common plaster of Paris casts resemble, in many respects, the dense gypsum from which a good deal of the plaster of commerce is made; and as this differs from alabaster only in its molecular structure, many persons have imagined that it might be possible to convert plaster into a material resembling that beautiful substance. The nearest approach which has yet been made to the solution of this important problem is Cheverton's invention of the so-called protean stone or plastic ivory. This substance, which is well adapted for carvings in imitation of ivory and the manufacture of various ornaments, is made by exposing the plaster cast or block of the same substance to a temperature varying from 250 deg. to 350 deg. Fahr. during twenty-four hours, by which the whole of the water combined with the sulphate of lime is driven off, and the material reduced to the condition of plaster of Paris. After undergoing this operation it still retains its form, but is exceedingly friable. Sometimes dry pulverulent

plaster is pressed into the moulds, instead of casting it in the moist state; but in this case also it is subjected to the drying process, although the plaster had been previously baked. If it is intended that the object should have a certain translucency like alabaster, it is then soaked in some transparent hard varnish, purified olive oil, or melted stearine. If, on the other hand, it is intended that it should be quite opaque, this operation is omitted. The objects are hardened by immersing them for a moment in water at a temperature of from 64 deg. to 67 deg. Fahr. This operation is repeated every ten or fifteen minutes, until the sulphate of lime is completely saturated, by which means the mass becomes crystalline and harder than alabaster. The important part of the process is the stage-wise combination of the water with the sulphate of lime, and unless great care is bestowed upon it the mass crumbles to powder. By mixing various pigments with the water, any desired colour may be given to the plaster. If sand be fused with about three or four times its weight of pearl-ash, a silicate of potash or glass is formed, which is quite soluble, and has been occasionally employed to impregnate wood, which it renders incombustible. If plaster casts be worked with this substance, the sulphate of lime and silicate of potash mutually decompose each other and form a new compound, which is exceedingly hard, bears a good polish, and may be washed with soap and water.

Berghem.

The works of but few painters exhibit more unequivocally the degrees of comparison of good, better and best, than those of Berghem. In his known early productions, the style, colouring and execution of his last master, Jan Baptist Weeninix, are so evident that such pictures are, with great propriety, designated as being in his Weeninix manner, and are readily distinguishable by a predominance of red and yellow ochre tints, and an uncontrolled or immatured style of handling, by which the just forms of nature are frequently violated. He gradually corrected these defects by making nature alone his model, and ultimately attained a style and manner combining the several qualities which give such high interest and value to his works, and place him, both as a landscape and animal painter, among the best artists of the Dutch school. That he possessed in a considerable degree a classical taste is evident in most of his landscapes, and particularly in those representing mountainous scenes, diversified with broad masses of trees and cascades of water, or when the view exhibits a wild and arid site, leading the eye over the dreary fell to distant mountains, behind whose lofty summits the sun has set and left an intervening gloom. His more familiar scenes are frequently adorned with the ruins of aqueducts, fountains, bridges and temples, rendered gay by the presence of the genial warmth of a fine summer morning, or the glowing heat of the setting sun. Such, indeed, is the variety of scenery observable in his works that he must have possessed an inexhaustible store of materials ready for his fertile and imaginative genius to combine and dispose as his judgment dictated. The beauty and excellence of his landscape delineations would have been alone sufficient to establish for him a lasting reputation; but when, in addition to his merits in this department, is added the cattle and figures which animate in so delightful a manner the various scenes already briefly noticed, it will not surely be considered incorrect in placing him at the head of the several painters who have employed themselves in the same department of art. The numerous drawings in chalk or Indian ink of animals and figures, which enrich the collections of the curious, prove how indefatigable he was in studying nature, in order to arrive at that degree of perfection which is evident in all his best works. His figures are not only admirably drawn, but there is also about them an air of graceful movement that is peculiarly attractive, and their picturesque appearance is also much enhanced by their costume, which gives them more the resemblance of the peasantry of Italy than of Holland. He was equally an adept in representing the various species of animals which compose the domestic race, showing in every instance a profound knowledge of the anatomy and of all the details which characterise the several kinds. But whether the picture represents landscapes, animals or figures, or all combined, there will ever be found a skilful arrangement of the objects, executed with a dexterity of hand that proves him to have possessed such a thorough knowledge of his art that all doubt and hesitation as to the result were, with him, out of the question. Berghem, like several other excellent painters, was seduced by vanity to attempt historical and poetical subjects, and also portraiture; but these efforts have, in most instances, been attended with failure, and such productions are in general of little comparative value.

A Sanitary Congress will be held in the Champ de Mars, Paris, from July 8 to 13. The presidents of the sections will be MM. Tollet, Bechmann, Morin-Goustiau, Hermant and De Baudot.

NOTES AND COMMENTS.

THERE is so much archæological interest associated with Chester, a society which has for its object the study of the remains deserves encouragement. Although honorary officers are forthcoming there are expenses in all societies which must be met in cash. The Chester and North Wales Archæological Society, that can show a good record, starts on its new year with only a balance of 40*l.* in hand, with a printer's bill of larger amount awaiting settlement. There is also a diminished number of members to be drawn on; last year there were 258, now there are 249. The annual report is, however, sanguine. Mr. E. HODKINSON, architect, has consented to take the office of hon. curator in addition to that of hon. librarian. In January last the new wing of the Grosvenor Museum was ready for occupation, and the members are congratulated upon having a splendid room in which to display the various objects of antiquarian interest in their possession and under their charge. The improvement committee of the Town Council have also allowed the corporation workmen to remove the Roman stones, &c., to their new positions. The Council appeal to the citizens to preserve the character of the old buildings in the city, whenever it becomes necessary to repair them. The following officers have been elected:—Hon. editorial secretary, Rev. Canon MORRIS, D.D.; hon. curator and librarian, Mr. E. HODKINSON; general secretary, Mr. J. T. POWELL; hon. treasurer, Mr. JOHN DODDS.

THE late Mr. EWAN CHRISTIAN left property of the gross value of 29,585*l.* 14*s.* 11*d.* In his will he bequeathed 1,000*l.* upon trusts for his two younger daughters, for each of whom a gold watch is to be bought to remind her, "and as a memorial, of the passing of time and the coming of eternity." Sums of 500*l.* Consols and 500*l.* Bank of England stock are to be settled in favour of each of the testator's daughters on her marriage, and he bequeaths to his daughter ELEANOR 500*l.* There are other legacies, and Mr. CHRISTIAN leaves his residuary estate in trust for his wife for her life, and, subject to her life interest, for his children. To Mr. CHARLES PURDAY a gold watch was left, and another to Mr. W. H. ESPENETT. Mr. CHRISTIAN also expressed the desire that his past and present pupils should choose each, in the order of their age respectively, a complete work from among his books.

SOME time ago it was announced that a sarcophagus found at Sidon held the body of ALEXANDER THE GREAT. It was deemed so valuable the Turkish Government would not allow casts to be taken from it. Three others, which were also fine examples, were subsequently found at Sidon, and they are all in the Constantinople Museum. A paper on them was read by Professor PERCY GARDNER at the meeting of the Hellenic Society on Monday. It was said that the great sarcophagus was not the tomb of ALEXANDER THE GREAT, who was known to have been buried at Alexandria. It was probably that of one of the kings of Sidon, which at about 380 B.C. had formed a close friendship with Athens. But the style and incidents pointed to the period of ALEXANDER, whose figure appeared on the tomb. The distinction was clearly marked between the Macedonian and the Persian dress, and the fact that a prominent figure is that of a Persian or Phœnician striking down an opponent, with Persian warriors on either side, was strong evidence that the work could not be ascribed to Greeks. In another part there were Greeks fighting Greeks, and the treatment was somewhat confused, but artistically confused, and exhibited a masterly power of expression. One of the figures was conjectured to be that of HÆPHESTION, the friend of ALEXANDER. The style was more like the Amazon sarcophagus at Vienna than any other extant monument of antiquity. The sarcophagus known by the figures of weeping women was considered by the Professor to be also a work of the fourth century before our era. The work was eminently of an artistic as distinguished from a historical character, and was marked by some of the most admirable qualities of the Greek genius. There were pillars along the sides and ends of the sarcophagus and figures of eighteen women—"a dirge," as had been said, "in eighteen stanzas." All the figures were in different attitudes, and each had an

individuality of its own. But in all there breathed the same spirit of gentle diffused melancholy and they exhibited the self-restraint and charm which were discerned in the sepulchral reliefs at Athens. In another the characteristics were less distinctively Greek, and the interest was not merely decorative but historic, and involved various events in the life of a man, including that of a father's sending out his son into the world. Professor GARDNER came to the conclusion that the four sarcophagi were of the later kings of Sidon, and that of the mourning women might be, perhaps, ascribed to King STRATO, the friend of Athens. The sarcophagi suggest that if explorations were properly conducted in the same region they would be well rewarded, but there is not much advantage in such works falling into the possession of a race who cannot enjoy them nor will allow others to do so.

THE decision of the Académie des Beaux-Arts on last Saturday will not we trust lead to the eventual suppression of the Prix de Rome, but when a dangerous innovation is sanctioned who can tell to what it may lead? By the laws of the institution all candidates for the prize must be bachelors, and must remain so while they enjoy the privilege. The Académie de France in Rome is intended to be to all its students what old BOWYER declared Christ's Hospital should be for the home-sick COLERIDGE, father and mother, uncles and aunts, cousins, and a substitute for all relations, however tender. But one of the musical prizemen wished to take a wife and to settle down peaceably as an organist. After a long debate the Académie des Beaux-Arts has approved of the arrangement. Now that a precedent is established we may next hear of a painter, sculptor or architect soliciting permission to bring a spouse with him, and if womankind once enter the Villa Médicis the beginning of the end will be reached.

GOTHIC is not the only style which seems to be in danger of destruction in France. There could be no suspicion of Germanism about a building erected from the designs of an Italian architect in 1610, but a building of that class was doomed to demolition last week. We refer to the chapel of the Lycée in Rouen, which some of our readers may remember. The plans for it were prepared by MICHEL BOSIO, and evidently were inspired in part by some of the details of St. Peter's, Rome. The building stood on the site of the Hôtel de Maulevrier, and it is supposed the materials were derived from the Château-Gaillard. The members of the Municipal Council do not care much for chapels in any style, and accordingly they have decided that BOSIO's work must be supplanted by a new kitchen. Their order has to be approved by the Minister of Fine Arts, but of late years Ministers are ready to sacrifice anything so long as municipal authorities and voters are gratified.

IT seems remarkable that an artist who won the Prix de Rome as far back as 1839, who was for a long period director of the Academy in Rome, who has been a member of the Institut since 1874 and gained the highest honours at international exhibitions, should have waited until 1895 before he received the Médaille d'Honneur of the Salon. That has been the fate of M. HÉBERT, whose *Peasants of Cervaro* we illustrated some years ago. Throughout his life he has devoted his days and nights to art alone. He kept aloof from cliques, and in consequence men who were more remarkable for wire-pulling and other electioneering arts were preferred to him. In this year's Salon M. HÉBERT is represented by a characteristic work, *Le Sommeil de l'Enfant Jésus*; but it was the remembrance of his long and honourable career which influenced the voters. For M. HÉBERT 239 votes were recorded, while M. HENRI MARTIN, a young painter who is engaged in the decoration of the Hôtel de Ville, who was his principal opponent, attracted only forty-five. M. BARTHOLDI, who designed the immense figure of *Liberty Enlightening the World*, which does duty at the entrance to the harbour of New York, as well as some memorials of the war of 1870; deservedly obtained the Médaille d'Honneur for Sculpture. M. CHARLES BAUDE, a wood-engraver, gained the medal for engraving.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting of the present session of the Association was held on Friday evening, Mr. E. W. Mountford, president, in the chair.

The annual dinner, it was announced, had been postponed till Friday, the 14th prox., to take place at the Holborn Restaurant, at 7 P.M.

Mr. A. C. Long and Mr. J. E. Colon were elected members. In connection with the soirée, a vote of thanks was passed to Mr. Earle and Mr. Sim and also to Lieutenant-Colonel Balfour and Captain Whyte.

House List for 1895-96.

The following were elected to serve for the ensuing session :—

President.—W. D. Caröe.

Vice-Presidents.—G. H. Fellowes-Prynne and F. T. W. Goldsmith.

Committee.—E. W. Mountford, A. B. Pite, F. G. F. Hooper, J. Begg, O. Fleming, W. H. Seth Smith, E. Woodthorpe, Theo. Moore, the Hon. A. McGarel Hogg and A. W. Earle.

Treasurer.—Hampton W. Pratt.

Librarian.—J. W. Stonhold.

Assistant Librarians.—C. H. Freeman and E. W. M. Wonnacott.

Secretaries.—B. F. Fletcher and A. H. Hart.

Auditors.—L. H. Sim and F. G. W. Bass.

Assistant Secretary and Registrar.—D. G. Driver.

Mr. WALTER CRANE read the following paper, entitled

Influence of Architectural Style on Design.

Mr. Crane said :—It seems tolerably obvious that without shelter of some kind, without walls or roof, without suitable materials, determined limits, proportions and prepared surfaces the art of the decorative designer, whether in sculpture or painting or any other method of expression, could not have much chance of serious development, historic continuity or permanent existence. The natural walls of cliffs and caves might be utilised certainly, as they have been in prehistoric times; bold tribal ensigns, such as the "White Horse," cut through the green turf on the chalk in a kind of natural sgraffito, as it appears upon the Wiltshire down, might exist (with periodic scouring) for ages; but it is only with the development of the constructive art that organic ornament springs to life; only with the squaring and joining of timbers, moulding of bricks and tiles, and the cutting and dressing of stone, and their use under the constructive necessities of a building, that the sense of relation or proportion is born, without which we could have no fine art at all.

It may be an open question whether the impressionist individual graphic sketcher or the constructive associated craftsman designer represented the primitive artistic condition. We are apt to colour history as well as art by the tint of our own sympathies; but, judging from the fragmentary sgraffito of the cave-men, it would almost seem as if the former were the first in the field, and that man only slowly found his way to the harmonious related and ornamental forms of art after he had made some progress in the construction of the primitive dwelling. It seems probable that from the material and method of construction of the wicker and wattled walls of the primitive hut were derived motives for some of the first types of pattern design. The primitive hunter-artist might scratch the forms of the reindeer and mammoth upon the bone handles of his weapons, or the herdsman-astronomer cut the signs of the sun and moon, of fire and water, upon clay or stone; but the sense of rhythm and harmonious recurring line would have to be learned in following the useful craft of the rush-plaiter and basket-maker, to whose simple constructive methods we owe at least two important plans of ornament—the checker and the spiral meandering line. Their value, too, has never been forgotten in ornamental work, and when man learned to work stone and bronze he still perpetuated these primitive motives.

In considering the bearing of the architectural influence upon decorative design of all kinds, which is so marked in all historic art, we may conveniently adopt Mr. Ruskin's three broad and main divisions, which indicate the fundamental differences of constructive principle in architecture, namely :—

1. The architecture of the lintel.
2. The architecture of the round arch.
3. The architecture of the pointed arch.

Or characterising them from the decorator's point of view by their leading ornamental spaces or features, we might distinguish them severally as :—

1. The architecture of the frieze and pediment.
2. The architecture of the spandrel and dome.
3. The architecture of the vault and window.

Of lintel architecture ancient Egypt gives us the most massive examples, but it seems most probable even here that stone construction only followed wood, or rather reeds and clay, and that the types and systems of ornamentation were originally suggested by those materials. If we look at the primitive Egyptian house, planned for a hot climate, built by the great riverside of materials furnished by the river itself, we may see the type of the massive Egyptian temple column (in the clustered reeds fixed at the angles); this but represents in stone, and more formally, a bundle of lotus reeds bound together by fillets of rushes, with the bud and flower clustered at the top to form the capital. The covered cornice of the flat mud roof made of rushes is perpetuated in the painted cornice of the pylons of the great temples, as at Edfu and Philæ. The mud wall built in layers filled in between the framework of reeds, with its horizontal and vertical divisions marked by them, may also have suggested the subdivisions of the stone wall to receive the hieroglyphics and figure-paintings; but with the adoption of stone structure came stone sculpture, and the temple walls are regarded as great surfaces for the permanent record of the mysteries of religion, of the powers and attributes of gods and kings, of their wars and conquests, and of the labours of the people upon which the wealth and power of empire always rest. The Egyptian wall reliefs were sunk, the outlines being hollowed and the edges of the figures rounded, so that they never projected in relief beyond the surface of the wall. We may consider this an elementary stage in the evolution of relief sculpture, but undoubtedly the broad and massive monumental look of the walls, which is so marked a feature of the Egyptian style, owes its character to this treatment. The statues have the same simple, broad, massive architectural character as if they were the half-emerged spirits of the changeless stone itself, placid of countenance and tranquilly indifferent to the passage of time; they impress us with their sublime dignity, which belongs alike to their sphinxes and lions which guard the portals as to the small portrait statue. Even where these latter show an extraordinary realism, as in the famous scribe of the Louvre, with the eyes of rock crystal, quartz and bronze—a work of the early empire—they are still under the influence of this architectural control, simplicity and reserve, which seem to me to give dignity to all Egyptian art. The Egyptians, though acquainted with the use of the round arch, did not use it as an architectural feature, like the Assyrians in their palace gateways, and who also, according to Viollet-le-Duc, used the round brick vault to support the roof of the interior large halls of these palaces; but the sculptor was the chief decorator in the Assyrian palace. He kept the door with his mighty winged bulls, man-headed, meeting at the angles, and facing outwards in a formidable way, their general design controlled by the rectangle of their position and architectural purpose, and he covered the alabaster wall slabs with delicately-chiselled reliefs, in which the story of his times and the customs of his country is graphically, if somewhat rigidly told.

The ancient Persian depended largely for his architectural effects upon lintel and column, the peculiar form of the typical capital suggesting its origin in the timber-built houses of the Medes, with forked tree stems supporting the beams of the roof. The wall decoration of glazed bricks from the ancient fortress and palace of Susa shows the Persians to have been accomplished workers in that material, and to have been early distinguished for their ornamental and colour sense. The frieze of archers moving in severe profile along the battlements of the fortress forms a striking decoration, and at the same time a remarkable illustration of the architectural influence, since the decoration not only shows this in its design, but could not have existed apart from the actual wall and its construction. The very joints of the bricks help the general effect and vary the surface. Design, colour and modelling are here one with structure. The figures appear to have been pressed upon the clay while soft from wooden moulds, and then divided into bricks, the bricks being long in proportion to thickness. The colour surface of the turquoise blue of the ground is very varied, being put on in small round flattened disc-like patches. The figures are alternate as to richness, patterns and colour, though alike in attitude. The small repeated device upon the coats of the alternate arches is supposed to represent the fortress of Susa itself in an heraldic sort of way. In the palm-leaf like running border, as in a similar design of frequent occurrence in Assyrian ornament, we see the type afterwards developed by the Greeks in the anthemion, who must have been largely at first under Asiatic influence. To the Greeks, too, we owe the simplest and most refined type of lintel architecture in the Doric temple, which was apparently evolved from a timber-built shrine or tabernacle, the triglyphs which divide the

external frieze into panels representing the ends of the cross beams. These, with the vertical grooves, serve as a framing for the sculpture, which, as in the Parthenon, filled the metopes or spaces between them. The low-pitched roof terminated in a pediment, and these pediments again afforded a space for sculpture. In the arrangement of the groups which filled the eastern and western pediments of the Parthenon, shattered as they are, with the assistance of Carrey's drawings, we may detect the controlling influence of architectural line. In fact, figure-sculpture intended to be placed in a pediment can only fill its position when it acknowledges this control, since the groups, however varied, must be enclosed by the rigid boundary of the space, running into extremely acute angles at each end.

The subjects were the contests of Athene and Poseidon for the patronage or protection of Athens, and both pediments were symbolical of all that the Athenian citizen held dear. In the eastern pediment we have the fragments of a great sculptural and decorative epic, the central point of the birth of Athena being lost, but in the figures and groups that remain I think it is clear how constantly in the controlling lines, both of groups like the Fates and in single figures like the Theseus, the long sloping angles of the pediment recur through infinite variation, and give harmony and relation to the whole work, from the extended arms of the sun-god rising in the extreme angle, driving his horses, whose heads emerge from the sea, to the descent of Selene, with the horses of night, in the corresponding angle.

We find here that great principle which holds good throughout all design—the principle of recurring or re-echoing line, which governs both the disposition of masses and the arrangement of detail. We may trace the indications of the same feeling in the design of the metopes and of the famous frieze of the cella, which is still more decidedly ornamental in its lines, and might almost have been planned upon those of a running rhythmical scroll border. There is, of course, in practice all the difference in the world between working consciously and dryly, according to fixed principles, and working inventively and freely under the influence of architectural geometric lines and spaces. To acknowledge the existence of natural laws in art is a very different thing to being a slave to an academic tradition, as in art there are generally a variety of ways of solving a particular problem.

It may be said, indeed, that however beautiful these sculptures are as individual figure-sculptures, and regarded solely as such, they are strictly architectural ornament and parts of a whole, and their distinction of style is, I venture to think, largely owing to that fact. The truth is that the human figure was really the ornament of the Greeks. Their types of strictly ornamental pattern in the ordinary sense were extremely limited and mostly derived from Asiatic prototypes, however refined upon and perfected by delicacy and precision of workmanship. But in all their productions in figure design they were free and inventive, and whether the aim of their artists was to produce a terra-cotta statuette, to paint a vase, to carve a marble statue or a frieze-slab, we find the same extraordinary feeling for grace and appropriateness and sense of controlling line. Another point we may note about these Parthenon sculptures, true of the use of sculpture in the Classical temple generally, is that they are not used to emphasise what I should call the constructive features, but to fill the interstices of the construction. The building stands without them; or I suppose few would be prepared to justify their presence in the British Museum if they were there at the cost of the fall of the Parthenon, though there are many who do so now, although they are there at the cost practically of its artistic destruction. That is to say, the building without its sculpture is somewhat like a man with his eyes put out.

Close by, however, we find an illustration of the opposite principle, the sculptural emphasis thrown upon the constructive necessities, in caryatid columns of the Erechtheum. In these we have a notable instance of the union of sculpture and construction, and it is evident that in the treatment of these figures the sculptor has strongly felt the necessity of architectural massiveness, simplicity, dignity and reserve. They each support the cornice upon an abacus and cap, and the columnar vertical feeling is expressed by their erect attitude, slightly varied individually by the severe vertical lines of their draperies. The caryatid idea is, no doubt, a most difficult one to treat satisfactorily, and there is a sort of painful slavish suggestion about it, as of human beings condemned to support an intolerable burden. It was said of the imitation of the Erechtheum caryatides at St. Pancras Church that they might be intended for St. Pancras householders groaning under the burden of heavy rates. There is no suggestion of restlessness or pain about the originals, however. The idea constantly recurs in Renaissance work, though without the Greek simplicity and reserve which alone makes it tolerable. The prototype of the sculptural pediment may, perhaps, be found in the sculptured slab placed to fill the hollow left by the relieving arch over the massive lintel gateways of the ancient cyclopean buildings in Greece, as at the gate of Mycenæ. In the sculptured lions and

column we have, too, a simple exemplification of the symmetric principle in design; as well as of that recurrence or re-echoing in the design of sculpture of the lines of the enclosing space.

The architectural influence is marked enough in the design of the accessories of Greek life, chairs and couches, lamps and pitchers. Forms and proportions varied not like later work, which in the Queen Anne period often followed in metal the proportion and details of the classical column.

The columnar idea is carried out in the bronze tripod standards used for lamps; it reappears in the supports of seats and chairs, and the figure frieze is used as a system of decoration for vases. With the use of the round arch other elements and principles were developed in decorative design. Under the Romans the capital, columns and cornice became more ornate in design, and this necessitated a more strictly ornamental treatment of the frieze, which became continuous and unbroken into panels by triglyphs. And the garland, or swag, as we term it, originally a temporary festive adornment, became a permanent decoration, valuable for its recurring graceful line, especially as adapted to the friezes of round temples and tombs—like the Sibyl's temple, and the tomb of Cecilia Metella; the vertical lines we see being obtained by the pendant ends and ox skulls, though the tradition of the ancient timber construction was still retained in the egg and tongue and dentil mouldings, which had long become purely decorative enrichments. The pilaster and cornice were also added to the architectural decorative resources, which were further enriched by the addition of such suggestive spaces for the painter and sculptor as the lunette, the spandrel and the medallion, while the decorative value of inscriptions was fully realised with the use of the dignified and severe forms of the Roman capital letters, re-echoing the vertical lines and angles of the architecture.

The fusion of Classical and Oriental feeling with Christian mysticism in Byzantine architecture, with which came in the use of the round vault and dome, opened a new field for that most splendid material, mosaic, which became *par excellence* the principal means as well as all the glory of the interior decoration of Byzantine buildings. In the churches of Ravenna and St. Mark's it dominates or takes the place of all other decoration, its impressiveness being largely due to this, and one feels it to be sufficient in itself. The concave surfaces of the vaulting afford a peculiarly appropriate field for the most effective use of the cubes of coloured and gilded glass, by means of which the designs are built up. The very method of mosaic work harmonises it at once with the craft of building, of which it becomes a part. It is a constructive method of surface decoration entirely in harmony with architectural construction, capable of the utmost splendour, and yet full of solemnity. The nature and conditions of the material seem to place natural limits upon its graphic or pictorial range, which, curiously enough, it appears to be in the nature of the degree of evolution of any art (or perhaps of artists) continually to attempt to overstep.

One has only to compare the decorative effect and architectural feeling of the Byzantine mosaics with the late Roman attempts to reproduce Renaissance pictures at St. Peter's to be convinced of its true artistic province and treatment, and to be left in no doubt as to which influence, that of architecture or of painting, has proved the most beneficial and inspiring to the mosaic designer and worker. We have in our own time in recent years returned to the old method of working glass mosaic as an architectural decoration, to working in on the surface, and *in situ*, as the only means of obtaining that richness and variety of surface and play of light impossible to be attained by the mechanical method of making flat slabs of tesserae on the back of the cartoon in the workshop.

The most important piece of modern mosaic work of our time and country is that upon which Mr. W. B. Richmond is now engaged at St. Paul's Cathedral. Personally I am not in favour of modern artists decorating a building of a former age—at least in the present condition of art and craftsmanship. I should put new wine into new bottles, and artistic interest in those places most bare of it. But I think, nevertheless, Mr. Richmond and his able assistants, the mosaic workers of Messrs. Powell, are carrying out a very fine, thoughtful and splendid piece of work, full of ability in design and conception and technical skill, governed by the architectural feeling of a decorator, even though that feeling may compel him to mask some of the characteristics of the building he is decorating—but then comes in the modern difficulty. From the mosaic point of view one might wish St. Paul's had been a Byzantine building. Notable characteristics in the design of Byzantine mosaic are the simplicity in the design and arrangement of masses. They are in some instances almost heraldic in their ornamental effect, and there is no doubt that the silhouette of figures or groups as thrown upon a gold ground is the most important consideration in the case of design intended to be seen from a long distance and in subdued or half light, and upon the concave surfaces of a dome.

As subsidiary to its chief decorative splendour in mosaic,

Byzantine sculpture shows a certain restraint, reserve and a linear feeling in its design, though with considerable richness of detail, as in the carving of the characteristic cushion and basket-like capitals and screen panels of open work, which also suggest wicker and ropework motives. This linear feeling and lattice, wicker and ropework motive can also be traced in the typical carved ornament of Romanesque work generally, as for instance in the mouldings of Norman arches and the caps of the shafts. These characteristics may perpetuate the tradition of the construction of the primitive buildings in this country of wood and wicker. In Norman ornament the use of recurring line and repetition of unit is very marked, and its peculiar character and richness is due to this. The zigzag moulding itself is an illustration of the principle, and simply repeats itself in varying proportions and projections. Some of the outer rings of Norman arches and arcading simply repeat the leading constructive form—the semicircle of the arch itself. This is still more observable when we come to the architecture of the Pointed arch and the gable, where the mouldings surrounding the window and door-heads repeat in projection the lines of the window and door in serving their original office of keeping the rain from the window and wall, richness of effect being gained by the variety of the alternating concavities and convexities of the section. Gothic work generally illustrates the opposite principle in the use of enrichment to that which we noticed in the Greek, inasmuch as the ornamental emphasis is generally thrown upon the constructive points themselves rather than on the interstices. We get the clustered and filleted shaft, the ornate foliated capital in endless variety; the richly-moulded arch, the cusped arch, the window tracery; the moulded ribs of the vaulting, their junctions marked by richly-carved bosses, and, if a corbel or bracket is used, the opportunity is seized by the sculptor for a head or a winged angel, but worked strictly in accordance with the size of joints of the stonework, and therefore always showing the controlling architectural influence. The exterior of a Gothic building is almost equally expressive of its construction; the buttress is made an important decorative feature and a source of variety and light and shade, often crowned with a pinnacle, and, in its flying form, supporting an apse, as at Wells, extremely elegant in design, moulded and pierced. The door and window heads are moulded; the spring of the roof is often marked by machicolations, and the parapet battlemented or pierced. The gables are crested, towers are pinnacled and spired, and tipped with vanes. This emphasis on the constructive features gives an expression of organic life, directness and strength which is characteristic of all Gothic design. Interstices are, of course, extensively used, as well as the tympanums of porch arches, and niches through these massed together and super-imposed and filled with figure sculpture, as in the west fronts of many cathedrals; they appear to be inseparable parts of the structure, and they aid in the lines and general feeling of their design and treatment the general structural effect, just as we have seen the sculpture of the Greek temple did, though in a different way.

Just when design was emerging from Byzantine tradition, or perhaps adding to it by fresh and simple inspiration from nature, and acquiring technical freedom, in the thirteenth century, Gothic sculpture appeared to reach a grace and vitality which relates it to the best Greek work. English Gothic sculpture has suffered so much from the destroyer and defacer that it is difficult to find a complete example to compare with continental work, the west front of Wells Cathedral being supposed the only important façade of Gothic architectural sculpture remaining in England, although there are many interesting and beautiful monuments and effigies, both early and late, scattered throughout the land, remarkable no less for their character and worth than for their ornamental beauty and architectural feeling. But perhaps we have nothing of quite so fine a quality as the French cathedrals show, such as the central pillar of the porch of Amiens, the figures from the west porch of Auxerre, nothing of that wonderful, delicate, pathetic beauty of the early Renaissance sculpture of Italy—such as the figure of Ilaria of Lucca displays. Although among the recumbent monumental effigies scattered about in the churches and cathedrals of our own land, there is plenty of fine work closely corresponding in feeling with the characteristics of the contemporary architectural design of the same dates, we get in the thirteenth century the recessed and richly-canopied tomb, as that of Gervase Allard at Winchelsea, where the design is part of the wall itself, and where architectural detail forms a large part of the interest, but yet appropriately leads up to and frames the dignified figure of the knight reposing beneath. The idea of the recessed tomb might possibly have been derived from the Mediæval bed recessed in the wall—the “shut bed” of Mr. Morris’s romances, the use of which still appears to linger in Brittany.

The shadow gained by the recess certainly gives solemnity and impressiveness to the sculptured effigy. The effigy is frequently sculptured upon an arcaded tomb, shields with the bearings of the family filling the panels between the arches, which are made to subserve by their more formal masses and

vertical lines the freer and more horizontal ones of the sculptured figure. Architectural design and sculpture are in these works inseparable. The later Gothic tombs take the form of shrines built clear from the wall and overhung with rich tabernacle work, buttressed, and sometimes enclosed with wrought-iron railings, in the design of which may again be seen the prevailing architectural influence of the time. (An example of the like from Wells Cathedral shows the buttress and battlement used ornamentally in the principal supports, the intermediate irons being hammered into finials of a fleur-de-llys form.) We find the same principle of the re-echoing of architectural detail and its adaptation to ironwork in later time, as in this bit of the altar rail at St. Thomas’s Church at Salisbury, where we get the form of the Elizabethan gable and volute cresting the principal standards, which below are treated as pilasters of open work. Even in the extremely free and fantastic ironwork, like that of the porch-gates of St. Laurence at Nuremberg, we may still see an acknowledgment of certain architectural and structural lines and limits. Or where, as in the free and flowing scroll of a hand-rail from a church at Rothenburg (for a sketch of which I am indebted to Mr. Spiers), it seems to escape from all structural trammels, we yet feel that the curves are designed with a view to fill the panel with an evenly dispersed grill of curves, and in strict, though not formal, relation to the square of the enclosing rails.

Not less instructive for the evidence they give of architectural influence are Mediæval brasses in the treatment of the figure, the enclosing borders and the use of inscriptions. More especially remarkable in design and draughtsmanship are the Flemish brasses of the Gothic period, where the full-length portraits of the personage or personages commemorated occupy the principal space in the panel, not cut out in silhouette and inlaid on the stone slab, as generally is English brasses, but relieved upon a rich diapered background. The ecclesiastical ones are often richly canopied, the borders full of smaller subjects, and resemble in arrangement and treatment the typical stained-glass canopied window of the fourteenth and fifteenth centuries. The broad vertical and simple treatment of the draperies is very marked, and the character drawing is often very fine. With the attempts to gain more surface qualities, with the use of greater complexity of shading lines, when, in short, what is commonly called the pictorial element comes in with a desire to escape from the architectural influence, design, ornamental effect and draughtsmanship all decline.

It is the same in other branches of design, such as stained-glass, which at its best shows such close relationship to the architecture of the building it enriches. With the evolution of the window from the small round-headed loopholes of the Byzantine, through the simple lancet-pointed lights separated by solid masonry to the foliated tracery and subdivided mullions of the later Gothic, the splendour of mosaic gave way to the splendour of the stained-glass window—at first a jewelled web of geometric lead thrown across the light; the form of the simple or cusped points of the tracery influencing the lead lines they enclosed, and the long vertical lines in the figures of saint and angel re-echoing the long lines of the narrow pointed light, into which ascended later the pinnacles of the canopies. Up to the end of the fifteenth century each light was still generally regarded as a separate panel, but with the large windows subdivided with light tracery and thin mullions it became feasible to consider the design as filling the whole window.

The next step was to consider it as a transparent picture, to represent architectural perspective, which in this direction was a form of architectural influence distinctly injurious to the beauty of glass. We may imagine that the stained-glass window represents a thin, flat, transparent screen (however varied by quality of colour), continuing the wall in another material and thus preserving the idea of shelter and seclusion we always want in a building. Anything which interferes with this feeling, or contradicts it in design, which shows an effort to escape from the necessary conditions of the material leads one astray. A kindred feeling determines the treatment of the wall, and perhaps nowhere is the necessary architectural influence more felt than in mural decoration. Anything which disturbs the general flatness and repose is out of keeping. We may gain a certain accidental or naturalistic interest, but at the cost of decorative repose and richness. The Italian fresco painters of the Early Renaissance from Giotto and his school, thoroughly understood this, and though in details naturalism was carried quite far, as in the beautiful frescoes in the Riccardi Chapel at Florence by Benozzo Gozzoli, in spite of all their richness and variety they remain essentially wall-paintings, as completely mural as the finest arras tapestry, such as those splendid Burgundian specimens at South Kensington, which, while absorbing much of the new splendour and detail of the early Renaissance, remain Gothic in spirit.

The great principle in the design of these tapestries as of early wall-painting was the exclusion of sky-spaces and atmospheric planes which necessarily, in proportion to the illusive design with which they are represented, must throw the wall out of the perpendicular. There is an instance of a sky- and

distance having been introduced later at South Kensington. We do not want to think we are out of doors while in a room, so that all successful mural decoration never forgets the wall—it acknowledges, in short, the architectural influence. The same principle is to be traced in other textile design, in the geometrically planned and heraldically treated silk hangings of Sicily, and the Venetian and Genoese velvets and brocades, with motives derived from Eastern sources, which would fall naturally into the lines of the offices they decorated, and which frequently repeat the geometric foliated forms of Arabic and Gothic architecture, as in the brocade from an Annunciation in Memliné. We see the value they are to the painters and designers in affording rich backgrounds of definite recurring masses of pattern, to oppose the varied outline and relief of their figures.

There remain still vast provinces in design we have not been able to traverse in our search for the architectural influence which, in times of living artistic traditions, closely associated arts and crafts, and an organic architectural style springing, as it were, from the very soil of the country was paramount throughout art. Furniture and woodwork, one might say, has an architecture of its own, pressing into its service painting, carving and metalwork, and has often been part of the building itself. In detail and enrichment furniture constantly re-echoes the detail and enrichment of the prevailing architectural style of its period, from the graceful lines of the classical couch, chair and lamp standard, which have reappeared in our own century, to the massive and simple oaken bench and trestle table of Mediæval times, or the richly carved and canopied seat. The arabesque panelled pilaster and classical cornice enrich Italian cabinets and coffer; the turned chair or table leg of the seventeenth century onwards constantly repeats in varying proportions the features of the quasi-classical column; the broken pediment surmounts the Chippendale bookcase, while Greek refinement of line and feeling for delicate carved surfaces reappears in English chairbacks of the same period, and excesses of the later French Renaissance break out in the curly legs and dissipated scrollwork of current trade furniture.

Historic costume, too, has the strictest relation to architectural style, from the simple and constantly varied folds of classical tunic and toga, the hood and peaked head-gear, and heavy vertical folds and figured stuffs of Mediæval times, from the periwig and long-skirted coat, to our own day, when, "in spite of all temptations," the chimney-pot hat remains in strict architectural relation to the chief architectural feature of our cities.

In jewellery, metal-work, pottery, inlays, in the spacing of the book-cover, the distribution of its tooling, in the arrangement of the book page and its decoration, in the form of choice type—everywhere in beautiful art we may find the architectural influence, that poetry of the constructive sense which is the common sense of art, and adapts itself to all manner of useful things, giving to each its particular and ornamental value, and insuring it harmonious place and relationship in the great household of design.

I believe that in any period or country where exists anything like a distinct and living architectural style we shall find its influences coming out in all sorts of ways, harmonising and controlling invention, and bringing all the arts of design—which really owe their existence to architecture—into relation with itself. In countries like Japan, which (perhaps owing to its liability to constant earthquakes) have no stable or noble monumental type of architecture, it is noticeable, in spite of extraordinary artistic skill, there is a tendency towards triviality in the design of accessories, but even here it is noticeable how the form of their main constructive material—the bamboo—constantly reappears as an element in design.

It is curious to trace the lingering survivals of architectural relation still clinging about such unrelated art, as much modern sculpture (or statuary) and easel painting—I mean in the pedestal—as essential to the one as the frame moulding is to the other. Both sculpture and painting have set up a supposed independent existence—have gained, perhaps, a decree of judicial separation from architecture, if not a decree *visi*. But it has only been for the sake of convenience and to meet certain commercial conditions, and thereby it becomes a grave question with artists, with all who care for beauty and harmony in art and life, how far a unified art is possible under the rule of the huckster and the speculator.

It is certain in any case we shall never be able to build up a noble style in architecture and bring about a harmonious unity in all the arts of design without sympathy and co-operation, without some mutual understanding of each other's work and aims on the part of artists, whether their work is constructive or graphic; but I think of late years there are not wanting signs of a strong and growing feeling in this direction which is beginning to tell upon contemporary work.

At the conclusion of the paper, Mr. H. H. Statham proposed a vote of thanks, which was seconded by Mr. R. Phené Spiers, F.S.A., and supported by Mr. A. B. Pite and Mr. Hooper, to Mr. Crane, who replied, and the meeting adjourned or the recess.

DURHAM CATHEDRAL.

THE following report of the address on the history and architecture of Durham Cathedral, by the Rev. Dr. Greenwell, delivered at a meeting of northern archaeologists in the building, is taken from the *Durham Advertiser*.

The President at the outset remarked that he did not intend to say anything about the ecclesiastical portion of the history of the church of Durham, but intended to entirely confine himself to the facts connected with the dates to which the several parts of the buildings were attributed. Those dates, although not many, constituted, he thought, a perfect history with regard to the whole building. There were very few cathedral buildings in England with regard to which they had got so many ascertained dates, but in Durham they could fix the precise date of every part of the church. Durham was, as compared with York, Chester, Lincoln and those cities which were in existence before the Roman Conquest, of comparatively late time. He mentioned this in order that they might not get into their minds, although sitting in a very ancient building, that it represented a very ancient site. That there was some Roman occupation here might, he thought, be regarded as almost certain. In the cathedral churchyard a Roman altar was found, and a few Roman coins had been found on the other side of the river. In the tower of St. Oswald's Church the remains of a pre-Conquest cross were found. He did not understand how that could have got into the tower—it was simply used there as a building-stone—unless it had been found more or less near the site of the church, and he thought that pointed to there having been before the Conquest not only some settlement on the opposite bank of the river, but also that there was a church there with its accompanying cemetery. All this, however, did not imply that there was any great Roman settlement, such as at Lancaster and Chester-le-Street, but there was a Roman occupation, probably of a trifling nature. When they spoke of Durham they must go back to the parent of Durham, Lindisfarne, for without Lindisfarne there would have been no Durham. Dr. Greenwell then referred to the introduction of Christianity into the North of England from Lindisfarne, of the invasion of England by the Norsemen, in consequence of which the ecclesiastical foundation was obliged to leave Lindisfarne. They came to Chester-le-Street no doubt on account of the latter being a Roman settlement, and where they probably thought they would be afforded sufficient shelter against succeeding incursions of their enemies. They, however, found Chester-le-Street not sufficiently strong, and commenced a series of wanderings, ultimately settling at Durham in 995. Before that the plateau on which the cathedral stood was unoccupied, there being, they were told, merely a little cultivation upon the centre of it. Well, in 995 the bishop brought here the congregation of St. Cuthbert, a number of ecclesiastics to whom was entrusted the body of the great St. Cuthbert, and it was to the various offerings and donations and gifts made to the saint that the church of Durham owed its wealth. Aldhun at once commenced to build a church which was finished in 999.

Aldhun's Church.

The chronicler of the church spoke of it as a much smaller and less important building than the present church. How large Aldhun's Church was and where situated they could not tell, but no doubt it occupied a portion of the great area upon which the present church stood. He (the President) thought it occupied more or less of the nave, and by careful and systematic excavations it was quite possible that the whole of the ground plan of the old church by Aldhun might be laid bare. No one knew what the pick and the spade might reveal. The pick and spade were in every way the most valuable aids to history. He had had a great deal to do with these useful tools, and knew what controversies they had set at rest, and how many speculations had been shown to be without any basis at all. The Norman Conquest exercised a great influence over England, and the first Bishop of Durham after that was Walcher, who was put to death at Gateshead, probably owing to a racial rising there. This put a stop to the alterations the bishop had intended to have made in the church at Durham. There were, he believed, some remains of Walcher's buildings still in existence to the south of the present chapter-house. The whole character of the walling referred to looked more like pre-Conquest walling than the better work introduced after the Conquest, and was no doubt done by native workpeople. Now came the great bishop to whom the present cathedral church of Durham was due, William St. Carleph, brought up as a monk in a Benedictine monastery. He came to Durham in 1081, and found a society of ecclesiastics extremely repugnant to his notions. Carleph had naturally a strong prejudice against married clergy, and determined to dispossess them. They were given the offer to remain under the new system and to become monks in the newly-established monastery, but they naturally preferred to go away with their wives and families, and were established by Carleph at various

such as Norton, Auckland and Darlington, where they allowed maintenance for the remainder of their lives. This great bishop established the Benedictine monastery of Durham and went into exile in 1089 and remained until 1092. During the time of Carileph's exile the refectory was built, the lower part of which still remained in the very remarkable crypt, which extended under the whole length of the old refectory—now a portion of the library; and besides that, another crypt contained within the Deanery, and forming part of the cellars of it.

William St. Carileph's Church.

Carileph returned from exile, and in 1093 determined to build a new church of larger dimensions, of more magnificent construction, and altogether one more worthy of the great monastic house which he had established here. Thus on August 11, 1093, the foundation-stones were laid. A great question had been raised as to what was done with Aldhun's Church. Simeon stated that Carileph gave orders to have Aldhun's Church destroyed before he commenced to build his church. A contemporary writer stated that before the church of Carileph was built he had destroyed Aldhun's Church. That, the President thought, must be taken with a great number of grains. At that time they had in the monastery the full complement of monks, with a full staff of officials, all ruled over by the Prior. There would be the full number of services going on, and where could they be held but in Aldhun's Church? His opinion was that until Carileph's Church was so far completed these services were held in Aldhun's Church, and then at a time when the new church had reached a certain stage, and capable of affording accommodation for the holding of the requisite services, the old church was taken down. That he put forward as a reasonable speculation. Carileph, as he had said, laid the foundations of his new church in August, 1093, and how far he carried on the work it was perhaps not possible to say, but they were told by the chronicler that when Flambard, the next bishop, came to the throne, he found the church finished up to the nave. Mr. Hodges would point out to them subsequently the point in the nave to which the church had been built when Flambard came. The church was finished by Carileph to those great arches which supported the tower, and a certain part of the tower above. Not the whole of the existing tower. The arches on the north and south sides and the two arches on the west side must necessarily have also been finished, for they could not have put piers like those they saw without having them buttressed. They were told by the chronicler that the monks neglected the compact made between the bishop and themselves, that they were to construct the monastic buildings, and that in the interval between the death of Carileph and the succession of Flambard they went on with the church. The part he thought the monks built during the interval was the west side of the transept, and probably the roof of the north transept. Flambard, they were told, had at his death finished the nave up to the groining. Therefore he must have finished the whole of the nave. It was not built at the time of his accession to the throne and he built it up as far as the vaulting. Hence at the death of Flambard in 1128 they had practically the whole of the cathedral finished, with the exception of the roof of the nave.

He would not go into the question with regard to the aisles as to how far the church was finished by Carileph. He had his own view upon it, which was that Carileph's work comprised the whole of the outer wall of the church as high as the top of the arcade—that he enclosed the whole area of the church. Much had been said from time to time with regard to the roof of the choir. Unquestionably the great architect who planned the church of Durham intended from the first that there should be a stone groining over the choir. It was a very early example, and that any builder should attempt to put on a groining over a church of such large dimensions at so early a period has given rise to great doubts in the minds of many architects. They stated that no church of the magnitude of Durham and built at that period appeared with a stone groining, and therefore it was almost impossible to believe that the groining was put on at the time. His answer was that it was all very well to say that there was no building existing so large as Durham which had a groining on at so early a period, but why should not Durham be the first? He wanted to glorify Durham, and was perfectly justified in glorifying it to the highest extent. It was a building not only of great magnitude, but a building showing the most wonderful skill of the man who planned it. He who planned the church of Durham was an architect of the very highest capability. No Norman building could be mentioned along with it. The grand design due to Carileph's architect was one unrivalled in Norman work, and he (the President) had no hesitation in saying that had the man who planned this church lived at any other time, in the time of the highest period of Greek architecture or Mediaeval architecture, they would have had a building as unrivalled in its style as the present church was unrivalled in the Norman style. Therefore

when they had a man of such high capacity and great knowledge as the builder of that church must have been, why should he not have put on a groining, although no groined roof had been put on elsewhere up to that time? There was no reason whatever, and he maintained that the architect of Durham projected and put on the Norman groined roof over the choir. But they had got historic evidence for that assertion. In the year 1104, during the time the church was being built under Carileph, the shrine of St. Cuthbert had been transferred to a temporary building in the cloisters, and which building remained until the time of the Reformation. One of the first deans after the Reformation very foolishly destroyed it. It would have been extremely interesting had that little building remained standing in which the shrine rested until, as history told them, the church was so far completed that the shrine could be moved to the place prepared for it. A very interesting account was given of all that occurred when the shrine was translated to Carileph's Church—a full and elaborate account of the appearance of the body and of the coffin in which it was enclosed. The chronicler told them that the work was so far completed that the shrine could be transferred to its new place in the choir, but those entrusted with the task found very great difficulty on account of the woodwork which supported the roof at the place. They did not know how to get that woodwork down lest any great damage might be occasioned thereby. Now, the woodwork which was said to have supported the roof must have been the centreing of the span of the groined roof. Had it been an ordinary roof of wood there would have been no occasion to remove any wood that supported it. Therefore when the chronicler talked about the great mass of woodwork supporting the roof which had to be removed, there was no doubt it was the centreing of the groined roof. Well, St. Cuthbert came to the aid of his people, and the next morning the prior, to his intense astonishment and delight, found that the woodwork had been taken down, laid upon the floor of the church, and that without anything whatever having been damaged. Having further referred to the great difficulty of putting on the groined roof at that portion of the choir designed to receive the shrine, and the great mass of wood necessary to accomplish it, Dr. Greenwell went on to say that they might come to the conclusion that in the year 1104 the choir of the church was finished so far that a stone groined roof was put upon it.

The Roof of the Nave.

With regard to the nave, he had already told them that at the death of Flambard the latter had finished the nave up to the groining; therefore the only portion of the church which required completion was the roof of the nave. Now it had been asserted, and was still asserted by many, that the roof of the nave was a thirteenth-century roof. This seemed to him to be utterly opposed to all knowledge of architecture. Such an assertion was perfectly incomprehensible. The roof bore the most unmistakable evidence of belonging to the early part of the twelfth century. But here again they had historical evidence. They were told by the chronicler that in the interval between the death of Flambard and the accession of Galfird Rufus in 1133, the monks completed the nave. Now there was nothing to do in the nave but to put the roof on, and therefore he thought they might fairly say without doubt that the roof under which they were sitting was built in the interval between the death of Flambard and the coming in of Rufus in 1133. The roof bore evidence which architecture could point to to show it was of that date. They had thus practically got the whole of the church finished as it was originally intended to be.

The Chapter-house.

So far as they knew Rufus did nothing in the church itself, but in his time—between 1133 and 1140—the chapter-house was completed. They were not told that the chapter-house was commenced by Rufus, in fact he thought there was reliable evidence in the architecture that it belonged to two quite different periods. One part of it, the arcade, which ran round the whole of the chapter-house, was of an earlier period. He should think it not improbable that it was commenced by Flambard, for they were told that not only did Flambard go on with the church, but also did something towards the other buildings connected with the church. They might therefore say that the chapter-house was commenced by Flambard and finished by Rufus, because the roof and west wall, together with the mouldings and a very beautiful doorway still existing all bore very evident signs of being of the date of Rufus. Besides, in the doorway of the chapter-house there appeared the badge of Stephen, who reigned during the time Rufus occupied the see of Durham. The chapter-house, as they knew, was unfortunately almost entirely destroyed in 1796, under the advice of Wyatt—a very stupid and wicked thing to do, more especially when they considered that there was no reason whatever for it. The chapter-house was now being restored to its former size in memory of the late Bishop Lightfoot, and on June 13 next would be handed over by the restoration committee to the chapter.

Bishop Pudsey's Work.

They next come to a very great builder, Bishop Pudsey, who occupied the throne of Durham from 1152 to 1195. During the reign of Pudsey architecture was altering and making very rapid strides indeed. Pudsey intended to erect no doubt what was a lady chapel at the east end of the church, and there was a traditional story that St. Cuthbert would not allow Pudsey to build a lady chapel so near to where his own bones rested, and caused great fissures in the walls. Pudsey never completed the building at the east end. Another story had it that Cuthbert appeared to Pudsey and told him that he could build a chapel anywhere else, and Pudsey acting on that advice built the Galilee chapel at the west end, which still remained, a beautiful specimen of the transitional work of about the year 1180. Pudsey also built many churches and had two architects, Roger and William, who were called engineers. They were men of very high artistic feeling and erected most beautiful and charming buildings, but they did not possess that engineering skill which the great architect of Carileph possessed. The buildings designed and erected by Roger and William were unfortunately not constructed with a due regard to the engineering part of the work, and all soon showed signs of shrinking. As regards the Galilee, they did not know what its foundations were, but in its erection so little regard was paid to its construction in regard to the thrust of the arches that it bulged out towards the west, and it was only in the time of Cardinal Langley that that was stopped by the erection of enormously strong buttresses against the west end. The Galilee was without doubt one of the most exquisite and beautiful buildings of its time in the country. They now returned to the east end of Carileph's Church, the foundations and upper structure of which had been disclosed by the recent excavations. They knew from an appeal made by Prior Melsonby, in the early part of the thirteenth century, that in the time of Pudsey there were undoubted signs of shrinkage, and that the east end was in a very insecure state. Probably Pudsey had intended to rectify that by building a chapel at the east end, but he (the president) was afraid that owing to the imperfections of Pudsey's architects he would not have been able to do so. The condition of the east end became so bad that steps were taken by Bishop Poore, translated from Salisbury, to take down the east end and replace it.

The Nine Altars.

Poore collected the money for the work, but died before he had time to commence, and it was not until 1242 that his successor, Bishop Farnham, and Prior Melsonby, commenced the present exquisite thirteenth building, known as the Nine Altars. It possessed a very strong resemblance to the Nine Altars at Fountains, erected about the same time. Durham was a finer building; in fact, he did not think that a finer building of that period was to be found anywhere in England. Fortunately the name of the architect of the Nine Altars was preserved. It was very rare indeed that an architect of old times had left any record of his own name. He was satisfied to leave the magnificent buildings themselves to testify to his memory. This showed how modest and unassuming they were, very different to many persons of the present day, who were far too fond of parading themselves. If any person of the present time were to put up a building like the Cathedral Church of Durham, he would take good care that he should be known to the world for all time; but not so these great masters of the past. However, the name of the architect of the Nine Altars was preserved, and it was discovered by a mere accident. Many years ago, when making a catalogue of the seals, of which the dean and chapter possessed an unrivalled collection, he (the president) took up a deed, which attracted his attention. In such documents the Nine Altars was always referred to as the *Nova fabrica*, and in this conveyance in the chapter library there appeared as a witness the name of *Magister Ricardus de Farinham, tunc architector novae fabricae Dunelm.* In the arcade there was a number of heads of bishops, kings and queens, but there was also a head which was undoubtedly a portrait, with a close-fitting cap, similar to those in which architects of that period worked. This he believed to be a portrait of Farnham, the architect of the Nine Altars, and a very characteristic and striking portrait it was. The Nine Altars was commenced in 1242, and, judging from the date of the last indulgence granted in connection with the new work, it was probably not finished before the year 1280.

The Neville screen was a very beautiful piece of work, now despoiled of the numberless figures which at one time filled the niches, and added greatly to its beauty. It was proposed a few years ago to replace these figures, and he was very glad that that was not done, because, in the first place, he did not think it right to interfere with the work of a great artist. A great artist planned that screen and designed figures for it, and for somebody else to insert other figures seemed an unwarrantable interference. Besides that he did not think any man of the

present day was sufficiently skilful to work upon medieval lines. One of the designs submitted for filling the niches was utterly ludicrous. A little better one was projected, but fortunately not carried out, and the screen remained as they now saw it. The screen was commenced in 1372 and finished about 1380, and was called after John Lord Neville of Raby, who bore a considerable portion of the cost.

Bishop Hatfield, who reigned from 1345 to 1381, built the tomb and bishop's throne during his lifetime. It was a very remarkable throne, and for size and magnificence no other bishop's throne could be mentioned with it. It was the throne of the bishop in his palatinate probably, and not in his episcopal capacity. The former position fully justified Hatfield in erecting such a fine example of the work of that period. Having referred to the terrible destruction that had gone on in comparatively late years by taking out the old windows and putting in new ones, the president alluded to the additions made by Cardinal Langley to the Galilee. Not only did he strongly buttress the west end to secure the building, but he also erected two additional shafts and put on a new roof. The finding of the original bills had destroyed the belief that the added shafts in the Galilee were put up by the original architect. They were added by Langley, as proved by the bill for the stone, which was obtained from a quarry on the Browney. The centre tower, originally Norman, was twice burnt down, in the thirteenth and fifteenth centuries. In 1455 it was in so ruinous a condition that an appeal was made by the then prior for money, because he said it was actually coming down. Therefore that part of the tower above the arches was later than the year 1455, and was due to the appeal then made. That completed the church.

The Cloisters.

The cloisters, although terribly mangled and mauled now, still possessed to a certain extent very ancient characteristics. They were commenced in the time of Bishop Skirlaw, and were completed by Langley in 1418. The kitchen was commenced in the year 1368. It was now in its entirety and was a very fine specimen. There was no kitchen equal to it except the great kitchen at Glastonbury. The dormitory was finished in 1404, and to a large extent remained in the state in which it was built. It had a grand massive solid oak beam roof. They would scarcely believe it, but it was quite possible to believe anything, more particularly of deans and chapters. Well, the dean and chapter, when they fitted up the room for a library not so many years ago, actually proposed to take the fine old roof off and replace it, with what? A pitch-pine roof. It was really almost incredible that such a proposition could have been made, but it was made, and the roof was only saved by the strong representations of Mr. Hardwick, the architect, a man of high reputation and large means, and whom the dean and chapter were obliged to listen to. Mr. Hardwick said:—"I will not only not do the work, but I will make known throughout the whole of England the deplorable piece of destruction you are going to perpetrate." Fortunately the roof remained to the present day, and was one of the most massive and finest roofs they could possibly see anywhere.

An Architect's Theory.

Mr. Hodges, of Hexham, described the cathedral from an architectural point of view. He said, living at the end of the nineteenth century, when they were used to the erection of buildings cheaply and rapidly, it was difficult for any person to grasp in his mind the conditions of life, and the state of architecture and building construction when Durham Cathedral was erected 800 years ago. The only thing they saw now, as the monks saw it, was the massive line of the Norman architecture, which was absolutely of permanent duration. Mr. Hodges then proceeded to speak of the state of architecture in England when Aldhune's Church was built. The position of this church was probably the nave of the present church. Carileph began his church on a most ambitious scale in 1093, but was doubtless hampered by the peculiarities of the site. The proportions of the church were absolutely perfect, but the nave was a little short for a Norman nave of that period. This was doubtless due to the exigencies of the site. The plan of Carileph's church was laid down utterly regardless of cost. At the east end Carileph would have to go down from 20 feet to 22 feet to put in solid foundations to support his church. The plan consisted of a long nave, transept and choir, ending in three apses. There was an apsidal end to each of the aisles, and an apsidal end to the choir itself. It was a normal plan of a Norman church of that period. A large number of churches were built on this plan in England and Normandy; but in England not a single one remained unaltered, and in France only four remained. Of churches in England, with solid apses to the ends of the aisles and square outside, only two other examples, besides that of Durham, remained, namely, Peterborough and St. Alban's. It was customary and convenient to have apses at that period behind the altar, and they were adopted generally. Durham was a rare

case where the original design was carried out within a reasonable period, and this was only done by the great wealth of the church and the determination of one bishop after another that the cathedral should be built. He thought this arose from a great admiration for Carleph's design. Thus Durham was the only complete Norman cathedral in England; in fact, there was no exaggeration in saying it was the finest specimen of Norman architecture in the whole world. Mr. Hodges then went minutely into his subject, explained the necessity for erecting that most beautiful specimen of Gothic architecture in the world, the Nine Altars (namely, to afford accommodation to the pilgrims visiting the shrine of St. Cuthbert, and to provide chantries), and in the course of his address said the design of Carleph's church was not only one of great ambition and of great magnitude, but one of great harmony—one of those designs in architecture which the longer they looked at it the more pleased they became with it, and the more thoroughly satisfied that everything was right about it, and everything in proportion.

After visiting the site of the recent excavations, those in attendance proceeded to the chapter-house.

Mr. Hodges said that in the Middle Ages there were practically two orders of clergy, called the regular and secular clergy, and each had a chapter-house attached to their church. There were two distinct forms of chapter-houses. The monks adopted the square form with column and vaulting, dividing it into so many compartments. The seculars, in a general way, adopted the octagonal form. At Durham they had a form not at all uncommon with an apsidal east end, and which in its original condition was the finest example of that form remaining in England. It was built from 1130 to 1148, in the time of Galfrid Rufus, and was complete with its vaulting. It survived throughout the whole of the Mediæval period down to 1795, when by order of the then Dean and Chapter the eastern end was taken down. They built a wall across the western end, made a flat roof, stoothed and plastered the walls, and laid a boarded floor, and for what? To make a comfortable room. That was the condition of the chapter-house until four years ago, when it was decided to rebuild it as a memorial to the late Bishop Lightfoot. Of course it was a matter of opinion as to the desirability of reproducing a thing which had been destroyed. Some people might hold one view, others another, but he thought there could be only one uniform opinion by unprejudiced persons, namely, that when an attempt was made to reproduce anything which had been destroyed it ought to be done honestly. He was sorry to say that the chapter-house had not been honestly reproduced. It was neither the Norman chapter-house left by the monks, nor the chapter-house destroyed by the canons in the last century, nor was it the chapter-house left to our times. It was neither one thing nor another—neither fish nor flesh nor good red herring. It was in a general way a hash. Mr. Hodges then went into detail respecting the windows in the old chapter-house, and proceeding, said he thought the Dean and Chapter ought to have taken care that the chapter-house was reproduced in a proper manner. It had been for a very long time in hand, and had cost a very enormous sum of money, more than it ought to have cost. It was not for him to go into the reasons, but he thought as members of the ordinary English public they ought to have demanded that the chapter-house was reproduced according to the Norman design. When they came to the vaulting of the apse, which was the crowning feature of the old chapter-house, he was sorry to tell them that the vaulting had been made a complete mess of. If they went into the chapter library they would see two water-colour drawings made by old John Carter, a great and accurate draughtsman of last century. Carter gave two views of the vaulting, and they agreed exactly with the original plan. Mr. Hodges gave a technical description of the original vaulting. The original was a very nice vaulting, which did not look out of proportion or inharmonious. The present vaulting was all wrong; it was ugly in itself, and had an offensive appearance. Altogether the whole effect of the building was entirely spoilt by that bungle. How the thing could have occurred it was difficult to understand, and he hoped every person who spoke of the chapter-house would not hesitate to say what a mess had been made about the vaulting of it.

"A Member of the Chapter" writes to the *Durham Advertiser*:—We understand that the objections Mr. Hodges made referred to the vaulting at the east end of the chapter-house. The chapter architect has followed the usual Norman rule for vaulting, not following Carter's drawings, which give a form of vaulting unknown elsewhere in Norman architecture. The keystone of the old vaulting, subsequently found, corroborates the truth of Carter's drawings, but had the chapter architect followed it in defiance of the usual rules of Norman building, other objections could have been made as to the way in which the groining would have cut across certain capitals in a form not square to them. But these are matters of detail which architects must settle amongst themselves.

Mr. Hodges's reply was as follows:—I feel it is incumbent

upon me to reply to the note by "A Member of the Chapter" appended to your report of my remarks in the chapter-house on the 9th inst. I may divide the reasons given in that note for the way the vaulting at the east end has been carried out into three, viz:—

1. That "the usual Norman rule for vaulting" has been followed.

2. That the vaulting as it actually was was "unknown elsewhere in Norman architecture."

3. That had the vault been reproduced as it was before, the ribs would not have taken lines square with the capitals or corbels from which they sprang.

Your correspondent admits that the original keystone proves that Carter's drawings are right, and it follows therefore that the vault in the apse as executed is wrong.

The first statement is based on a false assumption, viz, that there was a rule for the vaulting of apses in Norman times which was universal. Anyone who knows anything of the architecture of the Middle Ages knows that by far the greater part of the Norman churches as originally built, both in England and France, or wherever the various phases of the Romanesque style were in use, were either subsequently altered or superseded or totally destroyed. It follows, therefore, that we know nothing of the nature of the vaults in nine-tenths of them, or thereabouts, probably a greater proportion. A rule, or rather an assumed rule, based on such insufficient data is of course valueless.

Secondly, that the vault, as we know it was, "was unknown in Norman architecture." If we admit this or rather admit that it was unknown, except in the case of Durham chapter-house, is that any reason why it should not have been reproduced as it was, when what it was was clearly known?

The fact is, the vault was a Late Norman vault, as late as 1140, and it was on the lines of the vaults of apses adopted by the builders of the succeeding century, as in the apse of Westminster Abbey. Herein lay its value. It may have been the first vault of the kind erected in England on these lines, and if so was especially interesting, and shows, as other things show, that Durham was in advance of many other places in its architecture.

The third reason given, that the ribs would not have sprung squarely from the corbels in the apse had the vault been reproduced as it was, is an equally unsound one.

It is only necessary to look into the cathedral to see that the whole of the diagonal ribs in the nave, transepts and aisles spring at various angles to their capitals or corbels. If vaulting ribs had always to spring squarely to the line of support there would be very little vaulting anywhere. Ribs spring at all angles, and are not considered eyesores in any sense. The slight skew of the line of the ribs in the chapter-house apse would never be noticed.

To sum up, we find the position thus:—A vault had to be reproduced, the form of which was known from two views and a plan, which showed that it was an excellent form of vault for its position, and was certainly an improvement on an assumed general earlier form, though that that form was general, or was earlier, was by no means certain. It is, however, certain that it is inferior. But why should not the vault have been reproduced as it was before? There was no doubt about it, and it was generally understood that the chapter-house was to be, when rebuilt, an exact replica of the original one as far as all the Norman work went, and why such an excellent and valuable example of a vault over an apse as was known to have been there was changed into the manifestly inferior form is a question which must necessarily occupy the minds of all people of taste and knowledge.

It is quite clear that the very foolish reasons given in the note referred to do not answer this question in the least degree.

LEEDS THORESBY SOCIETY.

THE Leeds Thoresby Society made one of their periodical excursions on Saturday afternoon for the purpose of investigating Esholt Old Hall and Esholt Priory, near Apperley Bridge, together with the old hall in Calverley village and Calverley Church. On arriving at Guiseley, says the *Leeds Mercury*, the party were met by Mr. S. Margerison, who acted the part of a most efficient cicerone throughout the expedition. Two waggons were in waiting, which conveyed the members straight to Esholt Old Hall, the first place of interest to be explored, passing through the beautiful Esholt Springs, so-called from the spring wood that grows there in great profusion. Boggard House was also sighted. This is popularly supposed to be haunted by a ghost of a somewhat original character, seeing that its invariable custom is to invite all comers to "laike at taws!" Esholt Old Hall, with West Esholt, is a separate manor from East Esholt, where Esholt Hall proper is situated, the residence of the Stansfield family. Formerly both estates belonged to the Wards of Guiseley, but

at a somewhat uncertain period the Old Hall portion was separated, possibly through marriage, and when the part now known as Esholt Priory became a nunnery, the Old Hall remained in the hands of the Wards until a few generations later. The Shireburnes, of Stonyhurst, then came to own the estate, and at the death of the last representative of that family, Sir Nicholas, in 1710, the estate passed to his daughter, Mary, Duchess of Norfolk. The exterior of the hall is more interesting than the interior. It was chiefly built during the transition period of the sixteenth century, and has remained practically intact. The inside, like most houses of the period, has suffered considerably through being divided into separate tenements and altered to suit modern ideas and requirements. Esholt Priory was next visited, and for over an hour the members, through the courtesy of the Misses Crompton-Stansfield, inspected the more ancient portions of the building and the numerous interesting relics that it contains. Amongst the latter may be mentioned an antique diamond and pearl watch; a beautiful ring set with stones, formerly belonging to the Prioress, a small cross in silver, being visible on one side; a copy of the *Leedes Mercury*, February 17, 1747; some valuable old Latin manuscripts and charters, including the gift of the advowson of Belton, grants to the Priory by the Wards and others; several antique dress swords; ancient Japanese needlework, and the nunnery table. In the oak-room are portraits of bluff King Hal and Edward VI., and numerous family portraits. Over the fireplace is the monogram of Sir Walter Calverley, the builder of the house, and some beautiful hollyhock carving. The adjoining room, known as Lady Julia Calverley's, formerly contained some beautiful pieces of tapestry along its panels, worked by that lady, and it is noteworthy that Sir Walter in his diary mentions that this work took his wife three and a half years to complete. Several old mirrors also adorn the walls, and some china painted with the armorial bearings of the Rookes, who were among the ancestors of the present owners. Some beautiful water-colours of local scenery, by Cox and other artists, are further attractions. On the way to the cellars, which form the most ancient portion of the Priory, the party passed to another room, containing a magnificent set of old china. In the cellars are the only remains of the Priory buildings, except an inscription outside. Two of the windows consist of lancet-headed lights. The courtyard was then inspected, and a short time was spent in examining an inscription therein of the last prioress, whose name, "Ilisbet Pvdsa, P" (prioress), stands out clearly. Mr. Margerison, at this juncture, gave a brief account of the families who had successively occupied the estate, and of the ancestors of the present holders. As time was getting on the party, betaking themselves again to the waggons, drove off to Calverley by way of the fine old avenue of elms which fronts the mansion, passing Nunwood, through Apperley Bridge, where some account of the diverting history of "Prophet" Wroe was given, through Calverley Woods on to Calverley Old Hall. This hall was the ancient residence of the Calverleys of Calverley. The chapel, the dining-room and withdrawing-room, with their relics of old oak, were inspected. The most interesting room is that in which the "Yorkshire Tragedy" was committed. Mr. Margerison, after giving a brief outline of that well-known crime, narrated some of the family history. The church was then visited, and its various features noted. Some small portion is of the Norman period, but it is chiefly of the Decorated style of architecture. The ancient incised memorial cross slabs which were found during the restoration of the church in 1870 were pointed out. The registers, particularly the entry of the two murdered children in the "Yorkshire Tragedy," were likewise viewed. During the day a tombstone of a former vicar, the Rev. Christopher Holt, who died in 1741, had been found in the village pinfold and brought to the church prior to the arrival of the visitors.

NORTHERN ARCHITECTURAL ASSOCIATION.

ON Saturday afternoon last an outdoor meeting of this Association was held, when thirty-eight members attended. Assembling at Jarrow, the first place visited was Christ Church, where the Rev. T. F. Paterson received the members, who examined the new chancel screens and fittings recently erected in memory of the late Lord Northborne, from designs by Mr. Crawford Hick, architect, of Newcastle. The party next proceeded to the old church (St. Paul's), which is one of the most ancient edifices in the kingdom. Embarking on board a steam launch, kindly placed at their disposal by Messrs. Brigham & Cowan, of South Shields, the members proceeded down the Tyne and viewed the lighthouse in progress of erection on the South Pier, and then landed at the pilots' landing. Conveyances were in waiting, and the party drove to St. Michael's Church, Westoe, where the Rev. C. E. Adamson conducted them over the building, which has just recently been enlarged by the addition of aisles from the designs of Messrs. Hicks & Charlewood, architects, of Newcastle. Thence proceeding to the village of Westoe, the members were,

by the kindness of the Mayor of South Shields, permitted to view his residence, which was erected several years ago from the designs of Mr. J. J. Stevenson, architect, of London. Finally the party proceeded to Harton Cemetery and inspected the chapels and entrance-lodge erected in 1889, and designed by Mr. Henry Grieves, of South Shields. Lastly the party was hospitably entered at the County Hotel by Mr. J. H. Morton, after which votes of thanks to him, to Mr. J. W. Donald and Mr. H. Grieves were carried by acclamation, as also was a similar compliment to Messrs. Brigham & Cowan and the Mayor. Among those present were Mr. Jos. Oswald, president; Messrs. F. W. Rich, vice-president; A. B. Plummer, hon. secretary; J. T. Cackett, hon. treasurer; Wm. Glover, H. C. Charlewood, J. W. Taylor, H. G. Badenoch, H. Grieves, J. W. Donald and others.

GENERAL.

Mr. Holman Hunt will deliver the Romanes lecture on Thursday in the Sheldonian Theatre, Oxford. His subject is "The Obligations of the Universities of England towards Art."

Mr. Pearson, R.A., has reported to the Peterborough Restoration Committee on the state of the west front of the cathedral. He expresses surprise that the front resisted the recent storm, and says it is absolutely necessary that its repair should be undertaken at once if its various features are to be preserved. The two main piers, he adds, lean over 2 feet, and insecurity is manifest in many places. As a precaution against accidents he suggests that the northernmost archway should be fenced off.

Arundel Church is not yet free from the attacks of the "weevil." Recently it was found necessary to construct a new roof over the nave, owing to the devastations of the beetle, but the aisle and transept are now being destroyed.

A Mosaic Pavement has been revealed at Silchester within the area of a building which, from its size and position, was likely to have been the residence of some man in authority. The inner part of the mosaic represented a figure subject, but too little remains to allow of any interpretation.

Dr. Waldstein, as Slade Professor of Fine Art, will deliver his inaugural lecture in the Senate House, Cambridge, on Saturday, June 8. The subject will be "The Study of Art in Universities."

The Scarborough Guardians have decided to send the six sets of plans received for the Workhouse Infirmary to the Local Government Board for adjudication.

Mr. W. E. H. Lecky has been appointed a trustee of the National Portrait Gallery.

The Surveyors' Institution held their annual dinner on Monday at the Holborn Restaurant, Mr. Daniel Watney, president, in the chair. It was stated that the Institution at present included 2,367 members, and that the annual income was 7,100*l*.

A Design by Mr. R. Clamp, of Woking, has been adopted for the new Methodist Church at Waverley Park, S.E.

Messrs. Giles, Gough & Trollope have been successful in the competition for the asylum at Hendon, for the Central London Sick Asylum District.

The Argentine Republic have invited designs from architects throughout the world for a new building for the use of the Argentine Congress. Three prizes, one of 20,000 *dols.*, one of 10,000 *dols.*, and one of 5,000 *dols.*, are offered for the most satisfactory designs, but as the prizes are to be paid in paper currency, which is worth 24 cents on the dollar in gold, the prospect of success is not encouraging.

The Yorkshire Water-Colour Society is the name chosen for a new society proposed to be formed at Bradford for promotion of this branch of art, and to be affiliated with the Yorkshire Union of Artists.

The Seventeenth Annual Exhibition of pictures by local artists has been opened at Nottingham Castle Art Museum. The works shown are in excess of the usual number.

The Duke of Norfolk will be invited to undertake the office of mayor of Sheffield next year, when the new Town Hall will be opened.

At a Special Meeting of the Royal Scottish Society of Arts the following resolution was adopted:—That in the opinion of this Society the time has now arrived when a decimal system of weights and measures (preferably the metric system or a modification of it) should be made compulsory by an Act of Parliament, to come into force as early as practicable after January 1, 1900.

Mr. J. W. Waterhouse, the painter, was on the 23rd inst. elected a Royal Academician.

The Architect.

THE WEEK.

ON Wednesday the Liverpool Corporation approved of the recommendation of the finance committee to complete the series of sculptured panels on the east side of St. George's Hall at a cost of about 3,000*l*. The work will occupy Mr. LEE for five or six years. At the same meeting it was decided to empower the library, museum and arts and technical instruction committee to obtain plans for the extension of the museum buildings on the land bounded by William Brown Street, Byrom Street and Clayton Street, and that the committee be authorised to devote to this object a sum not exceeding 200*l*. The new buildings will provide more accommodation for the museum, and also technical schools and a public hall. Sir W. B. FORWOOD said they were not now asking the Council to sanction the erection of the buildings; they simply thought it was desirable that they should obtain plans from the leading architects of the country, as the buildings would cost between 80,000*l*. and 100,000*l*. The site was, moreover, peculiar, and it would be necessary to have the aid of architects possessing experience of technical schools and museums. In doing this they cast no slur whatever upon their own architectural staff. It was also agreed that land should be granted to the DAVID LEWIS trustees for the proposed Northern Hospital which is about to be erected, as well as a sum of 10,000*l*. towards the funds.

ON last Sunday the fresco painted over the chancel arch of the Artists' Parish Church in Mount's Bay, Cornwall, was unveiled. This great picture, following the lines of the arch and angular roof, is 42 feet high and 22 feet wide, and covers in all about 300 feet superficial area. It was executed at the cost of a parishioner, Mr. BODILLY. The subject, "Our Lord in Glory," is boldly treated by the artist, Mr. J. GREGORY JONES. There are a hundred and twenty-three figures. CHRIST is represented standing on an orb, which is girdled by the crown of thorns. He is holding the banner of victory with His left hand and giving with His right blessing. A rainbow forms an arc over His head, and the nine choirs of angels, illuminated with rays of light, form a continuation of the halo around the SAVIOUR'S body. Lower in the fresco are two full figures, the Cherubim with thuribles, and further down on either side of the arch figures of MOSES and ST. PAUL, representing the old and the new Dispensation. The walls on either side of the new oak rood and chancel screen are enriched with deep shades of orange-red in cross-key patterns, whilst the massive granite arch is divided from the fresco by repeating patterns of fleur-de-lis in gold.

In many architects' offices there is a prejudice against indian ink that is sold in bottles, arising from the weakness it displays on paper when touched with water and colour. It is, however, possible to grind a large quantity of ink, and by the exercise of a little amateur chemistry keep it in a condition that will both endure and "wash." The operation is, however, tedious, and cannot be always entrusted to a pupil. We must also admit that if there is the least carelessness in a few years the lines sometimes change their colour, and therefore it may be well to refrain from describing the process. Even partial success in the preparation of ink does not make one more favourable towards a colour-maker's bottled ink. Fortified by discoveries of weakness in our own ink we were confident we could overcome manufactured ink without any difficulty. We must acknowledge that we failed with the new "Waterproof Indian Ink" which Messrs. WINSOR & NEWTON have produced. It sustained all the tests we applied, and which were more exacting than those arising with ordinary work. There is no doubt a very pure "tusche" is employed which is free from the adulterations which we believe to be the main cause of the unwashableness of modern inks, for the old inks would rarely run. Whatever may be added to secure fluidity in use and permanence of line does not, as

far as our tests are evidence, injure the paper. The waterproof ink "bites," but does not sink in the paper, for with it erasing is as easy as with any other ink. It is a time-honoured belief that indian ink should be ground in the morning before commencing work. That practice is a survival from the days when architectural drawing was a leisurely occupation. The hours wasted in preparing ink cannot be spared in these rushing times, when there is hardly a moment for thought; and with ink like Messrs. WINSOR & NEWTON'S awaiting us there is really no advantage in the ancient practice. It may be left to the enjoyment of archaeologists. The Waterproof Indian Ink only needs a trial to be generally adopted.

THE report of the Board of Trade on the strikes of 1893 appeared during the week. It has been ascertained that in 1893 there were 768 strikes and 14 lock-outs, in which no less than 636,386 persons were concerned, a number greatly in excess of that in the year preceding, which was 371,799. No less than one-fifth of the disputes of the year arose in the building trades, but happily the people engaged in them were not numerous, being only 2.8 per cent. of the total. But they must be considered as successful, as concessions to them were made in 46.4 per cent. of the disputes, which mainly arose out of questions of wages. It has been calculated that in 1893 the aggregate number of working days lost by the individuals affected was 31,205,062. The average number of days lost per individual was thus 49.7, or about one-sixth of the total working time of the whole year for each of the individuals. It is absolutely impossible, however, to determine what is really lost, and how much may simply be wage-earning deferred to a later period. But it can be shown what the money value of those lost days would have been if turned into labour. The general average value of each day's work included in the above figures would probably be about 4*s*. 3*d*., which would give an aggregate wage value to the periods of stoppage or of suspended labour of 6,581,075*l*. An estimate worked out in proportion from actual wages figures paid by a considerable number of firms concerned in the disputes gives a total of 6,603,135*l*. Returns supplied by employers show that in the case of 488 firms the estimated value of fixed capital laid idle was 16,160,325*l*., while in 373 firms the rateable value of the property laid idle was 710,239*l*. Four hundred and twenty-eight firms report that the total cost of closing down and restarting their works, and paying fixed charges during stoppage, amounted to 344,858*l*.

SETTLEMENTS on the north and east walls and in the north-east pier of the tower of the church of St. Mary de Laura, New Shoreham, have been observed, causing great anxiety to those interested in the preservation of this most beautiful church from further dilapidation. The churchwardens are in correspondence with a firm of architects with a view to obtaining an early report upon the condition of the tower, in order to arrest further mischief. The works are likely to be costly, and it is doubtful whether the subscriptions from Shoreham will defray the expenses. A "Breton Fair" in the town is about to be held in order to obtain some additional aid.

THE Bill for the licensing of architects does not appear to be yet signed by the Governor, and it is not therefore operative. Anyone who knows the history of New York speculative building can understand, says *Architecture and Building*, why a license for architects would not be received with favour. The improvement of the last ten years in this class of buildings has resulted from the advanced stand taken by good architects in private work; and it is well understood that a law which creates "licensed architects" will interfere materially with the employment by builders of cheap draughtsmen, and that it will be found essential to the sale of buildings to be able to assure customers that they are from the designs of "licensed architects," just as they now commend their exposed plumbing and other features which were first advocated by architects of advanced ideas. This law is further reaching in its influence than appears from reading its provisions, and its approval by the governor will mark a step in advance in American architecture.

TESTS OF CONSTRUCTIVE MATERIALS.*

IN connection with the Universal Exhibition of 1889 several international congresses were held in Paris. A desire was expressed by two of them for the appointment of a commission that would undertake to give the results of the most recent inquiries into the qualities of materials employed in construction, and secondly, that would exercise its influence in order to bring about more uniformity in conducting similar inquiries than now prevails. The French Government at once perceived the importance of the proposal. A commission was organised without delay. It was divided into two sections. For the first—that of metals—General GRAS, an eminent artillery officer, was selected as chief, with M. POLONCEAU, president of the Society of Civil Engineers; M. GODRON, director of naval construction; and M. FÉNOUX, one of the general inspectors of the Ponts et Chaussées, as vice-presidents. M. GUILLEMAIN, the director of the Ecole Nationale des Ponts et Chaussées, was appointed president of the second section, entrusted with the investigation of other materials, with M. CHARLES GARNIER, the architect; M. DURAND-CLAYE, director of the laboratory at the Ecole des Ponts et Chaussées; and M. BRÜLL, past president of the Society of Civil Engineers, as vice-presidents. With them were associated many specialists as members. The sections are still, we believe, pursuing inquiries, and with a task so important it would be unwise to fix on any term for their completion. But as the results will need a proportionate period for study, the Minister of Public Works has decided on the publication of the reports relating to the work of the first session. They will occupy four folio volumes, of which the first is before us.

It is not difficult to imagine what possibilities a commission of the kind must have opened out before men who were adepts in French systematising, and who were aware that their labours were to be scrutinised by experts throughout the world. The members must have also known there was a prejudice against them arising out of the skill in literary composition which is common in France. In the formal addresses of the presidents of the sections there is much which distinguishes them from the majority of English presidential addresses, but the reports are as severely practical as any official document that would express the conclusions of English civil engineers or mechanical engineers. The "Documents Généraux" form a volume that is not only more comprehensive than the report of the Royal Commission on Iron which was prepared about half a century ago, but in style is no less succinct and business-like than that important Blue-book.

The first volume treats generally of metals and cements as employed in construction. Each general report is based on a great number of special reports, which will be printed in succeeding volumes. As everybody knows, the qualities of a piece of metal, such as a plate or a rolled joist of iron or steel, are determined by observation or by chemical analysis or by mechanical trial. In the report the various ways of attaining the common end are described, and suggestions are offered which, if adopted, would secure a desirable uniformity, and enable the observations of one country to be of more use in other places. The general report on cements, including limes, puzzolanas, mortars and plasters, has to be treated differently. There is more variety in the materials, they can be combined in more different proportions than is possible with iron or steel, while the testing has to be of a more delicate kind, and there must be doubts about its efficiency. It is no wonder, then, that the members of the second section of the commission are obliged to say that, in the present state of our knowledge about the materials of masonry, it is impossible to point out what trials are necessary and sufficient to characterise in a general manner the cementitious products which are of good quality.

It is impossible to give an abstract in a few columns of a work which represents so much labour and is drawn from so many sources. It is essentially a book for specialists, and for those to whom the strength of materials is a subject which has interest apart from its utility. They can find

matter for consideration in almost every line. But the majority of men who are engaged in construction cannot be expected to spend time on chemical or mechanical testing of the materials they employ. They have to take them on trust, and the stability of structures in which materials were accepted in that way testifies how rarely the trust was misplaced. While, therefore, we are eager to see the knowledge of materials increased so as to comprise their molecular particularities, we must not conceal from ourselves that it cannot be always turned to account. A *résumé* of the conclusions may have, however, some interest for our readers.

Although so much importance is attached to chemical and mechanical testing of iron and steel, the report recommends that visual observation of specimens, and especially of fractures, should not be neglected. ROBERT STEPHENSON would not rely upon any examination of that kind, but men with less experience are more bold, and their expression of confidence in their own judgment is often amusing. It is not possible to lay down a system that will be adapted for all sections shown by fractures, but the French artillery have distinguished nine varieties which are marked by letters A, B, C, &c., according as the particles appear fine or coarse, uniform in size or colour, related to axis of section, &c. The observations apply to metals employed in artillery, and it has yet to be ascertained whether an analogous classification is feasible with more ductile metals. It is also suggested that more might be done to extend our knowledge of the value of resonance as a clue to defects, and an apparatus by Captain DE PLACE for that purpose is mentioned as likely to be useful.

Where tests are applied it is recommended that the specimens should be of a simple geometric form, such as a cube, cylinder, parallelopiped, and that pieces with "faces rentrantes" should be always avoided. Five specimens alike in size and form should be used, and the average of the results from them adopted. About the conditions of conductivity of heat and electricity the report can afford no addition to what is known, but it is recommended that the method of cooling or *refroidissement* should be more often applied. Exact information about corrosion from atmospheric agents, gas, vapours, liquids, and about the adherence of protective metals, as in the case of zinc on wire, is also mentioned as a desideratum.

The results of mechanical tests are said to be often no more than approximate indications, and are not to be accepted in all cases as representing the quality of the piece from which the specimen was taken. While tensile proofs are held to be necessary, it is suggested that they can be easily abused, and as they occupy much time, should be employed with moderation. In many cases a falling weight or the bending of a plate would afford as satisfactory a test. Suggestions are given about the most eligible places to cut out test pieces. In the case of castings where quality is to be exactly determined, a whole piece must be occasionally sacrificed. On the subject of testing machines for metals there is much in the report, but as they form a class which is rarely sufficiently represented in an exhibition, it was difficult for the committee to speak with precision about them. More testing has been done in England than elsewhere, but there is no mention in the report of an English testing machine, although French and American varieties are described. It is quite evident from occasional expressions that the authors of the report have not had much experience in dealing with the operations of testing, and unless we are mistaken it would not be difficult to get through some of the trials with pieces of inferior quality. But we must qualify that remark by saying that inferior iron or steel is not so defective as is commonly supposed. The report also treats of tests for compression, flexion, torsion, &c., the treatment of long and short pieces and other matters.

Shearing strains are as familiar as those of tension, and it is generally accepted that there is not much difference between them in respect of a structure. The reporters are eager that experiments on shearing should be kept up, as apparently there may be much to be yet learned about the subject. According to M. LAVALLEY's experiments, the effect of double shearing, as in the case of ordinary rivetting, is equal to '80 of the resistance to tension, but with soft steel the value was '83, and with steel of middling hardness '77, while in one case it was '63. M. DAYMARD, therefore,

* *Commission des Méthodes et des Matériaux de Construction. Première Session, Tome I.: Documents Généraux.* Paris: Imprimerie Nationale. J. Rothschild, Editeur.

concludes that in course of time the pressure of the rivet against the plate or bar may overcome the power of resistance, and Professor KENNEDY'S experiments would appear to show that that consequence was not improbable, as after a time iron and steel lose much of their elastic power under strains. There is enough uncertainty on the subject to warrant systematic trials in several countries.

The recommendations about cements are offered with extreme caution. That cement is produced in France is known to every one who lands at Boulogne, but the trade is mainly local, and is never likely to attain the importance of the English, German, or American industry. It is not to be supposed that national interests alone were kept in view by the Commission; at the same time it would be unwise to propose tests which French cement might not sustain.

When testing cement it is suggested that four samples should be taken, which should be passed through sieves with meshes of 324, 900 and 4,000 to the square centimetre. In weighing the cement the portion retained in the 900-mesh sieve, as well as the portion agglomerated by the humidity of the air after being pulverised, should be mixed with the rest of the sample. Care should be taken to keep the temperature constant and at about 59 deg. Fahr. In analysing cement all the elements should be stated. A magnifying glass should be used to observe any want of homogeneity, and if any grains appear to be foreign matter they should be analysed separately. For testing by breaking the form of briquette used in France is recommended, although it is admittedly far from perfect. As it has in the centre or waist two small concave curves, there is abrasion in that part; the German briquette is open to the same objection. The English section has no sharp curves, and in consequence the same quantity of material remains until the briquette is broken. The objection against it is that the minimum width is not so readily measured as in the French and German briquettes, but as the size of the mould is known that is sufficient. Any assistant could make an English briquette, but it needs care to mould the numerous curves of a foreign section. M. DURAND CLAYE is experimenting on a briquette in which curves are avoided except on the upper and under surface; but it does not appear to have any advantage over the ordinary English form. It was remarkable that several members of the section took advantage of the difficulty which is supposed to attend the discovery of a perfect briquette by proposing that all tests of tension should be abandoned, since if only resistance to compression were considered, the purchaser of cement would still have a guarantee of quality. But the good sense of the majority was in favour of present arrangements which are derived from English practice, and which recognise crushing as well as tensile resistance. The indifference to what has been done in this country in iron and steel, as well as in concrete, gives to the first volume too much of a speculative character. That will of course affect the success of the work, not only in this country but elsewhere. Engineers from all parts of the world come to England to complete their experience by gaining serviceable notions, and to be deprived of that advantage is a confession of weakness. Hence it is that the contents of the first volume will appear to many as only a record of the doubts and fears, as well as the hopes, which arise in the laboratory. It is true unity must be sought after in a collection of exhibition reports, and a few papers on English testing, steel beams, and cement making would be as much out of keeping with the rest of the contents as GULLIVER was among the Liliputians. French readers, moreover, could not appreciate the manner of doing business in which a product is preferred to a formula. To appreciate the volume it must be judged from a French standpoint, but when the reports that were sent in to the Commission are printed they may appear to be more in keeping with our insular notions of constructive requirements.

An Ancient Alms Chest has been restored to the Meriden parish church. It bears the following inscription, "Donum Henrici West, Anno Domini 1627. 'This chest is God's exchequer; paye in then Your almes accepted both of God and men.'" The lid was discovered in a stable. An old chained book, which probably belongs to the church, has also been found in the vicarage-house.

THE ROYAL EXCHANGE.

ON Thursday in last week the Lord Mayor, who was accompanied by the Sheriffs and the Gresham committee, which is composed partly of members of the Mercers' Company and partly of members of the City Corporation, unveiled the two paintings which have just been completed by Sir Frederic Leighton and Mr. Macbeth at the Royal Exchange. Addressing the Lord Mayor, the Rev. J. Baden Powell, the master of the Mercers' Company, stated that in 1891 it occurred to Mr. Deputy Snowden, the then chairman of the City side of the Gresham committee, that it would be advisable to fill the twenty-four panels in the interior of the Royal Exchange with paintings illustrating English history with reference to the City of London, and that the scheme should be carried out under the advice and direction of the Royal Academy. A meeting was held at the Mansion House on December 16, 1891, when Sir David Evans, the then lord mayor, Mr. Deputy Snowden, and Mr. Ralph C. Palmer represented the committee, the Royal Academy being represented by Sir F. Leighton, Mr. Calderon and Mr. Eaton. Eventually a list of subjects for the panels was prepared, and submitted to and approved by the Gresham committee, who requested Sir F. Leighton, Mr. Calderon and Mr. Poynter to assist them in carrying out the work, and the list of subjects was approved by those gentlemen. Sir F. Leighton very generously offered to execute himself and present to the Gresham committee a painting representing *Commerce between the Ancient Britons and the Phœnicians*, and the committee gratefully accepted the offer. At the same time Mr. Deputy Snowden offered to present to the committee a panel representing the opening of the Royal Exchange by Her Majesty in October 1844, and the painting of this work was by the advice of Sir F. Leighton, Mr. Calderon and Mr. Poynter, entrusted to Mr. Macbeth, A.R.A. The pictures have been painted on canvas, and have been attached to the walls, under the supervision of Messrs. Roberson & Co., by a French process called marouflage.

THE UNIVERSITIES AND ART.

THE lecture established by the late Professor Romanes at Oxford was delivered on the 30th ult in the Sheldonian Theatre by Mr. Holman Hunt, whose subject was "The Obligations of the Universities of England towards Art." He began by saying that the founder of the lectureship was proved to have been an ever-diligent and conscientious student. This was seen by the problems in science which he examined and solved, and by his faith in the inexhaustible character of research to which he ever gave witness. In addition to these attributes of a master of his craft, there was in Professor Romanes the crowning spirit which ever marked the man who was something more than a mere specialist. The lecturer pointed out that in all times there had been evils which had been inherent in the society in which art had arisen, and that a proportion of these had grown and accumulated about her while she had been overcoming other ills. He did not hesitate to avow the belief that, on the whole, French art had done great harm to the world, and that what it produced was the anti-Christ, an art which was not an emanation from love, but from hate. There were some among the nation who heard the appeal, "Come out of her, my people." These, he knew, would concur in his verdict and agree that the nation had adopted the impure entanglements of the art of previous nations, and found original delusions in addition, so that false sentiment, triviality of purpose and negation of elevated thought and beauty, and even more blamable defects, had become their own gospel to follow and preach; and, as this was easy to understand and practise, too many apostles were induced to spread it abroad. Yet it must be admitted that there were one or two naturalistic sculptors in France who had produced admirable works, and these were true representatives of her Mediæval sculptors. Our painters had done little in the branches of historic or ornamental work, because the opportunity had been denied them, and whenever English youths committed themselves to art their prospects of making their lives productive were destroyed, every foreigner that appeared being greeted with applause, while the young Englishman had to struggle against prejudice and abuse. He protested against this, for it ruined the purest and best of art under heaven, where in the happiest circumstances the career of an artist, for want of that patronage which continental governments gave, must be a hard one. It was not a case of reciprocal emulation, for no other country welcomed English artists in return, even for its future countrymen's sake. However, he would not attack this established prejudice. It was in no sense a personal question. He spoke to save their nation from the disgrace of an art which was in no sense its own. He urged that the obligations of the universities towards art were to consult the position of, and to take steps towards defending, honest English design. The schools of design were first established in accordance with Haydon's

suggestion to revive decorative and ornamental invention, which had died out altogether in the reign of George IV. It was seen that for many years they had entirely departed from their original purpose, so that the authorities at South Kensington were now wisely taking steps to prevent the inordinate training of mere canvas painters. What had been the great want throughout his term of observation had been the due cultivation of art knowledge by the rulers of their land and of those who directed public opinion. In his view there should be no insuperable obstacle to affording the cultivation wanted. He had striven to prove that literature and design were prompted by the same spirit. It followed that a good taste in literature should need little to make it an infallible judge of the sister art, but it wanted that little, and they had but too many examples to show that for want of it serious disgrace had fallen upon their nation. The system of appointing on committees of public taste gentlemen who had gone through no system of education to guard them against false conclusions was too often disastrous, as had been proved many times over in the treatment of the best sites in London, notably in the case of Trafalgar Square. They might imagine that the difficulty of selecting the proper artists to execute public works would be overcome by a public competition, as it was in Italian days. The answer was that meretricious art had not then been invented. The umpire had simply to judge between one class of honest workmanship and another. The antidote to false taste was stronger than its poison. With extensive examples of the art of all peoples and periods before him, and the knowledge that each is national, and with sound recognition of what is base and enervating in literature, no educated man should despair of understanding our art. But he must be prepared patiently to sift away delusive sophisms. The first step towards this end should be to supply graduates of the universities with a radical knowledge of the sciences employed in art, to qualify them for the development of a good judgment. All barely theoretical teaching was apt to mislead the amateur and puff him up with conceit. His study should be practical, and of matters that were sure. It might be a question how far such training should extend, but it might be at once laid down that a full acquaintance with the proportions of the human figure was required, with the laws of balance and equipoise which controlled movements and the carrying of weights. Beyond such acquirements, a knowledge of the laws of perspective should be attained, and, as the due corollary, the simple laws of light and shade might be mastered. These and some understanding of the varieties of each people's decorative design, if well established in the amateur mind, might entitle a young man to a degree which should qualify him for any post of responsibility in the control of national works or in publishing opinions on matters of art. He would only add his assurance that such a simple provision by the universities as that indicated would impart great vitality to the whole range of English art design. If art was to be living it must belong to their daily life, their national needs, and their state and their religion.

THE NATIONAL GALLERY.

THE following are the latest additions to the national collection:—Mr. Charles Butler has presented a full-length portrait of Cardinal Richelieu by Philippe de Champaigne, which he purchased at the sale of the late Mrs. Lyne Stephens's collection. Sir J. C. Robinson has given a large picture of *The Expulsion of the Moneychangers from the Temple*, by Theotocopuli, better known as Il Greco. The Earl of Carlisle has presented to the Gallery the picture of *The Circumcision*, by Giov. Bellini, which was exhibited at the New Gallery during the winter. Mr. J. P. Heseltine has given a picture of *The Virgin and Child, with Angels*, of the School of Gentile da Fabriano, early fifteenth century. Mrs. Edwin Edwards has given a picture of *A Pasturage in France*, by François Bonvin, of the modern French school. These pictures will shortly be hung in the Gallery.

The Duke of Westminster has presented to the Gallery Hogarth's celebrated picture of Calais Gate, which he purchased some three years ago. It was then thought a desirable acquisition for the National Collection, but, being without sufficient funds at the time, the director was unable to buy it. The picture is at present on loan to an exhibition at Chester.

Mr. George Salting has lent for exhibition in the Gallery six pictures of the early Flemish, German and Italian schools, viz. a portrait, attributed to Antonello da Messina, which was in the Venetian Exhibition at the New Gallery; a portrait by Christoph Amberger; another by Bartolomäus Bruyn; a *Virgin and Child*, attributed to Hugo van der Goes; a *Virgin and Child*, by the Master of the Death of the Virgin, of the Cologne school; and a portrait by Petrus Cristus, from Lord Northbrook's collection. These will shortly be exhibited on a screen in the Central Octagon Room.

The following pictures have been purchased for the

Gallery:—*The Holy Family*, by Sebastian del Piombo, which was lent by the Earl of Northbrook last year. It hangs in Room No. VII. *The Vision of St. Hubert*, by Vittore Pisano, which was exhibited by the Earl of Ashburnham in the Florentine Exhibition at the New Gallery in 1894. This is not yet hung in the Gallery. *The Descent of the Holy Spirit*, by Barnaba da Modena, hung with the early Italian pictures in the north vestibule. *Landscape, with Hunting Party*, by Van der Meulen, purchased at the Lyne Stephens sale, and placed in Room No. XI. *A Head of John the Baptist*, Milanese school, placed in Room No. IX. From the sale of Lord Clifden's collection:—*Interior of a Church*, by Gerrit Berkheyden. *Landscape, with a Portrait of a Gentleman holding a Horse*, by Stubbs. *Covent Garden Market*, by B. Nebot (attributed to Pugh in the catalogue of sale), and *A Gondola*, by Fr. Guardi. These will shortly be hung in the Gallery. Of the pictures lent in exchange by the Science and Art Department, the fresco-painting of *The Nativity*, by Pietro Perugino, has been hanging for some time in the Umbrian Room, No. VI.; a head of *St. Dominic*, by Giov. Bellini, is placed on a screen in Room No. VII.; others will be placed in the Gallery shortly.

KIRKSTALL ABBEY.

HAMMER and chisel are busy at Kirkstall Abbey just now, writes a correspondent of the *Manchester Guardian*, busier than they have been, perhaps, since the year 1583, when labourers were employed at sixpence a day to remove fragments of the old monastery for the repair of Leeds Bridge. Were this a "restoration" that the workmen are now engaged upon a good many people would probably unite in regretting that the sixteenth-century vandals had not completed their work. But it is not a restoration; it is a preservation, designed to hand on to the next century the still noble remnants of an edifice which has suffered much decay even within the memory of men of our own time. We of the present generation, however, are not building up this legacy for posterity without a sacrifice. Anyone in whose mind the abbey lives as a lofty though broken pile of picturesque masonry, its irregularities of outline softened and the wide gaps in its grey walls almost hidden by an overgrowth of ivy; who recalls the picture as a combination of harmonious colour, mellowed by time; who remembers that the river which makes the photographs look so effective was latterly the only real blot on the scene—anyone retaining those impressions, if he were to revisit Kirkstall now would receive a sharp shock. The walls are stripped of their evergreen garment, the shattered remnant of the great tower is surrounded by a scaffolding upon which the masons are at work, and here and there at various angles of the ruin the grey monotone of the old stonework is violently broken by huge patches of crude, new masonry. This sounds unpromising, but further investigation will modify the first feeling of alarm, stimulated as that may be at the outset by one very singular addition that has recently been made to the place. Some years ago the land in the neighbourhood of the ruins, together with the abbey itself, was presented to the Corporation of Leeds by Colonel North, and steps were taken to lay the property out as a recreation ground. Strange to say, a portion of the site closely adjoining the monks' infirmary is now being used as a rubbish tip. Approaching the abbey by the high road from Leeds you have the rubbish heap facing you, with perhaps a Corporation dust-cart looming large in the foreground. Poor Kirkstall. It has suffered many vicissitudes and much indignity. Admirers of Turner will remember the graceful print in the "*Liber Studiorum*" of the crypt or abbot's hall. This apartment had the misfortune to retain its roof down to a comparatively recent date. The roof was easy of access and offered a pleasant flat surface above. Here was a combination of advantages too inviting to be resisted. The flat roof became a dancing platform, and was ultimately danced out of existence. But that, speaking in ordinary terms, was a long time ago, and there was no public control over the abbey then. Under the municipal government higher ideals are looked for.

The addition of a public dust-heap to the environment of the abbey is the more inexplicable when we consider the bold yet discriminating policy which is being applied to the preservation of the ruins. Before proceeding to patch the fragments together the Corporation sought counsel from the Society of Antiquaries, and it was on the advice of that body, we understand, that Mr. Micklethwaite, a London architect, and himself a member of the Society, was invited to undertake the duty. Mr. Micklethwaite's policy, judging it by such examples of his work as are already complete, appears to aim simply at the firmer establishment of those portions of the building which still remain above ground. He takes a shaky wall and, without attempting to reconstruct its parts, buttresses it where necessary in such a fashion that future generations will perceive at a glance that this was the original masonry, and that that was a

mere buttress put up at the end of the nineteenth century to keep the wall from falling. In a number of instances, however, it has been found necessary to rebuild. Some of the arches in the nave of the church had lost the support of their original columns, and in order to preserve them the architect was compelled to insert new shafts. His method of maintaining a distinction in such cases between the ancient and the modern workmanship is simple yet effective. The original pillars are round, whereas the new ones are merely blocked into a somewhat similar shape, but left unfinished. The difference, although only a difference in detail, is sufficiently self-explanatory. But Mr. Micklethwaite is not afraid of a startling contrast when he wants to make his meaning clear. For a daring example of his method one may take the treatment of the broken arch at the south-west angle of the transept. Here the architect has raised a new stone pillar which he carries to a great height, almost side by side with the original column, until it meets and supports the over-branching fragment of the arch. Nobody will ever mistake this piece of work, considerable as it is, for anything but a gigantic prop. It is honest but incongruous, and at the sight of it the soul of the Philistine yearns for a compromise. There is perhaps only one notable instance of reconstruction pure and simple. Not long ago one of the minor beauties of the church was the curiously ornate arch at the eastern extremity of the south aisle, peculiar amidst its severe surroundings by the elaborate zigzag decoration of the spandrels. When the Corporation took their present task in hand this part of the aisle had just begun to give way. Pieces of the masonry were found lying on the ground. Fortunately none had been removed or destroyed, and accordingly they were replaced, without addition of any kind except the mortar by which they are held together. There are other examples of this kind of restoration, but none possibly quite so important or so grateful in its results.

Perhaps, however, it is too early yet to pass judgment upon the scheme. The work will not be completed till September. The only thing quite certain about it is that it will preserve for an indefinite stretch of time a relic in which the ecclesiastical architecture of successive periods between the twelfth and the sixteenth centuries is represented, and that in the meanwhile and it may be for a long term of years, the purely pictorial—one might say the externally romantic—aspect of the ruins will be seriously marred. That is the price paid by us for a boon which posterity will enjoy. When, as a preliminary step, the ivy was forcibly divorced from the old stones to which it had clung for many generations, the act seemed almost fatal. But it was not to be avoided. Ivy will disintegrate stone and mortar as surely as it will caress the life out of a tree. One of the missions of the modern archaeologist is to go up and down the country stripping the loveliest bits of ivy from the most appropriate corners of interesting old buildings. At Kirkstall, it seems, we are to have an overgrowth of Virginia creepers to take the place of the banished evergreen. This may do something, for a season at any rate, to curve the sharp angles and soften the crude patches which are now part of the form and colour of the abbey. But we must look for our real consolation, apart from the practical one of the preservation of the ruins, to the new discoveries that have been made by the excavators. It is possible now to trace the whole plan of the great monastic pile which the first abbot began to put together for the Cistercian brotherhood more than seven hundred years ago. The domestic devices and habits of the inmates are recalled to us in curious detail by the circumstantial though silent evidence of the stones. We know that they modified the appearance of the cloister court, still the most beautiful and perhaps the most complete part of the monastery, by erecting a temporary roof on each side of it, so as to provide a sheltered walk in wet weather; and that in the cold season of the year they enhanced the comfort of this resort by screening a portion of it with curtains. We can tell, of course, where they ate their meals and how they cooked them, with what degree of hospitality they received a wayfarer, how they dealt with cases of sickness and what they knew about drainage. The guest-house, unearthed last year on the western side of the abbey, is believed to be almost the only one remaining in England, and it will be guarded as a treasure. Other rediscovered relics are of a more portable character, and it is possible that the most interesting of them may ultimately be arranged under one roof. In the old days—or rather in Kirkstall's later days as a living institution—the builders were apt to dispose of loose material by working it up for any structural alterations or additions that might be in progress. Thus in the chapter-house itself more than one stone coffin may be seen embedded in the walls, where apparently the builder must have placed them just as he would place any other block of stone. Stone coffins were plentiful in those days, and at Kirkstall they are not uncommon now. But they are too good to build with. The intention is to provide them with a resting-place in some appropriate corner of the abbey, together with other interesting relics, of which the variety even now ought to be sufficient to draw many pilgrims to the shrine of St. Mary.

THE ROYAL TOMBS IN WESTMINSTER ABBEY.

FOR some time past, writes Mr. William Morris, there have been rumours afloat that it was intended to "restore" the royal tombs in Westminster Abbey. These seem traceable to the fact that the President of the Society of Antiquaries had had his attention called to the alleged bad condition of the monuments. The result of this has been that Mr. J. T. Micklethwaite, whose knowledge both of the past and the present of the Abbey probably surpasses that of any other person now living, was commissioned to report on the state of the royal monuments to the executive committee of the Society of Antiquaries. His report disposes of the alarmist view that there is any serious deterioration going on in these monuments. They have, indeed, suffered from the effects of violence that took place during the civil and ecclesiastical strife of the sixteenth and seventeenth centuries, and they are worn by time and London filth: but the Dean and Chapter cannot justly be blamed for any neglect of them, as they have done what they could to keep them in a condition at once sound and genuine.

It is possible, however, that the rumour above mentioned may lead to a cry for their "restoration," in the technical sense of the word. I ask permission, therefore, to address a word or two to those who are not contented to see these invaluable records of several centuries of our history, these beautiful examples of a past art, left in a sound and genuine condition.

I fear there are those who wish to change the present appearance of these monuments, who believe that it is possible to bring them back to their original splendour. They would, no doubt, replace the vanished mosaic in the twisted columns of the Confessor's shrine, replace the partly-perished marble by brand-new slabs; do the same by the Purbeck marble of Queen Eleanor's tomb, and polish the new work till it shone like glass (for such things have been done elsewhere); make new lions for Edward III.'s feet to rest on; regild Richard II., and rechase the crowned and chained hart and the sunburst, which makes such a beautiful pattern, on his robe; and (why not when once started on such a road?) cover the wooden core of Henry V. with new metal, and make a new head for him at a guess. It is a matter of course that all the architectural details of canopies and subsidiary figures would be done again, in imitation or guesswork of what yet remains. All this could be done by means of the expenditure of money, and it will be done if the "restorers" have their way, for they will not stop short of it. And what would be the result of it? We should have a set of models more or less ingeniously got together, partly by servile and inartistic imitation, partly by guesswork from the originals. Such models might, indeed, be made for exhibition in some popular show, some old Westminster yet to be produced, and might amuse a good many people for a time, and they would be innocent enough if the originals were left in their integrity. But that is not the possible proposition; the "restorers" would try their experiments on the very historical records and works of art themselves; which means, in plain words, that before "restoring" them they would have to destroy them. The record of our remembered history embodied in them would be gone; almost more serious still, the unremembered history, wrought into them by the hands of the craftsmen of bygone times, would be gone also. And to what purpose? To foist a patch of bright, new work, a futile academical study at best, amidst the loveliness of the most beautiful building in Europe.

I cannot and do not believe that the Dean and Chapter would consent to the perpetration of such a monstrosity, but I feel that it is well to be in time in such matters and to protest before any considerable number of persons should get themselves committed to a scheme, the carrying out of which would be nothing short of a national disaster.

Mr. W. H. St. John Hope adds that an excellent object lesson in the "restoration" of a tomb is afforded us in Westminster Abbey itself. In the middle of St. Paul's Chapel there once stood an ancient Purbeck marble tomb with alabaster effigies of Sir Giles Daubeny, K.G., ob. 1508, and his wife. A few years ago, in spite of every protest, this tomb was effectually "restored," at the cost, I believe, of a representative of the Daubeny family, by making an entirely new tomb, enclosed by a metal gate. The old effigies were laid upon the new tomb and the pieces of the old tomb put inside it. So much for the treatment. The effect may best be realised by an inspection of, say, the tomb of Edward III. or that of Queen Eleanor, then of the "restored" Daubeny monument.

Another object lesson may be learned at Worcester, where one unfortunate royal tomb has already been operated on. Here, in the middle of the choir, stands a Purbeck marble tomb of the fifteenth century on which lies the thirteenth-century effigy of King John, also of Purbeck marble. This was "restored" in 1873 or 1874, by Her Majesty's Office of Works, by overlaying the marble effigy from head to foot with gold leaf to imitate gilt-bronze. The mutilated crown upon the

king's head was at the same time covered by a gilt metal circlet.

I was pleased to see, a year or two ago, that the gilding had already been rubbed off in places, thus disclosing the remains of the colour with which the effigy had anciently been decorated.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held in the rooms, 114 West Campbell Street, on Wednesday evening, the 3rd inst., Mr. Alex. N. Paterson in the chair. Mr. Wm. J. Anderson, A.R.I.B.A., read a paper entitled "The Early Development of the Christian Church." The lecture was illustrated by limelight views, and there was a large attendance. Mr. Anderson said at the outset that the history of early church building was a subject of great importance in several aspects. To the ecclesiologist it was of interest as the study of the earliest forms in which the church was worthily realised, and it was his peculiar function to reconstruct its doctrines from its stones. To the architect it was interesting in its evolution or gradual adaptation to its purpose, and as the chief link between Classic and Mediæval art. The former frequently attempted to construct the edifice on a presupposed symbolic basis, rejecting the aid of true archæology, and deriving it from purely spiritual ideas; whilst the architect found its prototype in the forms of surrounding buildings, the customs of the times, and the habits of the race, under its necessity for provision for the wants of a new faith. The safest point of view was to reject symbolism in the plan and fabric of early buildings and regard them purely as developments arising out of practical necessities. The art of planning or disposing buildings had at the time made great progress among the Romans, but one building was still the pattern of another to a greater extent than with moderns. It was rational to look for a model, or models, of the church in the buildings which surrounded its inception. The lecturer proceeded to sketch the relation of the church to society and public life during the early periods of its existence, and suggested the probable adaptation of a house on the Roman plan for the purpose of worship, and indicated the arrangement of the congregation.

At times the waste places and catacombs were perhaps the chief meeting places of the persecuted sect. There the Christians had buried their dead, and had recourse to these hiding-places for secret assembly and communion; probably these catacombs were held in veneration long after the necessity for using them had ended. Considering the other buildings with the forms of which the early Christians must have been familiar, the lecturer dealt with the possible influence of the Roman basilica or law court, and concluded that it was difficult to credit the theory that these buildings were ever used as churches. Certainly this could not have happened till the time of Constantine, under whose reign the Christians emerged into the light of imperial favour. Even then the law courts would be required for business purposes, and the only buildings which became useless were the temples of the gods. It was a mistake to assume that there were no Christian churches previous to the time of Constantine. There were frequent and long periods of toleration during the first three centuries, and there was every reason to believe that churches were built and other buildings employed and adapted previous to the reign of Constantine, even in Rome itself. The lecturer was inclined to think that it was in such temporary abodes a long process of adaptation to the forms of service must have been going on, which ultimately took form in the huge basilican churches erected in Constantine's day. The key to the diversified types of plan, and perhaps in some measure to the general problem, was possibly the persevering continuance through everything of varying heathen superstitions and practices. The arts of the Roman Empire came everywhere under the influence of the capital, yet religion preserved its local colour and form. In order to understand the peculiarities of plan of the early churches it was necessary to have some idea of the customs of their services. The essayist described fully the service, and the relative position of the four orders of catechumens or penitents to those in full communion. A description followed of the normal form of basilica church, after Constantine. At the conclusion of the very interesting lecture Mr. Anderson received a hearty vote of thanks.

TESSERÆ.

The Nude in Art.

IT will appear, on profound consideration of the subject, that the naked figure in statuary should only be introduced where it is necessary, either in consequence of the nature of the story told, or in order to produce the expression of something higher and more spiritual than can be otherwise rendered by art. Applying this test it will be found that by much the greater number of such works among the moderns are simply naked

men and women; and although often very innocently so, still, in the very unnecessary choice of the artist's choice of form in this respect, already below the level of high art. The necessity of a nude figure depends, then, upon the nature of the subject, or the peculiarly ideal meaning and expression which is sought to be conveyed. There are few subjects proper for sculpture in which the nude figure becomes necessary, because it is simply degrading to the dignity of sculpture to employ it in the mere attitudinising of well-drawn figures, as we often see where a sculptor selects a subject as if merely to show what he can do in marble. When the artist has communicated not the least of spiritual or intellectual expression, his work descends to the level of a mere portrait of a naked woman, but certainly in his hands by no means a satisfying subject of contemplation to a tasteful mind. Considered strictly in the essence of its design, the most perfect of all created works is the yet undegraded form of man. And to be the most perfect among the many countless thousands that are so beautiful and so varied, what must its excellence consist in? Not in the mere expression of contenance, though it is this which distinguishes the human being from the many beautiful but irrational creatures which are given him to be his subjects. In more than this. In the perfect and appropriate form and colour of every part of his frame, each portion suitable in itself, strong in sufficiency, graceful in strength; neither brutal nor effeminate, preserving ever that just medium of wholesome moderation in powers and proportions which itself in every part of man's body already represents the character of his reason applied in the government of his soul; in all these things, and such as these, the perfection of the creation is made manifest, and in each individual one of these things, the reasonable nature of man, while it finds its ordinary expression in the living reality, may be, and ought to be, in its highest manifestation by artistic representation. The strength which is sufficient for defence, and energetic enough to protect the just independence of self and of what properly looks there for safety; but that strength reasonably controlled and habitually exerted in peaceful industry, the intellect which is prompt and vigorous to care for, and direct well the things of this world; but that intellect reasonably controlled from the too exclusive enjoyment of its earthly power, and directed at all moments heavenwards by the perpetual consciousness of an existence far higher and supremely clear—such are the characteristics of man, which every part of his corporeal form is (in its healthy and undegraded state) fitted to express. And in woman the complement of this self-sufficing intellectual character and protecting physical power—in woman the finer sensitiveness of a purer moral nature, the softer and more delicate instincts of a tenderer and more devotional spirit, gain expression in that wonderful series of soft and richly-flowing lines which make her perfect figure the very embodiment of the highest grace formed into life. A form which should, by its faultless grace and matchless simplicity of beauty, express in every part that sweet and lofty destiny of woman—the preserver of purity in this world, and the example of devotion towards the next. And this is what art must express for us in the female form, or it had best not meddle with it. Her delicacy must not be intruded on save in the performance of her highest mission; and if her form do not raise up our minds and fill us with a holy purity of soul, then it fails of its first object, and it becomes degraded, and may well be removed from before our eyes.

Greek Pottery.

The Greeks and Romans employed two distinct materials in their pottery, one of which yielded a coarse, almost granular, not very homogeneous or uniformly coloured and very porous mass; and the other, which yielded a body beautifully homogeneous, a porcelain-like grain and very dense. The amphoræ, cinereal and lachrymal urns, in which the ashes were placed in the tombs, were made of the first-mentioned substance. The amphoræ were often of gigantic size, sometimes from 8 feet to 10 feet in height and 3 feet in diameter. The celebrated tub of Diogenes was an amphora of this kind. In Spain enormous jars, called tinajas, are made for holding wine, oil, flour, &c.; two localities are especially celebrated for these articles, Castello de los Jarrès and Colmenar de Oreja, not far from the celebrated royal residence of Aranjuez, where jars 13 feet high and 7½ feet in diameter are made. Similar vessels are also used in the South of France and in Italy, and, indeed, in all the Mediterranean countries, though, perhaps, not of such a remarkable size as the Spanish ones. The statues and finer vases and tazzas of antiquity were frequently coloured in the clay, some black, some brownish-red, and others of a beautiful sealing-wax red, hence named *terra sigillata*. In addition to this colour of the body the surface was also usually coloured; the statues, architectural ornaments and tombs, being often green or blue, and the vases or tazzas being sometimes ornamented with black silhouette-like figures on the red body, these being considered the most ancient; while those with the figures in red, buff and white on a black ground belong to the highest period of Greek art. Three different classes may be noticed,

those with black figures on a red ground; those with brownish-red figures on a black ground; and yellowish-white or buff-coloured figures on a black ground. The body in all cases is red, in imitation of *terra sigillata*, the black figures being made in a sort of clay pigment, worked up with quick-drying oils, and subjected to a considerable temperature, the black colour being thus produced by charcoal. Many of the old vases were also covered with an exceedingly thin glaze or glass, consisting of silica, iron and soda, which must have been very pretty. This glaze has been found to consist of a combination of silica and soda, or rather of clay, with that substance, being, in fact, a true glass; but it is doubtful whether, like our modern salt-glazed ware, it was formed with salt. This species of glazing appears to have been known at a very early period, for many articles, especially bricks, glazed in this way have been found at Nineveh, some even of various colours; and Herodotus mentions that the walls of the palaces of Ecbatana, in the empire of the Medes, were painted of seven colours, meaning, in all probability, walls built of these coloured and glazed bricks. The Greeks and Romans do not appear, as far as is known, to have used glazed pottery (although well acquainted with it) to the same extent as the Eastern nations; they did not, consequently, make any improvements, at least none which have reached us.

Italian Marbles.

The Italians have a complete marble nomenclature, and many of these names are well known in other countries. Among the most celebrated are the ancient marbles so admired in antique vases, mosaics, &c., such as the *nero antico* or black antique, which is a beautiful intense black marble; the *rosso antico* or red antique, which is a deep blood-red marble, sprinkled with minute white dots; the *giallo antico* or yellow antique marble has a deep yellow colour with black rings, and sometimes rings of another shade of yellow; and the *verde antico* or green antique, which is of a clouded green colour, consisting of a mixture of a mineral called serpentine and limestone. The oriental *verde antico* was not marble, but a porphyry. The precise localities from which these marbles were obtained is not now known, the quarries being in all probability concealed by rubbish, but they appear to have been found in abundance in Greece and Asia Minor as well as in Italy. Many modern marbles resemble them so completely that they may be considered identical; for example, the *verde antico*, or *verde antique*, as it is called by the French, is found at Genoa and in Tuscany, and is one of the most prized marbles of Italy. There is a variety of it termed *polzivera di Genoa* and *vert d'Egypte* by the French. At Bergamo is found a beautiful black marble called *paragone*, which is scarcely inferior to the *nero antico*. Among the other celebrated Italian marbles we may mention the *panno di morte*, or death-shroud, which is a black marble with a few white shells scattered through it; the *brocatello di Siena*, or brocade of Siena, which has a yellow ground, with irregular veinings of bluish red or purple. The *porior* is a beautiful marble from the Porto Venese, hence the name, which was so much employed in the decoration of the palace of Versailles under Louis XIV. The ground is of a beautiful black with veinings of yellow, which have a charming effect. The *mandolato* is a light red marble, with yellowish white spots like almonds, whence the name from the Italian *mandola*, an almond; it comes from Lugezzana. At Verona are found some beautiful marbles—one, a red inclining to yellow, and another with a paste composed of stripes of red and green, with large, pure, white foliated spots. One of the most remarkable marbles is the *lumachelle*, or fire marble, which is a dark brown shell marble, having a curious effect upon light, emitting a number of *chatoyant* or fire-like reflections.

John F. Böttger.

Before the process of making the artificial Sèvres china was brought to any degree of perfection, and long indeed before the factory where it was first made was transferred to Sèvres, the secret of making true Oriental porcelain was discovered. The inventor was John Frederick Böttcher or Böttger, whose father, having initiated him into the mysteries of alchemy, believed that he could make gold. During his stay at Zorn, near Berlin, where he was engaged in learning the profession of an apothecary, he acquired a sort of consideration in the eyes of Frederic William I., King of Prussia, in consequence of his belief that he could really make gold; but fearing that this consideration would lead the king to extort his secret, he fled into Saxony, where he travelled about for nearly three years, during which time he was pursued by agents of the King of Prussia, who finally arrested him. Owing to the interference of Frederic Augustus, Elector of Saxony and King of Poland, he was liberated, but only in name, for the latter wished to have the secret himself, and accordingly placed him under surveillance at Dresden, directing him to work at his gold-making in the laboratory of one Ehrenfried Walther von Tschirnhaus, who had made several attempts at imitating Oriental porcelain by the same means which, in the hands of Réaumur, eventuated

in the production of the celebrated *pâte tendre* of Sèvres. It is unnecessary to say that he did not make the gold; but a red clay furnished by Tschirnhaus, from near Meissen, for the manufacture of his crucibles led him on the way of discovering porcelain. With this clay, in fact, he produced a sort of ware which, although not translucent, as real porcelain would be, was nevertheless of remarkable quality. In order to satisfy the Elector for his failure in gold-making, he communicated to him his hopes of discovering porcelain, and the prince, in order not to excite public curiosity by Böttger's researches, gave the latter a laboratory and workmen in the palace of Meissen. Here he was treated with great consideration, being even provided with a carriage to go to Dresden when he pleased, but always accompanied by an officer. In 1706 Charles XII. of Sweden entered Saxony, and the Elector, fearing that Böttger would escape with his secrets, had him conveyed with Tschirnhaus and three of his workmen to the fortress of Königstein, where a laboratory was fitted up for him. He remained there a year; although well treated, he did not admire his captivity, and he and his companions planned an escape. In 1707 he was brought back to Dresden, where he continued his researches to find a porcelain like that of China. At that period hair-powder was largely employed all over Europe. This powder, as is well known, was made of starch, but an iron-master of the name of Schnorr, travelling on horseback near Aue, in the Erzgebirge, found that the feet of his horse sunk in a clay of a beautiful white colour, and it struck him that it would afford a cheap substitute for hair-powder; he accordingly introduced it into commerce. It happened one day, in the height of Böttger's difficulties to find a white clay, that his valet employed Schnorr's earth to powder his wig. Böttger observed it to be particularly heavy, and on inquiring of his valet the cause, learned that it was a white earth. He at once tried it, and to his great joy produced a true, hard porcelain. In 1709 the discovery was made, and a factory was immediately erected at Albrechtsburgh, near Meissen, which was a real fortress, provided with a drawbridge and garrison, into which no strangers were admitted; even the workmen were sworn to retain the secret even to the tomb (*"geheim bis ins Grab"*), words which were inscribed on all the doors of the workshops, and solemnly repeated once every month to the officers. A ludicrous instance of this secrecy occurred even as late as 1812. At the instance of Napoleon, the King of Saxony permitted M. Brongniart, director of the Sèvres porcelain factory, to enter the Meissen works, and to have the processes explained to him by M. Steineau, the director, who was obliged to be first formally dispensed from his oath. M. Brongniart's only travelling companion was not permitted to enter. As happens in all such cases, the secret did get out, and very soon spread into many countries.

The Practice of Sketching.

Originality and skill in inventing or telling a story, and in expressing the passions, depend, like everything else in art, on a painter's powers of observation, and the difference between the greater or lesser painter results very much from this—that he first thinks of his art everywhere and at all times, the last in his painting-room only and at set hours. Hogarth, describing his own habits, says, "Be where I would, while my eyes were open I was continually at my studies, and acquiring something useful to my profession;" and Stothard's sketch-books were filled with groups of figures and scenery made without selection, but merely of what chance offered to his notice while travelling; sometimes objects which the window of an inn presented while horses were changing, and sometimes what he saw from the top of a stage-coach. Students should be assured that the practice of redeeming spare moments of time by sketching whatever is thrown in their way is an invaluable one. Those who adopt it will be sure to be rewarded by often finding memoranda so made of far greater interest than they had imagined; and it will correct the habit, always fatal to originality, of going to nature for things only that resemble what they have seen in art. Among the drawings by Raphael collected by Sir Thomas Lawrence were many evidently of what chance presented to him. One in particular was singularly elegant, of three or four young men in the dress of his time sitting at a table, and their attitudes but very slightly varied—an accidental group, in all probability, of his pupils. In the works of Michel Angelo we meet with very many attitudes that bear the stamp of being adopted immediately from nature; and, indeed, most of the noble range of his prophets and sibyls have this look. A subject happily adopted from nature should not deprive the painter of the credit due to invention, for indeed the mere faculty of inventing an incident is far more common than the nice and quick perception of that in nature which is fitted to the purposes of art, and which ordinary observers would pass by, or reject perhaps as trifling or unworthy. Burns turned up a mouse with his plough, and was heard to say by a man who was at work with him, "I'll make that mouse immortal." And he kept his word.

NOTES AND COMMENTS

ENTHUSIASTS for the doctrine of progress very often utilise the statistics of deaths as affording evidence of the superiority of the present age over its predecessors. There can be little doubt that living in society is less dangerous than formerly, but the degree of safety is not so easily ascertained as sanitarians imagine. Scales, as it were, have to be employed which are not graduated with equal accuracy, and in consequence errors are inevitable. The consequences of the fallacy of conclusions drawn from the death-rate have been pointed out by Dr. KELLY, the medical officer of health for West Sussex. For example, the bills of mortality for the City of London from 1593 to 1657 showed, though officers were unable to calculate the death-rate from ignorance of the number of inhabitants, that the death-rate in London was very much higher than the birth-rate. Hence it was commonly said that the death-rate in the seventeenth century was 80 per 1,000, in the eighteenth century 60 per 1,000, and in the nineteenth century 22 per 1,000. But with a death-rate of 80 in 1,000 the country must have been very soon depopulated. Fortunately the death and birth statistics of Tiverton, in Devonshire, from 1560 to 1664 were also preserved, from which it might be assumed that the death-rate in Tiverton was not more than 30 per 1,000, so that they must have had in rural England in those times a very healthy state of things. Again, they had the birth and death statistics for Cranbrook, in Kent, from 1550 to 1649, where the rate of births and deaths was much the same as in the present day. An excessive proportion of young people in a district might lower the death-rate. Suppose a population of 500, with a mean death-rate of 14, is taken, the ordinary number of deaths would be seven; but suppose a large school of 500 boys was added, the additional deaths would probably only be two, so that the annual death-rate for the place would be reduced to nine, a reduction not brought about by the action of any sanitary authorities, but by accidental circumstances of population. Suppose the same parish, instead of a school, had a union workhouse with 500 inmates, the additional deaths would probably be 45 in number, raising the death-rate to 52 per 1,000. The only safe way of comparing death-rates according to population is to take from the Registrar-General's returns the deaths at each age, and compare them with the deaths at each age in the different districts.

WHEN Mr. RUSKIN wrote about the Venetian temple, with its "pillars of variegated stones, jasper and porphyry, and deep green serpentine spotted with flakes of snow, and marbles, that half refuse and half yield to the sunshine, CLEOPATRA-like, their bluest veins to kiss," how commonplace the walls of English buildings appear in contrast! Marble was supposed to be almost unattainable among us, and canons of art were laid down by which architects were enjoined to use it most sparingly in order to suggest its preciousness. The illustrations of some of the works on which Messrs. J. & H. PATTERSON, of Manchester, were employed, suggest what is now available by their enterprise. Without involving architects or their clients in extraordinary expense, they have been able to introduce a variety of marbles, not only in public buildings like the Sheffield Town Hall, but in banks, hotels, churches and private residences. In no other way could so much dignity be imparted to an interior at a moderate outlay of money, and in these days when sanitation is supreme by no other material could so much cleanliness and immunity from noxious germs be ensured. Besides (to take two of the buildings) who can calculate the refining influence which walls of St. Sylvester and columns of brocatella must exercise on the humble customers of the Yorkshire Penny Bank, or what delight the combination of Kerry and Galway marbles with alabaster, rouge fleuri, and rouge griotte may afford the poor but imaginative Irish of Bootle when they look on so much natural colour in their Marsh Lane Church, that is assuming the marble is kept clear from trumpery decoration and paper flowers? We have seen some of the buildings which Messrs. PATTERSON have adorned with their marbles, and can testify to the excellence and refinement of their carven work and the fine taste shown in the selection of marbles in order to produce the most harmonious effects. They have helped to dispel

the absurd notion that in England there is fear of colour, and have demonstrated that our dull stones and bricks may be veiled with the most beautiful of building materials, without committing treason against the goddess of economy who so severely watches our estimates and tenders.

THE annual report of the Chetham Society refers to the publications of 1894-95, viz. Sir STEPHEN GLYNNE'S "Notes on the Churches of Cheshire," edited by Canon ATKINSON, and the "Notebook of the Rev. Thomas Jolly," edited by Colonel FISHWICK. The "Notes on the Churches of Cheshire" are of the same character as those on the Lancashire churches, which form one of the volumes of the Society for 1891-92. They give descriptions of churches made by Sir STEPHEN GLYNNE between 1832 and 1864, and include many details which the hand of the so-called restorer has since destroyed, and which are nowhere else to be found recorded; while the notes of the editor add much of interest, especially a careful description in each case of the communion-plate and bells. The "Notebook of the Rev. Thomas Jolly, 1671-93," forms, as the editor states in his preface, "an interesting addition to the diaries of ADAM MARTINDALE and HENRY NEWCOME, and not only illustrates a period of our local history concerning which materials are by no means plentiful," but it also illustrates in a remarkable degree the least favourable side of Puritanism. The editor has prefixed a history of the JOLLY family, which, as well as the volume generally, contains much matter of interest to Lancashire genealogists. The printing of the third part of "Byrom's Poems," edited by Dr. WARD, is completed, and that of the fourth part, concluding the poems, and containing extracts from the commonplace book, is well advanced. Both parts will be issued in the course of the next few months. A full index to the four parts is being made by Mr. FRANCIS M. JACKSON. A competent editor has been found for the "Visitationes exemptæ jurisdictionis Abbatis et Conventus Beate Mariæ Virginis de Whalley," in Miss ALICE M. COOKE, M.A., late Jones Fellow of the Owens College and now Assistant Lecturer in History there. Some years since the President mentioned at the annual meeting of the Society the "Account-book of Sir Nicholas Shireburn," the last of that family who owned and occupied Stonyhurst, as being in the possession of Mr. WELD-BLUNDELL, of Lulworth, the present representative of the Shireburns. Since that time three other volumes of the "Account-books" have been discovered at Stonyhurst. The Rev. JOHN GERARD, S.J., the author of the "History of Stonyhurst," published last year, has undertaken to edit a selection from them, which cannot fail to prove of much interest, relating as they do to a period when Lancashire probably possessed a greater number of Roman Catholic gentry than any other county. These "Account-books" deal with the earlier years of the eighteenth century. The following works are also in progress:—"The Minutes of the Bury and Bolton Presbyterian Classes," by W. A. SHAW, M.A.; "The Life of Humphrey Chetham," by Mr. C. W. SUTTON; "The Lancashire Recusants of 1716: Being a True List of the Names of those convicted as Popish Recusants at the several Quarter Sessions within the County Palatine of Lancaster," by Mr. JOSEPH GILLOW; "History of the Chapelry of Newton," by Rev. ERNEST F. LETTS, M.A.; "History of the Chapelry of Stretford," by Mr. H. T. CROFTON.

THE pocket-books of formulæ and memoranda introduced by Messrs. SPON have made many professional men the debtors of the publishers, for they are the most serviceable epitomes of experience in existence. The latest addition is one on "Calculations in Stresses, &c.," by Mr. E. MONSON GEORGE. As a rule, treatises on the subject have to be printed on paper of a large size, especially if graphic methods are expounded. In this case the pages are only of the "Molesworth" dimensions, but by means of precise diagrams and compressed instructions the process of ascertaining the dimensions of the types of girders in general use is amply explained. It is not always possible to work out moments or arrange diagrams at will, and most books relating to them are not portable. Mr. MONSON GEORGE's pages will afford hints in such cases, and a copy will add little to the weight of "Molesworth" or "Hurst." It is a veritable *multum in parvo*, and wherever girders are designed it should be seen.

THE BILL-ROOM, HOME AND COLONIAL OFFICES, WHITEHALL.

SECONDARY SCHOOLS AND TECHNICAL INSTITUTE, RICHMOND,
OR THE SURREY COUNTY COUNCIL.

WE illustrate the selected design submitted under motto "Labor et Spes," by Messrs. FRYER & BATH, architects, Westminster and Richmond. Eleven sets of plans were sent in and adjudicated upon by the county surveyor. The selected plan was unanimously adopted by the Surrey County Council and the Richmond Technical Instruction Committee. The buildings will occupy a prominent site on the Kew Road at the corner of Selwyn Avenue. The plan provides for a large hall at the corner of Selwyn Avenue capable of accommodating 300 persons, behind which will be a classroom for dress-cutting, and provision for cookery classes, with a separate entrance for the women attending the classes; while a large corridor will separate this building from the hall, and so prevent any annoyance or disturbance to classes in the hall. This wing of the building, however, will not be erected at present, owing to lack of funds. The opposite wing will contain a classroom 60 feet by 25 feet, which will at present be used as a hall, and is divisible into three smaller rooms by means of movable partitions. In the main building on the ground floor there will be two large classrooms, several smaller rooms, and accommodation for the head master. Behind the large classroom will be a well-equipped chemical laboratory and balance-room. On the first floor is the art school, 40 feet by 25 feet, with an art classroom adjoining and an art master's room attached. On the same floor are other classrooms and the caretaker's apartments. There are large basements which will also be utilised. The building will be heated by hot-water radiators and boiler-room; ventilation will be specially provided for; and one of the best features in the plan is the admirable arrangement for lighting, especially in the art rooms, where there are both windows and skylights.

Tenders have been invited for the erection of the buildings, the lowest being that of Mr. T. W. BROOKING, of Richmond, for 6,868*l.*, which, with certain modifications, has been accepted by the Surrey County Council.

TRUMPINGTON ROAD BOARD SCHOOL.

THIS school, standing in the Wanstead School Board district, and providing accommodation for 1,200 children, was opened on February 9, 1894. The building is planned with a large central hall on each floor, from which all the schoolrooms and classrooms open. The staircases are placed on each side of the mezzanines containing the lavatories and teachers' rooms, and are so arranged that both flights are available from either of the upper floors in case of need. The teachers' rooms, which are of exceptional size (26 feet by 16 feet 6 inches), have on each floor bay windows overlooking the halls of their respective departments, as well as bay windows commanding the playgrounds. Externally the school has a plinth of red Stafford bricks up to the ground-floor cill level, and above this the facings are of picked stocks with red brick bands, dressings and moulded courses. Portland stone is used for the doorways and copings. Internally the building on each floor is faced with a brown salt-glazed brick dado, 4 feet 6 inches high, and above this with white Suffolk bricks. The staircases, 4 feet 6 inches wide, are of patent Victoria stone.

The builders were Messrs. A. REED & SON, of Burford Road, Stratford, E., and the total cost of the buildings, including the installation of a heating apparatus, was 13,309*l.* The heating was carried out by Messrs. C. P. KINNELL & Co., of 65 and 65A Southwark Street, S.E. Mr. JOHN T. BRESSEY is the architect.

The Visitors to most of the museums and galleries in London on Monday were fewer in numbers than on Whit-Monday in 1894. At the British Museum there were 2,593 against 3,522; at the National Gallery 5,500 against 7,082; at South Kensington 11,751 against 14,293.

HISTORY OF SILK PATTERN DESIGNING.*

I HOPE it will not be considered too great a divergence from my subject if I attempt a very brief outline of the history of silk pattern designing. It is not necessary to be more than brief, because Mr. Paul Schulze, in this room in April last year but one, treated this subject very learnedly, and his largely-illustrated paper was published in the "Journal" (vol. xli. p. 534). He commenced by telling us of Egyptian ornament of several ancient dynasties, and of Assyria; then of Greece, in which animals formed the most prominent features, and of Roman-patterned textiles. That time was followed by the interesting patterning of the ancient Egyptian Christians, found by Mr. Flinders Petrie upon the clothing of the dead in the Coptic tombs of Upper Egypt, on which garments, men, women and the lower animals and symbols were represented in storeyed sequence so far back as the third and several later centuries. Persian silk weaving at this time was in the ascendant—that is, in the sixth century of our present era. Here is an example which is a reproduction of a reliquary cover from the church of St. Servatius of Maestricht. It is a piece of Persian figure-weaving of the sixth century, made under the government of the reigning family of the Sassanide kings. Its meaning is a hunting-scene, in which two Persian kings on horseback, hunting lions, take part. Between the circles are woven the Tree of Life, the Hom of the ancient Assyrians. This will serve as a type of Persian textile patterning, and to fitly exemplify this rapid sketch of the evolution of textile ornamentation, and to show that the chief thought in the minds of those who made the patterns was the expression of some motive and of some meaning. From this period patterning merged into the Byzantine treatment of ornament, which influenced this branch of art from the sixth to the thirteenth century. The use of the lion was prevalent in allusion to the royal lion of the tribe of Judah representing our Saviour, and of other meanings.

Here is a Byzantine illustration of another kind. It is a *facsimile* reproduction of the patterning of the garment in which the German emperor Otho the Great was buried in A.D. 973. I possess a small portion of the original stuff, which is of silk. The period of the decline and decay of Byzantine art brings us to the art of the Mohammedans and to their power of conquest, which made them masters of Byzantium (now Constantinople), and with it Turkey, in 1453. The Saracens, an Arab race, the first disciples of Mohammed, became masters of Spain in 711 and Sicily in 832, where they established their Saracenic arts, notably those of silk weaving and dyeing. The Normans conquered Sicily after this period, and in the twelfth century Roger II. gave encouragement to the cultivation of silkworms and to silk weaving. He established at Palermo a royal silk factory called Hôtel de Tiraz, a portion of the royal palace of the Saracens of the ninth and tenth centuries. Roger employed both Saracenic and Greek weavers, and the evolution of designing received a great impetus; it is represented by the symbolic animals and drawings shown in the lithographs on the wall, from valuable old textiles now preserved in churches and museums. It was at this period that symbolic designing reached its highest development. For example, this drawing of a lion seizing a duck, representing government, and pursued by an eagle, meaning good luck and riches. The lion and hoopoe signify wisdom. Here is one of two stags kneeling under the sun's disc, from which radiate sunbeams yielding dewdrops. This refers to the verse in the psalm, "As the hart pants for cooling streams, so longs my soul for Thee, O God."

From Sicily the art travelled to Lucca, Milan, Florence, Bologna, Venice and Genoa, and up to the dawn of the fourteenth century the designs were but modifications of Saracenic creative talent, but yet always having meaning.

Here is a reproduction of one, probably from Lucca looms. It possesses great beauty, both in motive and in drawing. Mr. Schulze thus describes it:—"The dog, the symbol of the human soul, has been freed from this mortal life, as indicated by the broken chain; the eagle, the symbol of divinity, having descended from heaven to break the chain, now steers the soul to the abode of the blessed, and this action takes place under the shade of the great and mighty tree of the Church. This design was probably made for funerals."

From this time, or during the whole of the fourteenth century, came gradually in the splendid pattern designing of the Italian Renaissance, the close of which may be considered contemporaneous with Raphael and Michel Angelo, or (say) of the middle of the sixteenth century. There are some patterns from Crivelli's pictures in the National Gallery, copied by Mr. Sidney Vacher. They have such a family resemblance to each other as to point very distinctly to Crivelli's skill as a pattern

* From a paper "On the Improvements in the Designing, Colouring and Manufacture of British Silks since the Egeiton Exhibition of 1890," read by Mr. Thomas Wardle before the Applied Art Section of the Society of Arts.

designer. The influence continued onwards to the time of Paolo Veronese, or nearly to the end of the century.

The liking for the representations of animals in woven fabrics had, during this time, gradually given way to very conventional treatment of foliage, fruit and flowers, in formal diaper work, with much Gothic influence. It was never naturalistic. By the end of the fourteenth century animal representations had disappeared, the pomegranate, the symbol of Christian love, and the pineapple having gradually supplanted them. These fruits became through the fifteenth century the characteristic features in the ornamentation of the silken stuffs for both official and domestic dress, and for the ornamentation of churches and houses.

A very interesting development of the pomegranate pattern appears about the end of the fifteenth century. Broad, ornamented stems take an undulating upward course, and on either side branches bearing roses, blossoms, leaves and little pomegranates and crowns are disposed. They were the fashion of the Burgundian court in the latter part of the fifteenth century, where the use of an immense mass of material made the employment of these gigantic patterns possible.

The sixteenth century saw a great change in pattern designing. The previous evolution having been first of a religious expression, which became more decidedly Christian in meaning, was now succeeded by patterns of a more secular kind, and frequently they possess little or no meaning. This I incline to think was owing to the spread of the silk industry into France and Flanders, and away from the immediate art and religious influences of Italy. The vase took its place in the pomegranate pattern; then, owing to the cut-up forms of dress consequent in changes of fashion, the large designs disappeared, and smaller floral ones, still conventional and fragmentary, took their place.

The Reformation in the early part of the sixteenth century also influenced pattern designing, and especially colouring, to more subdued and less ornate effects. Probably the old designs having so much religious meaning were unhappily discontinued because of their association with the excesses of dogma and ceremonial of the papacy, and pattern designing lost all its dignity and much of its art perception. The designs obtained and deserved the epithets "baroque" and "rococo," and gradually became distinguished for a superfluity of confused and discordant detail, as may be seen in some of these fabrics of Louis XV. (1715-74).

For the first time realism in the drawing of floral subjects crept gradually in; it has influenced French designing down to the present day for the worse, and has now become the rule, and not, as in the early part of the seventeenth century, the exception.

Since the days of the Renaissance in Italy and Spain there has been only one great influence in fabric pattern designing, that of the French, and we may begin with it where the Renaissance practically ended, say from about 1600. The dignity of the old patterns gradually fell into more or less meaningless and commonplace treatment. I shall illustrate this by typical examples of old fabrics and drawings.

First, the patterns of the time of Henri IV. (1589-1610), the English equivalent of which is the time of Elizabeth (1588-1603).

There are two patterns of her time on the wall; one is a portion of silk from one of her own dresses, lent to me by Mrs. Lomax of Lichfield, the other a more ceremonial and dignified pattern of a dress which she is wearing at her devotion. It is taken from a frontispiece of a reprint of an ancient prayer-book, and illustrates the laudable fashion of wearing large patterns. It will be noticed that this pattern is so large that in its length it does not repeat what belongs to the patterns of the late Italian Renaissance.

The characteristic treatment of the Henri IV. period for stuffs is shown in the drawing of a beautifully-coloured Lyons velvet of this period. This pattern will evidence the disregard for construction and symmetrical arrangement, and with the others will suffice to show the leading up to the "baroque" character of the rococo period, which culminated in the reign of Louis XV.

Lace manufacture became a very important one in France in the latter half of the seventeenth century, and the silk designers of Lyons were soon influenced to imitate lace effects in their patterns for brocades, so in many of them one is constantly reminded of Argenteuil lace patterning, and of more recent forms. Lace was at this time much used to enrich the ornamentation of gentlemen's coats and vests, and the imitation of it in the loom was one of easy transition, and its influence continued down to the Empire. The culmination of ornamental forms and devices occurred in the reign of Louis XV. Every imaginable idea was brought under requisition and with great skill. Even Chinese ornamentation was largely laid under contribution. Mr. Schulze's words are:—"Flowers and leaves are rendered with the full effect of light and shade, and the natural colours of the flowers are imitated. The rose is used for choice, but fruit also, cherries and plums—in fact, a profuse

flora in all possible fantastic forms, together with parts of architecture, cascades, shells, rocks, &c., served as models for the textile patterns of this time."

In the time of Louis XVI. the drawing became still more fanciful and naturalistic, the patterns smaller and accompanied by striped grounds, plain and coloured. Again, in Mr. Schulze's words:—"These small patterns are intermingled with a variety of hunting, fishing, music, and such like symbols; fluttering ribbons, festoons, fruit baskets, &c., appear in the intervening spaces. They are the reflection of a period when ruin was approaching, and when no energetic effort was possible. The designs on the textiles are a faithful mirror of the trivial social life of that time." But this state of things did not last for long. Probably in consequence of the excavations at Herculaneum and Pompeii motives were furnished for woven designs, which were taken from the wall-paintings of classic antiquity. They bring us, after the desolation which the French Revolution in 1789 spread over art, science, industry and trade, to the style of the first French Empire, which found its opportunity in the imitation of the antique, or in a new but weaker renaissance.

Since these periods the art of textile designing in France has been a play upon them, and in many cases a direct imitation of them. I fear it cannot be said that any healthy influence or originality has resulted during the last seventy years of French designing. In my opinion it has gradually retrograded until, as a rule, it has become burdened with the merest trivialities, commonplace treatments, and eccentricities of form. Large and dignified patterns have, unfortunately, given way to small ones, for the most part in every conceivable state of art degradation.

In colour the French are always clever, and it must be conceded that, as a nation, they possess great taste in that respect. They make poor designs look attractive.

The more classical forms of decoration of the Empire period are not yet without their baneful influences and admirers, although the taste for the styles of Louis XV. and the Empire is visibly declining in England, under the healthier influences of Anglican effort and the cultivation of a more imaginative or ideal style of patterning, in lieu of the worn-to-death posy-groups of pretty flowers, which are often below the drawing capabilities of a schoolgirl.

It can now no longer be said that we in England are deficient in designing power. Whilst decorative design has degenerated abroad it has, through the advantages offered by South Kensington, and from other indigenous influences in all parts of the country, greatly developed, so much so that our designers have now attained a high degree of excellence, and are sought for from outside the country.

The reasons which actuated me in selecting a date no further back than 1890 from which to review improvements were that it was the year when several of us felt that it was time public attention was called to the fact that the silk industry of this country was fast losing ground, and was threatened with extinction, and that the late Lady Egerton of Tatton, whose interest in the industry chiefly arose from her home being so near Macclesfield, also thought that, before any serious attempt was made by English ladies to advocate the wearing and other uses of British silks, it would be well to have an exhibition of the denominations of silk in which our manufacturers excelled, and that the exhibition would also be very useful as recording the then state of styles and colourings of home-manufactured silks.

That exhibition took place, and in spite of a number of silks of excellence, there was a consensus of opinion that in many respects, especially in dress silks, the exhibition was not a success, and that ladies could only accord a preference to British silks in proportion to such an advancement of art, both in design and in colouring, as should show real progress in the immediate future.

In season and out of season since then the necessity for artistic progress has been preached to manufacturers, and the result has certainly been surprising. There has been an increase of able designers, and a careful study of the history and evolution of patterned textiles on all sides. The schools of art have become more in touch with the silk industries in which they are placed, and, as this collection illustrates, British and Irish manufacturers are no longer nervous or ashamed of proclaiming to the world that their products are worthy the attention of the wearers and users of silk, and especially of those of them who are known to possess the highest culture and taste.

Most fortunately for the industry, that wealthy and powerful body of gentlemen who constitute the channels of distribution have, for the most part, given in their patriotic adhesion to the movement for the restoration of British silks to their old places of pride, and are satisfied that there is inherent capacity in our manufacturers to satisfy in the near future, if not entirely at the present moment, their requirements; and they are, I know, zealously helping forward the movement with much determination and at some temporary sacrifice.

The collection now before you can speak in more eloquent

language than mine, and I desire to say but little about it this afternoon in order that more time may be given for a thorough inspection of the silks now exhibited. It is an object-lesson which will be best taught by self-description. What is, I think, worthy of observation, is a lessening dependence upon continental styles and patterns, and the more English and less French treatment of both patterning and colouring.

The existence of an English school of colouring, which is represented by the leading painters of our time, does not render it necessary for any students to go abroad for inspirations in that respect; and I think the refined and harmonious colourings which characterise the silks in this collection will convince every one here that the exercise of a purer and higher taste is conspicuously greater to-day than at the exhibition of 1890.

There is also now a happy union of thought and effort between distributor and manufacturer. There are gentlemen of unquestionable taste and artistic perception amongst the distributors who know but little of the technicalities of manufacture, just as there are manufacturers of the greatest possible technical skill who are not equally alive to the artistic progress of the times and to the taste and requirements of the distributor, and so when both combine to produce a desired effect, the result is much more satisfactory.

Sir George Birdwood said he entirely concurred in Mr. Wardle's condemnation of the influence of Japanese art on English decorative designs. He was aware of being deeply prejudiced against the conventional applied art of Japan, but he spoke now not from his prejudice but from the facts of history. The vogue of Japanese art in France during the reign of Louis XIV. developed the rococo style of art which prevailed throughout Europe during the reign of Louis XV.; and the revived influence of Japanese art in Europe since the publication, in 1863, of Sir Rutherford Alcock's "Japan," is the obvious cause of the degradation, and he would say depravity, of taste which has obtruded itself in so many departments of English artistic activity in recent years, and which, it would be as well to emphasise, in connection with Mr. Wardle's paper, was particularly apparent and repellent in the aggravated absurdities of the female fashions of the day.

THE NIGG CROSS SLAB.

A FITTING companion to the Ruthwell Cross from Dumfriesshire in the Edinburgh Museum of Science and Art has now been found in the Ross-shire Cross Slab from Nigg. These stones, says the *Scotsman*, not only represent two entirely different styles of art, but they are memorials of two important religious bodies, who, each in their own way, did much for the making of England, and who met and parted at a great crisis in its history. It was between the Celtic and the Anglo-Roman Churches that the first great religious controversy in this country took place. The Ruthwell Cross is an Anglo-Roman monument. It represents the Anglian party who adhered to Rome. The Nigg Slab, on the other hand, shows us the art of the Nonconformist Celtic missionaries who "went out" from Northumbria 1200 years ago and carried with them to Scotland, or rather to the Highlands of Scotland, the first seeds of ecclesiastical controversy.

In November of last year, Sir R. Murdoch Smith, having made the necessary arrangements with the Rev. Mr. Fraser, minister of the parish, *formatori* were sent from the Edinburgh Museum to mould the Celtic cross slab, which now stands in the churchyard at Nigg. The weather, fortunately, was favourable; the mould was successfully made, and three casts were taken from it—one to Edinburgh, the others for South Kensington and Dublin. The cast now set up in the Museum, Edinburgh, reproduces exactly the weathered carvings and sculpture, and has been coloured in close imitation of the old red sandstone of the original. The Nigg Cross Slab, the most perfect both in design and preservation of the Ross-shire monuments, is probably also the finest of the 300 or thereby Celtic stones which are known still to exist. Unlike the inscribed Ruthwell Cross, the Nigg Slab bears no word or letter to tell its purpose or to suggest its age. There has, however, gathered round it a tradition which it shares with two other neighbouring monuments. These are known as the Shandwick Stone and the Hilton Stone, and were, says the tale, erected as memorials of three sons of a Danish king who were found drowned on the shore near by. The tradition, as Hugh Miller has preserved it in his "Scenes and Legends of the North," tells that a Maormer of Ross married a daughter of the Danish king, but, proving an unkind husband, the lady contrived to escape to her father, who fitted out a fleet and army and set sail to avenge on the Maormer the cruelties inflicted on his daughter. The king took his three sons with him, but on nearing the Scottish coast a terrible storm arose in which most of the ships were wrecked and the three princes were drowned. The ledge of rock on which this disaster is said to have taken place still bears the name of the king's

sons; a magnificent cave which opens among the cliffs on the adjoining shore is still known as the King's Cave, and a path that winds to the summit of the precipice beside it as the King's Path. The bodies of the princes, says the tradition, were buried, one at Shandwick, one at Hilton and one at Nigg, and the sculptured slabs at these places are said to have been erected to their memory by their father. Whatever may be the event that these stones commemorate, the character of the ornament on the Nigg Cross slab fixes its date at not later than the ninth, or possibly the eighth century, A.D. It would thus be nearly contemporaneous with the Ruthwell Cross, and a comparison of these monuments in the museum brings out more clearly the characteristics of each. The Nigg stone, from Ross-shire, may be taken as representative of the art of that portion of the Celtic area which lies along the eastern coast of Scotland north of the Firth of Forth—the spot of earth on which alone such remains of purely Celtic art are to be found. It is a Christian monument raised among the Celtic community, a community, however, which differed so strongly from the churchmen of Northumbria that each party looked on the other as rank schismatics.

The Ruthwell Cross, on the other hand, is a monument of the Anglian Church. It comes from the time when the North Humberland extended to the Firth of Forth, and Eadwine's-burh was Northumbria's northern outpost. There is nothing Celtic about the Ruthwell Cross. Its ornament of foliaceous scrolls, intertwined with birds and beasts, its Latin inscriptions cut in Roman letters, its figure sculpture, all suggest that the forms and traditions of work were borrowed from Gaul or the farther south. But it is not in these that the main interest of the monument lies. These were the common property of Christendom, and as old as Christianity itself. The interest and importance of the monument is rather to be found in the fact that side by side with these old-world things of Rome there is inscribed upon the stone a new song of the Cross, an Anglian "Vision of the Holy Rood," written in the northern measure of a Viking's chant and cut in the letters of a language that Rome never knew. The English art, the English religion are thus, so to speak, grafted on the Roman stem; and though this connection may appear somewhat fanciful, it gains significance from the history of the time when the monument was raised. The date must be shortly after the memorable Synod of Whitby, A.D. 664, when Northumbria severed its connection with the Celtic missionary church, which till then had been the only church of the North. King Oswin's decision was of vital importance to the future England. The choice lay between an adherence to the Irish Celtic Church and a connection with Rome. The Celtic Church had for a long time been cut off from the rest of Christendom, an isolated body differing on points of government from the church of the Continent. If Northumbria adhered to it, she must have shared its isolation, and have cut herself off, not only from Rome, but also from spiritual communion with the rest of England. But Rome, though fallen from its former greatness, still possessed the traditions of civilisation, of literature, of law and of art. "To fight against Rome," said one of the leaders of the time, "is to fight against the world;" and Northumbria, by adopting the communion which had been maintained unbroken at Canterbury since the days of Augustine, not only united the whole of Christian England, from the Channel to the Firth of Forth, in obedience to Rome, but took the first great step towards that union of England and Englishmen under one king which was completed two centuries later.

The defeated Celtic Church, thus dismissed and supplanted, shook the dust of Northumbria from off their feet, and, led by Bishop Colman, departed to Hii, the modern Iona. Even there it is not certain that they had rest. The Roman influence followed them. In discussions on the rival doctrines and forms of worship the Roman party were again victorious. The Roman ritual was adopted, and, following in its wake, the Romanesque influence appears in the art of the sculptured stones of the West Highlands. It is probable that only on the eastern half of Scotland the missionary Celts at last found rest. There they worked and preached and civilised as they or their fathers had done before in Northumbria, and left behind them those monuments of pure Celtic art of which the Nigg Cross is a typical example.

The slab now measures 7 feet 4 inches high by 3 feet 5 inches broad, and is rather more than 5 inches thick. The sides are nearly parallel for a height of 6 feet; they then slope inwards to form a gable-shaped top, in which the principal figure-subject is sculptured. When entire the monument must have measured about 14 inches higher than at present, but it was thrown down during a gale in 1787, and broken in two pieces. When seen by Mr. C. C. Petley, who visited Nigg in 1811, the one portion was lying in the churchyard, and the other had been thrown over the churchyard wall. Fortunately Mr. Petley made drawings of the two fragments, and from these drawings it is possible to restore the parts which have been broken off and destroyed since his visit. This priceless monument, which thus so narrowly escaped destruction, has now

fallen upon happier times. Its pieces have been carefully fitted together, and the whole slab has been set on a solid foundation specially built for it adjoining the vestry of the church.

The general plan of the decoration of the slab is similar to that seen on many of the decorated pages of Celtic manuscripts. The surface of the obverse is divided by panels which are so arranged as to form in the centre a cross, the shaft of which extends to the bottom of the slab, the other panels serving as its background. The ornament is entirely different from the Romanesque forms of the Ruthwell cross. Celtic art is, so to speak, a child of the soil. Its elemental forms are so simple that they have been the playthings of every nation in its young days. The early Greek potter had little else than these frets and spirals and twisted bands with which to decorate his vessels. By-and-by he mastered the human form, and these primitive elements had to take a subsidiary place. But to the Celtic artist they are his all in all. It is true he carves many figure-subjects, but these crude productions can never be looked upon as Celtic art. It is by its ornamental forms that it must be judged, and though these are limited for the most part to the fret, the spiral and inter-lacements of varying complexity, an examination of the panels of the Nigg stone will show to what unequalled skill and to what beautiful results the Celtic artist attained. His inter-lacings twine and intertwine with a certainty and unerring accuracy that almost defies imitation; his spirals are bewildering in their complexity, yet as an ornamental pattern are clear and perfect; and even on the fret or key pattern, common to every people from Ross-shire to Peru, he stamps his individuality, and by an original treatment marks it as a Celtic form. As a rule the human figure and animals appear on these monuments only to serve the purpose of filling up spaces, without regard to proportion or artistic composition. On the reverse of the Nigg stone there is a gathering of various sculptured forms which seem to have little connection with each other. The central group, David rending the jaws of the lion, is much damaged, and would be unrecognisable save for the symbols, the harp and the sheep, which remain to tell us that the sweet singer of Israel is here represented. Below and above this group is a stag hunt in much better preservation, and showing a good deal of natural drawing and action. This subject is said to have a symbolical significance, and refers to the chase of the soul until it finds rest in the bosom of the Church. Other forms there are on these monuments which are purely symbolic, but which have defied all attempts to ascertain their meaning, and among such are the so-called elephant symbol on the Nigg slab and on the Shandwick stone, and the spectacle form and the crescent and V-shaped rods on the Hilton monument. The principal figure sculpture on the Nigg slab is scarcely less free from mystery. In the pediment-shaped top of the obverse, two figures in flowing robes, and with hair falling on their shoulders, are represented in high relief, facing each other, and bending forward toward a chalice-like form placed in the centre. Each holds a book in his hand, and seems intent on its open page. Two dogs cower below the figures, crouching low, as if awed by some supernatural power; while in the centre a dove descends, bringing in her bill the sacred wafer to complete the elements of the Eucharist. Over the group are two very conventional trees which form an enclosing border. Various attempts have been made to explain this scene. Hugh Miller suggests, among other explanations which he gives, that it may represent a treaty of peace between two rival chieftains, the book and the sacred elements adding to the sanctity of the transaction. It may be as near the mark to associate the sculpture with the historical events already referred to. The Celtic and Anglian Churches separated on a question of Easter celebration and a dispute as to the form of tonsure proper for the clergy. Here we have the untoured Celt in his northern home celebrating his most sacred rites under his own vine and fig-tree, no man making him afraid. The dogs of passion and of unrest are subdued and harmless, and behold! the worship is accepted, for the dove, the Holy Spirit, descends from on high to assist at the feast and to bless the worshippers. But mere conjecture as to the meaning of such subjects would be endless. The artistic value of Celtic monuments is in their ornament, and the Nigg slab is not only an unrivalled example of Celtic ornamentation, but to the student it is quite an epitome of the characteristic forms of Celtic art.

The Society of Architects are making a somewhat new departure by holding their next ordinary meeting in the field. The reason given, we believe, for this step is, that the summer months are entirely suitable for field excursions, and that members would welcome an opportunity to visit places of architectural and archaeological interest during that season. The forthcoming excursion to the Roman villa at Darenth inaugurates the new movement, and the address to be given by Mr. George Payne, F.S.A., on that occasion should be of great value and interest.

THE ORDNANCE SURVEY.

A REPORT of the progress of the Ordnance Survey to December 31, 1894, has just been issued as a Blue-book. It states that all cultivated districts in England and Wales, with the exception of Lancashire and Yorkshire, had been surveyed and published before March 31, 1890, on the 1-2500 scale. With regard to the resurvey of Lancashire and Yorkshire on the 1-2500 scale, all the cultivated districts, 7,293 square miles, have been surveyed. The area has all been published except 15 square miles. During the year 1,086 square miles were published. The Treasury in December 1886 sanctioned the general principle of the revision of the Ordnance maps; but, owing to the necessity of resurveying those counties of England and Scotland which had been originally surveyed on the 6-inch scale, it has only been possible to begin in 1894 the actual revision of the 1-2500 plans. All England and Wales has been published on the 6-inch scale. The uncultivated districts in Lancashire and Yorkshire, 861 square miles, have been revised on the ground. The publication of the revised 6-inch plans of Lancashire and Yorkshire is in progress. The area published is 4,891 square miles, of which 2,009 square miles were published during the year. The new series 1-inch map, based upon the 1-2500 and 6-inch surveys, is published in two forms:—1. Outline and contours. The area published is 54,121 square miles, of which 5,497 square miles were published during the year. Some delay has taken place as to the Welsh sheets, but this will not affect the time for completing the whole map, namely, 1896. 2. Hill features. The area published is 16,459 square miles, of which 1,140 square miles were published during the year. According to existing arrangements, the publication of this map will be completed in 1902.

PRESERVATION OF KARNAK.

THE honorary secretary of the Society for the Preservation of the Monuments of Ancient Egypt, Mr. Poynter, R.A., has written a further appeal for funds to complete the valuable work now being done by his Society at Karnak. Many hundreds of people must have visited the magnificent ruins at this celebrated place during the past winter, and a very moderate subscription from each would provide the small sum required to finish the work actually in hand, which is nothing less than saving the ruins from the destruction which must inevitably ensue if the water which percolates into the Karnak basin during the inundation of the Nile is allowed to stand there for many more years, working its slow but certain mischief. The project for arresting the evil effects of the inundation water is set forth in full in the last annual report of this Society. It consists, in brief, of an engine of sufficient power to pump out the water as fast as it enters the ruins, so that it is never allowed to accumulate—in short, to keep the ruins as far as possible dry—and of a drain to carry the water into the Nile. This scheme has been approved by successive officers of the Irrigation Department in Cairo, and is now in charge of Mr. W. J. Wilson, Inspector-General of Irrigation for Upper Egypt, who has sent a final report and estimate for completing the work; and it has the complete approval of Mr. W. E. Garstin, the distinguished engineer, who succeeded Sir Colin Scott-Moncrieff as Secretary of the Public Works Department.

Mr. Wilson writes from Karnak, under date of May 8:—“An eight horse-power engine and 10-inch centrifugal pump were purchased last year, and are at Karnak. A contract for the construction of the pump-well, engine-house and outfall channel has been made with M. Santamaria, a capable contractor, and the work is in progress.” The cost of the whole as estimated originally by Major R. H. Brown, and confirmed by Mr. Wilson, is 1,300*l*. Towards this amount this Society has already contributed 865*l*.; a further sum, therefore, of about 450*l*. is required. In a note attached to Mr. Wilson's report Mr. Garstin writes:—“If the balance can be at once provided the drain can be completed and in working order before the ensuing flood; if not, another year will have been lost, as once the subsoil water level rises it will be impossible to carry the excavation down to the required depth.”

Mr. Wilson further suggests the construction of some drains round three sides of the ruins, to lower the saturation level of the soil which is accumulated about the walls and columns. Towards the removal of this accumulation of soil and *débris* the Egyptian Government have appropriated for this year 1,000*l*. from the Museum Budget; but this sum will go but a little way towards removing the mounds which have grown among the ruins in the course of centuries, and as Mr. Garstin writes, “It will naturally be necessary to take in hand those portions of the monuments which appear to be in the greatest danger.” The danger arises from the saturation of this accumulated soil, which is impregnated with the salts destructive to the stone. Unless an immense sum of money can be provided at once for the removal of all the saline soil (the most moderate estimate is 30,000*l*.) it can only be done very gradually

as money is provided. Mr. Wilson's plan for checking the destructive effects of the salt in the soil is to make "deep drains, which would nearly surround the Temple of Ammon and would tail into the lake." The soil being in this way dried the salts would cease to have a deleterious action and would check decay until the whole of the soil can be removed. For these drains a further sum of 550*l.* would be necessary.

But for the present the important thing is to finish the channel to carry off the water of percolation as it rises and is pumped out. If this can be done during the ensuing season an immense step will have been taken towards averting a destruction which is now imminent, for the columns of the great hall are becoming every year more insecure, and Mr. Garstin says, "Should any one of these collapse there is strong probability that it would bring down others in its fall."

THE RELATION OF ARCHITECT AND CLIENT.*

VERY few young architects, and not many old ones, have any adequate idea of the immense responsibility that they incur in carrying out their professional work. They hear of the old French architect who, after a life of honourable and successful practice, was deprived of all his property and thrown into prison, because some sketch-plans which he had made at the solicitation of one of his friends were carried out in such a way as to involve the failure of the building erected from them. They read in the newspapers of the St. Louis architect who had to pay 5,000*dols.* damages to the widow of a man killed by a mishap during a building operation, carried on solely by the contractors; or about the Chicago firm of architects who were pursued in the courts for manslaughter because, as was alleged, they were not present to see that the contractor set properly a roof truss in one of their buildings; and yet they go on in the same old way, trusting to luck to prevent anything of the kind from happening to them.

Trusting to luck is not the best way of guarding against accidents, and I propose to point out in a few words how architects may best prepare themselves to meet a liability, the money-value of which has been estimated by the French courts at 1½ per cent. on the cost of the building carried out under the architect's direction, while it is considered here, by those best able to appreciate it, so grave that I have heard a lawyer of experience say that if he were an architect he would never hold any property in his own name, but would put all his savings in the name of his wife or a trustee of some kind, to prevent them from being swept away as the consequence of some oversight or the mistake of a subordinate, or perhaps by the fault of some other person, simply fastened on the architect by the whim of a jury.

The first and always essential condition of the safe practice of our trying and responsible profession is constant care. It is in one way a misfortune for us that we have to be not only engineers and business men, but artists; and the sympathetic, enthusiastic temperament which makes a good artist is rather liable to be led away from the cold consideration of dollars and cents which is essential to the business man; but it is quite possible for the most brilliant artist to guard himself so effectually against being carried off his balance by passing fancies as to become also a model man of business, and the quick sympathy and active imagination belonging to the artistic character may be and should be useful to the architect in applying that best of all rules for determining one's conduct in affairs with other people—a rule which the architect should engrave in large letters on his mind—try to think how you would feel about the matter if you were in the other man's place.

It is safe to say that nine-tenths of the lawsuits in the civil courts arise from failure to apply this maxim in the early stages of the controversy between the parties, and we shall do well to exercise our imaginations in that way on every possible occasion. Let the architect while making his plans frequently put himself mentally in the owner's place. He will find that the little difficulties of arrangement, which as architect he had smoothed over somehow, as being of little moment amid the general merits of the design, will have a very different aspect to him as owner. As architect, for example, he will probably attach very little importance to the location of the bath-room over the front porch, or the introduction of a few extra winders in the back stairs, but as soon as he assumes in imagination the character of the owner, he will see in his mind's eye the group of plumbers, hot-water pails, disconsolate housekeepers and wondering children that will surround the water-pipes in his bath-room every cold morning, or will hear in fancy the crash of the servants landing in a heap at the foot of his insufficiently-studied staircase, and will apply himself in conse-

quence with renewed vigour to the task of rearranging his plans, until they satisfy him as householder as well as architect; and a little later, when he hears of one of his brethren who has been compelled by a court to pay the cost of altering the plumbing in a building, to get it out of reach of frost, or has been sued for damages resulting from a fall down stairs carelessly planned, his conscience will reward him.

Not only in the designing of his buildings, but still more in carrying them out, must he have constantly in mind, not alone the interests, but even the prejudices of the owner. It is common for young architects to imagine that their quality as artists gives them authority to act for their clients in matters of taste; as, for instance, in the selection of decorations, mantels and so on, and they make contracts for such things without their client's knowledge, only to discover, perhaps, that their client repudiates their interference, and that they have made themselves personally liable to the dealers for the amount of the bills. It is true that the owner may expressly authorise the architect to select furnishings and contract for decorations, and if he does so he will be bound to pay for whatever the architect furnishes for him under this authority; but such authorisation should be given in writing, or before witnesses, and the architect is bound strictly by its terms.

To many architects, both young and old, this limitation of their artistic discretion is very annoying. "What," they say, "can the owner do what he chooses with my design, paint the outside in red and green stripes, put a tower on the piazza roof, or paper the front hall with imitation malachite, relieved with dashes of vermillion, and have I, the artist, the responsible author of the design, no right to interfere, or to confer a benefit on him by exercising my superior knowledge on his behalf, without having to ask his leave to do so?" In France or Italy the answer to such a question might be doubtful, for art and artists are both respected there; but in this country the unanimous answer of the courts would be that the owner is sole master of everything relating to the appearance of his building, and that the architect cannot involve his principal in a penny of extra expense for artistic purposes without his special and express authority.

In regard to matters of construction the case is different. Here, in America, the authority of the architect is paramount to that of the owner, and while the owner would have a just cause of complaint against the architect if the carrying out of the latter's plans and specifications involved constructive difficulties, the occurrence of contingencies which could not reasonably have been foreseen by the architect might make it necessary to take special precautions; and, in such a case, if the necessity were urgent and the owner could not well be applied to for special authority, the architect is not only entitled to order the necessary work to be done and to make the owner responsible for payment for it, but is bound to do so, and the owner would have a good claim for damages against him if he stood by and saw the building under his care suffer injury through his neglect to exercise this authority.

Between the responsibilities which he incurs for doing anything and those which fall upon him if he does nothing the architect's professional career looks a good deal like a perpetual voyage between Scylla and Charybdis; but the channel is not so difficult to trace if one keeps in mind the principle of putting one's self, in cases of difficulty, in the place of the owner. Let the architect imagine what he would say if he should order a new suit of clothes and the tailor should send them home with a lace frill around the bottom of the trousers and a substantial addition to the bill on account of this extra Elizabethan ornament, and he can judge of the feelings of the owner who finds that his architect has ordered mantels built for him at a cost far exceeding that of the job lot of ready-made ones which he had just agreed to purchase, or had secured for him a Morris couch for the alcove which he had intended expressly for his grandmother's haircloth sofa; while, in the same way, the sentiments of an owner towards an architect who will take no responsibility in looking out for his pecuniary interests are very similar to those that would be entertained by the architect himself toward a negligent and careless assistant.

To the young and generous practitioner there is something revolting in the idea that it is necessary to guard himself against his clients, and he would generally much prefer to wear, as it were, his professional heart upon his sleeve, throwing himself with enthusiasm into what he imagines to be his employer's wishes with regard to his new building, and sacrificing, with conspicuous recklessness, his time and trouble to that end. So far as earnestness for the owner's interest is concerned, this is all very well, for zeal must, in young architects, make up for their want of experience; but it is the zeal tempered with discretion that will be of most benefit to his patron, and discretion will soon teach him that his patron's interest, as well as his own, is best served by his own steady maintenance of his professional position. If he shows an incautious ardour in seconding the owner's wishes in regard to the building, without keeping strictly within the limitations of the contract, he is likely to find that he has been regarded by

* A paper read before the students of the Architectural Department of the University of Pennsylvania, by T. M. Clark, and published in the *American Architect*.

the contractor as the agent of the owner for waiving the contract stipulations, and that his zealous suggestions have formed the basis for a long bill of extras, which his departures from the proper judicial attitude of the architect have precluded him from rejecting. Contractors are quick to see and take advantage of this sort of carelessness on the part of the young architects, and the latter should make up their minds that this is one of the disadvantages of their inexperience, which they should make good to their patrons by special caution.

In general, there is but one rule to be remembered in regard to the architect's authority—that it is exactly what is granted him by agreement of the owner and the builder in the contract, and neither more nor less. If the contract says that the work shall be satisfactory to the architect, it must be made satisfactory to him, if it has to be pulled down and rebuilt a hundred times in order to make it so, provided that his dissatisfaction is genuine and not fraudulent or wilful. He is not obliged to give any reason for his dissatisfaction; it may even be proved, as it has been in one case, that the work, as executed, is better than it would be if it were done as he wants it; nevertheless, the contract will hold good and the work must be done over again to suit him, or the contractor cannot recover payment for it. His objections need not even be reasonable. It has been proved that the dissatisfaction was due to ignorance of the subject, but without avail, the law holding that when one undertakes to do work to the satisfaction of another, his contract is not fulfilled by doing it to the satisfaction of some more learned person. In most contracts this clause gives practically all the authority that the architect possesses over the conduct of the work. Although contracts often say, very unwisely, that the work is to be done under the direction of the architect, this clause has not much meaning, for it does not give him any power to change the provisions of the contract and specifications, and to carry these out to his satisfaction obviously involves compliance with the conditions on which, as he informs the contractor, his satisfaction will depend. To give the architect, in so many words, the direction of the work, gives him therefore no more real power in looking after the owner's interest, while it may involve the owner in liability for accidents occurring during construction.

Many contracts constitute the architect arbitrator between the owner and the builder in disputes over matters concerning the building, and a few give him authority to order extra work done. In regard to arbitration, it is well enough to appoint the architect arbitrator between the parties. He always knows more about the subject matter of the dispute than an outsider, and generally decides fairly; and his services cost nothing, while a regular arbitration or a law suit is almost invariably, after great trouble and expense, decided by the adoption, by the arbitrators or the jury, of the architect's opinion, as shown in his testimony. As to the architect's authority to order extra work independent of the owner, it is perhaps sufficient to say that this provision in contracts is becoming obsolete in this country. It is of very little advantage to the owner and is a burden and nuisance to the architect, and the misunderstandings which arise between the owner, contractor and architect where it is inserted and acted upon are so frequent and serious that it is better omitted.

The contract being signed, and the authority of the architect defined by it, let him beware of exceeding this authority in the slightest degree. Many architects appear, when the construction of the building is fairly begun, to put the specifications away and forget all about them, giving orders as if no document existed to show in black and white just what the contract required to be done. It is hardly necessary to say that this is a most hazardous proceeding. Unless the contract expressly gives him the right to do so, the architect has no authority whatever to alter or waive a single item of the contract between the owner and the builder, and, if he does so without authority, he is liable in damages to the party injured. If he sees that the interest of the owner would be promoted by a modification of the requirements of the contract or specifications, he may very properly suggest to the owner the advisability of having the modification made, of course by the owner's order; but he should not order it himself, and still less should he take upon himself to authorise the omission of any work that the contract and specifications call for. Clients of a dyspeptic disposition sometimes reproach an architect who points out to them the propriety of a modification of the contract with having failed in his duty in not having thought of that improvement before, but neither the law nor common sense expects an architect to make plans at the outset which cannot be improved upon, and the bashful architect, who would rather sacrifice safety than confess that he is not infallible, is likely to find his client still more dyspeptic, and with more reason, when he comes to inquire, at the completion of the building, into the cause of the departures from the specification which he has discovered.

Supposing that the architect has set out with well-matured plans, a good and full specification, a clear and precise contract, and a settled resolution not to exceed his authority, and to try to look at the owner's side fairly, in case of differences

of opinion, he has still something to do in the way of guarding himself against intentional deception and oppression on the part of contractor, or owner, or both. So far as private owners are concerned, it is only fair to say that the great majority of them mean to treat their architects honestly, and even generously; and that, in the disputes which arise from their connection, the architect is generally to blame, either for having really neglected his client's interest, or for having failed to come to an understanding in proper season as to what he should be expected to do, and what he should be paid for doing it. Owing, no doubt, to the pernicious practice, which formerly prevailed much more in the profession than it does now, of offering to "submit sketches," without charge, for projected buildings, most people have a most exaggerated idea of the amount of work that an architect is willing to do for the bare chance of being employed; and many are the cases in which an owner, who may be a building committee or a clergyman, leads an architect along from sketch to sketch, alternative plan to alternative plan, supposing all the time that the architect is doing, what he supposes to be, this trifling service as an amusement or as a favour to the church, while the architect as the number of drawings and charges for the draughtsman's time pile up, grows more and more discontented and anxious to know when he is going to get paid, until in desperation he sends in a bill, and from that time there is war between him and those who supposed themselves to be his patrons. In order that such mishaps may be avoided, the architect should set a fair value on his work and should give notice when he intends to ask payment before he does the work. There is no objection to an architect's doing a certain amount of work gratuitously. Many building projects cannot be carried out without interesting a number of persons in them, and in order to interest them, it is often necessary to have plans and perhaps estimates ready to show them. In such cases, some one man usually goes to an architect of his acquaintance and asks him if he will make such plans, with the understanding that his time may be lost if the project fails. The architect is, of course, free to accept or decline the proposal, but if he accepts what is, in most cases, honestly meant to be a favour to him, he should make his acceptance distinct in its terms, showing that he considers his services of value, but that he consents to make an important contribution of work to assist in carrying the project through. In this way all parties know what they have to count upon, and the architect will maintain the essential point of the value of his work. It should not be forgotten that most people value professional service in proportion to what they pay for it; and the architect who is ever ready to submit a sketch on approval is very apt to find that he is set aside in favour of some professional brother whose superior merit consists mainly in the fact that he will do no work without being well paid.

Where, however, the person employing the architect has no claim to gratuitous service, let it be distinctly understood just what the charge will be before anything is done for him. If he does not wish to pay the charge, the architect will have escaped a quarrel, as well as a waste of time, and if he is willing to pay it the whole affair will then go on smoothly and satisfactorily to all parties. It may be said in passing that the would-be clients who think that the proposed charge is too high very often come back subsequently with altered notions on the subject, and make admirable clients; while, unless this preliminary explanation had been gone through, their relations with the architect would probably have resulted in making them his enemies for life.

With public bodies or the representatives of such bodies the architect must be far more cautious. It would take many hours to detail the disappointments, the deceptions and the swindles which architects suffer from committees. As individuals, the members of such committees may be perfectly honest, but where the responsibility is divided the sense of honour is divided also. To my mind architects should show no favour to any representative whatever of any public body or place any confidence in them. If such bodies wish for professional service let them contract for it on proper terms, and by a contract which cannot be broken or repudiated. The profession has seen enough of poor old architects hanging year after year around the lobbies of Congress, trying to urge the passage of a Bill to reimburse them for work done for the public benefit, and under the order of congressional committees, but without the proper guarantees of payment, and of men of talent dying in the prime of their faculties, sometimes even by suicide, through the burden of ingratitude and oppression which they have endured in trying to serve their fellow-citizens; and it has made up its mind that hereafter the public shall come to it honestly or shall go without its services.

For these reasons let the architect who has to work for a State or town or city, or for a church, guard every step. In such cases, where building work is done in pursuance of some statute or ordinance, accompanied by a definite appropriation, it is of the greatest importance that the cost of the work shall not exceed the appropriation. If the young architect will

reflect he can easily see how embarrassing is the position of the members of a public commission or a building committee who are compelled to report that they have, without warrant of law, exceeded their appropriation. Such a confession is at once seized upon by the political opponents of the commissioners to injure them, and they are tolerably sure to visit their resentment on the architect if he can be made to appear at fault in the matter. He should therefore never be at fault in this way, either really or apparently. If the appropriation is inadequate, as it usually is, he should warn the commission of this fact at the outset, fortifying his opinion, if possible, by a careful estimate from some contractor of reputation as soon as the plans are in shape for estimating. If the commissioners grumble, it is better to have them do so at first than afterwards, and the architect may be well assured that in their hearts they will prize him all the more for his disposition to see that they do not get themselves into financial trouble. If they tell him, as may happen, that there will be more money ready when the first appropriation is exhausted, he may take them at their word; but he should not fail in this, as in every other case where he talks of business matters, and particularly in regard to the cost of the building with them, to make notes of the conversation immediately afterward in the memorandum book which every architect should always have with him, recording as nearly as possible what was said by each party, and making a list of the persons present at the discussion. Such a precaution may seem to show a painful lack of confidence in the members of the commission, but it is absolutely necessary. Even if the architect is not obliged later to use his note-book for summoning witnesses in his own behalf, and for cross-examining the people who are endeavouring to throw on him the blame for troubles in connection with the building, it may be of immense value in various ways to the commissioners themselves. Remembering, therefore, that in all public work financial precision is superior to every other consideration, the architect, armed with his well-filled note-books, and with skill, diligence and honesty, can pass with tolerable safety through the dangers of public employment; and the same precautions will help him in his relations with private individuals. In most cases the financial consideration is not really so paramount in private as in public work, as a private owner does not have to get a law passed to enable him to put his hand in his pocket for a little more money to carry his building to completion; but it must never be forgotten that if a man wishes to quarrel with or defraud his architect, he always begins by charging him with having exceeded his instructions in regard to the cost of his building; and it is useless for the architect to explain that the owner instructed him to introduce features which could not be included in the specified sum, courts always holding that where the owner's instructions in regard to the cost of his building and its accommodation or design are incompatible, the architect must be ruled by those relating to the cost, so that unless he can prove to the satisfaction of a jury, and against the solemn asseverations of the owner, that he gave plain warning to the owner in all cases where the latter expressed a desire for increased accommodation or a richer style that this would involve greater cost, in the establishment of which his note-book will be of inestimable value, he must be prepared to find that the jury will side with his opponent.

If he should be so unfortunate as to have any of his controversies decided in court, he will find it desirable to know just what the law requires of him as a professional man. Many clients imagine that it is the architect's duty to divine exactly what his client wants, to satisfy all his requirements, at the first trial, in a plan which will need no modification, and can be carried out for just what the client wishes to spend, and during the progress of the work and afterwards to guarantee the exact compliance of all the contractors with their agreements. Fortunately for the profession this view is an erroneous one. The law is well established that what is required of the architect is reasonable skill and care, with, of course, perfect honesty. What is reasonable skill and care is, by the best decisions, a matter to be decided in accordance with the testimony of other experts, that is, of architects and perhaps builders; that is, the jury is not to be allowed to infer, from the circumstance of defects in a building that the architect is at fault, but must ask other architects whether his conduct was such as reasonable professional care and skill required. The same rule applies to the architect's responsibility for defects in workmanship. It is not he who has agreed to build the house in accordance with the specifications, and he cannot be held, under our law, accountable for the contractor's misdeeds, unless he has failed to show reasonable care and skill in supervision, a matter which must, as before, be established by expert testimony, not by inference.

It would be easy to add much in regard to the precautions which the architect should observe in other relations, but the principle is the same in all—that his client's pecuniary interest is the first to be considered and that he should give fair warning where extra cost will be incurred, and should be prepared to prove that this warning was given, and that, having thus looked

out for his client's pocket, he must do what he is instructed to do skilfully, diligently and carefully, without assuming any authority not expressly delegated to him, and at the same time without abandoning the authority which is so conferred upon him.

ST. GEORGE'S HALL, LIVERPOOL.

A REPORT has been prepared by Alderman P. H. Rathbone, as chairman of the finance sub-committee of the Liverpool Corporation, in which he proposes a scheme for the completion of St. George's Hall. According to the abstract in the *Liverpool Courier*, it is explained that in the year 1836 the Liverpool Council decided to erect a building containing a large concert hall to accommodate the musical festivals, which it was, at that time, intended to hold periodically, and the courts for the assizes, just established, the concert hall forming the centre and the assize courts the two wings. A design for this building was offered by Mr. Elmes, which was at once accepted as a real inspiration of the highest genius. Mr. Elmes, seizing the advantage of having one main hall and two subsidiary halls all lighted from the roof, conceived the idea of a Classic building, which whilst avoiding the strict monotony of an ancient temple, would combine unity and simplicity of conception with a richness and variety of sculptural detail which would at once stamp it as the finest modern specimen of Classic architecture in the world. The first stone was laid in 1838, on the Coronation Day of the present Sovereign. Mr. Elmes's early death unhappily prevented his superintending the completion of the building, but Mr. Cockerell proved himself capable of carrying out Mr. Elmes's scheme, so far as the shell of the building was concerned, and successfully commenced the sculpture required for its completion by the group on the pediment, in which it would appear he was assisted by Mr. Alfred Stevens, but to what extent is not known. The partially completed building was opened in 1854, which was not a very brilliant period of English sculpture. The Council seem to have feared putting so important a work into incompetent hands, and nothing more was done for some years. In 1882 (the prospects of English sculpture having very much improved) Sir James Picton proposed that the Council should endeavour to complete worthily what would be the chief glory of Liverpool, if not spoiled by incompetent hands, and a commencement was made by commissioning Mr. Stirling Lee, after a severe competition, to carve certain panels on the east side of the hall. Doubts were aroused in the minds of some members of the Council as to the success of the first two panels, which delayed the work for some years; but at length, in 1894, Mr. Stirling Lee was enabled to complete the first six panels, and their singular success in carrying out Mr. Elmes's conception was universally admitted. For several cogent reasons the work should now be vigorously, but cautiously, pressed forward to completion. The building would then be a monument perfectly unique in its successful adaptation of Classic architecture to modern uses, and give an idea of the glories of Greek work in its most perfect development. A general tone and character would then be given to the city, which would induce travellers to class Liverpool with the great cities of the world which must be seen. Such a building, for example, would have no small effect in inducing foreigners to select Liverpool rather than Southampton as the city at which they would land on the way to Europe. While other cities, duly impressed with the value of great public buildings as giving importance to them, are apt to attempt to gain this by size rather than beauty, each striving to build the biggest, Liverpool would possess one which, while large enough to give full dignity and grandeur by its size, would chiefly demand attention by the singular beauty of the general idea and of the subordinate details. Owing to the difficulty of adapting the classical forms to modern requirements it would probably remain unique in its character, and be quoted as the only really successful attempt in the world to revive the full glories of one of the finest periods of architecture. Fortunately the opportunity now offers itself. During the last few years a young school of sculpture has arisen in England, which promises to be the finest England has ever seen, and one of the finest in the world. Whether it is to be permanent or not depends upon the encouragement it receives, especially the encouragement of that monumental sculpture, combined with architecture, which forms the highest and most permanent branch of this art. If it does not receive such encouragement it will die out, and England will incur the discredit of having starved out one great element of its genius, and will seriously alter her position among the civilised nations of the future.

Though, unfortunately, many of Mr. Elmes's plans and drawings have disappeared, he has, on the building itself, indicated the position and nature of the sculptures necessary for its completion, the panels for relief sculpture, the bases and pediments for the statues, &c. These Mr. Lee has worked out with great care and sympathy, so that we know what has to be done, and have only to proceed with the work. During its progress

we shall gather to Liverpool skilled workmen of the highest class and set an example which will, no doubt, have no unimportant effect in inducing great companies to erect noble buildings, thus causing Liverpool to take a leading position in the great rebuilding of the cities of England, which will be a prominent feature of the first half of the twentieth century. This will make it a favoured home of those skilled artisans upon whom, in the early future, the industrial greatness of our nation must chiefly depend. The first step would seem to be the completion of the south end of the east wall by placing the requisite figures over the panels already completed, representing the growth of Justice. No nobler inauguration of Greater Liverpool could there be than the completion of this monument of the higher civilisation of a great city. A great and large-minded millionaire could confer no more permanent gift on the city than by undertaking its completion, and it would be one that would hand down his name for many centuries, as the name of Pericles has been borne down to our days by the Parthenon. But it would be far more satisfactory if the city, as a city, would itself accept the responsibility which devolves upon it, and thus enable every citizen of Liverpool to feel an honest pride in being so, and having contributed to build the finest building of its kind in the world. St. George's Hall has, according to the statement in the annual accounts of the city treasurer, already cost 317,000*l.*, and it cannot therefore be thought that the carrying out of the above work, which it is estimated will cost 40,000*l.*, is by any means extravagant, seeing that ten years will be occupied in its completion, and the sum of 4,000*l.* per annum only be required for that period.

Along with this report of Mr. Rathbone is given a scheme, dated December 22, 1894, by Mr. Thos. Stirling Lee, for the sculpture decoration of the hall, the details of which were given some time ago. Mr. Rathbone's scheme is artistic in its inception, and comprehensive in its scope. Whether, in the present condition of trade and the finances of the city, it will just at present receive the necessary sanction from the public and the City Council remains to be seen.

THE WORKS AT PHILÆ AND THE PARTHENON.

AT last week's meeting of the Society of Antiquaries Mr. Somers Clarke, F.S.A., gave an address on these two questions. He said that Mr. Garstin at the end of last year officially announced that the irrigation scheme would be modified in such a way as to reduce the highest level of water in the reservoir to 106 metres above sea-level, and it was expressly stated that this change was made in consideration of the pleas urged on behalf of art and archaeology. The result could not fail to give great satisfaction to all who were interested in the remains of ancient Egypt. Referring to the Parthenon, which he had recently visited, Mr. Somers Clarke stated that the building was in extreme danger. The structure had been much neglected ever since the great injury which it sustained about the middle of the seventeenth century by the explosion of a powder magazine, and it had been much battered during the wars of independence, and was, moreover, frequently shaken by small earthquakes. Eminent French and German architects had, at the request of the Greek Government, reported on the structure, and a distinguished German architect would probably be asked to take the work in hand. It was matter of earnest hope that no attempt at so-called restoration would be made, and that the needful reparation might be so effected that a non-professional person could not discover that anything had been done.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting of this Association was held on Thursday night, the 30th ult., in the Royal Institution, Princes Street, Edinburgh, Mr. W. W. Robertson, F.S.A. Scot., president, in the chair. The treasurer, Mr. John Johnston, C.A., intimated that the membership had increased to 295, and that the funds were in a satisfactory condition. Other reports were submitted and were approved of. The following office-bearers were elected:—President, Dr. Rowand Anderson; senior vice-president, Mr. Thomas Ross, F.S.A. Scot.; vice-president, Mr. J. Balfour Paul, Lyon King at Arms; and the secretary, treasurer and librarian were re-elected to their respective offices. The President, in his valedictory address, after referring to the great success which had attended the visits of the Association during the past few months, and to the large attendances, suggested that all members interested in these visits should communicate either to the secretary or the president suitable places of interest as they occurred to them. He afterwards referred to the fact that in his inaugural address three years ago, he had spoken of the various projects which from time to time were heard of for the rebuilding of the City Chambers or of their removal to

the New Town. He was glad to say that the question had now been definitely settled, and settled satisfactorily, by the Town Council, on the initiative of the Dean of Guild. The Council, he said, was now acquiring property in the neighbourhood which would give the accommodation required and would complete the building in a satisfactory manner. The effect of what would otherwise be a very dignified square was marred by the inclusion of the block at the north-west corner, which was now to be removed. He hoped that when the work was completed the Council would see its way to improve the façade to the High Street, which was marred by the intrusion of a range of very second-rate shops. If these shops were replaced by a system of suitable arcades the city chambers would then be housed in a building which would be a credit to the city, and which would possess a repose and dignity which would probably be looked for in vain in modern buildings—qualities which the exigencies of modern competitive designing went far to render impossible. Referring to the widening of the North Bridge and the probability of a demand being made for the removal of the Tron Church, the President strongly reprobated any such event as interfering with an interesting landmark connecting modern times with the time of Charles I. The new President then took the chair, and returned thanks for the honour the Association had conferred upon him, and votes of thanks to the retiring President and the other office-bearers brought the proceedings to a close.

GENERAL.

The Slade Professorship of Fine Art in the University of Oxford becomes vacant at the end of the present term. The electors will proceed shortly to the election of a professor. Candidates are requested to send in their names to the registrar of the University on or before June 27. Testimonials are not required. The professorship is tenable for three years. The professor is required to give annually a course of not less than twelve lectures on the history, theory and practice of the fine arts, or of some section or sections of them.

The Hon. R. B. Brett, son of Lord Esher, has received the appointment of secretary to the Office of Works in succession to Mr. H. W. Primrose.

A Stained-glass Window, by Messrs. Heaton, Butler & Bayne, has been presented to the parish church, Stratford-on-Avon, by Mr. W. Law, of Honresfeld.

M. Rodin's group of Eustache de St. Pierre and his five companions, who are represented as Froissart describes them, in their shirts with ropes round their necks, was unveiled in Calais on Monday.

The Jurors have been unable to discover one design in the section of architecture of the Salon that is worthy of the médaille d'honneur, or of a medal of the first class.

Mr. E. B. Tylor was on Tuesday appointed Professor of Anthropology in the University of Oxford. Hitherto he held the readership.

The Episcopal Chapel of St. Jean, in Périgueux, which is in a ruinous state, is to be preserved at the joint expense of the Municipality and the State. It dates from 1521.

A Conference of representatives of the technical instruction committees of various county councils and others will be held at the house of the Society of Arts on the 20th inst., with the object of considering the present lack of a central organisation which might deal especially with such questions as the examination and inspection of classes.

Mr. B. I. Barnato has purchased the freehold property at the corner of Park Lane and Great Stanhope Street, formerly belonging to Mr. John Malcolm. The house will be rebuilt at once from the designs of Mr. T. H. Smith.

The Society of Engineers will in future hold their ordinary meetings in the lecture theatre of the Royal United Service Institution, Whitehall.

Mr. H. W. Umney will read a paper on "Safety Appliances for Elevators" at the meeting of the Society of Engineers on Monday, the 10th inst.

A General Meeting of the Glasgow Institute of Architects was held on May 30. Mr. T. L. Watson presided. Messrs. W. F. Salmon and John James Burnet were re-elected governors of the Glasgow School of Art for three years from August 1 next.

Mr. John Smith, architect, of Sholley Bridge, died on Sunday night in his seventy-fifth year.

Messrs. Perken, Son & Rayment have undertaken the agency for the sale of photographic dry plates manufactured by Messrs. Guerquier, of Ghent, Belgium, within the United Kingdom. Exhaustive trials have been made with these plates, and they are found to be most satisfactory, uniform in quality, and always trustworthy. The prices are, however, most moderate.

The Architect.

THE WEEK.

AMONG the smaller exhibitions now being held in London, that of the Dudley Gallery Art Society ought not to be forgotten. The collection at the Egyptian Hall, Piccadilly, is just now full of the work of the lesser-known British artists, and it is at exhibitions such as this that bargains can be picked up for almost nominal sums. The picture for which Miss WALTER modestly asks 3*l.* 3*s.*, No. 417, would, if it were exhibited under other circumstances, have a much higher figure attached to it. The same price is asked, we believe, for some of Mr. MAY's Sussex scenes, which, as usual, are excellent. Those sent in by Mr. TRAVERS are very telling. The president, Mr. WALTER SEVERN, contributes several examples; one, his *View from Mentone*, is capital. Mr. F. J. ALDRIDGE's *A Pilot Wanted* is a fine study in brown and white. Miss MANBY sends a couple of sketches of old-fashioned folk. Mr. CARTWRIGHT's *Whitchurch Lock* is carefully painted, and the same can also be said of Mr. MEDLYCOTT's *Venice*. It is impossible to mention all the excellent pictures that are to be seen, so we will content ourselves with advising amateurs to go and judge for themselves of numerous drawings which are promising.

A COMMITTEE of the House of Commons on subways in London was amazed when a section of the ground in front of the Mansion House was exhibited, showing a countless number of used and disused pipes, and among the latter were some wood conduits, which apparently it would be actionable to meddle with. The use of wood pipes now seems to be on a par with prehistoric boat-building out of one trunk of a tree. Yet the Americans have tried the experiment of "wood stave" conduits and consider them to be satisfactory. At Denver, which is familiar to readers of BRET HARTE's stories, and now has a population of 150,000, nothing else has been used for the water supply during the past ten years. One conduit 37 inches diameter is 5 miles long, another of 30 inches extends for 16 miles. There are also pipes of 44 inches, 36 inches, 34 inches, and as small as 12 inches in diameter. The pipes are made up of staves of pine; there is a small tongue of iron at one end of each, which fits into a groove in the next stave. The staves are laid to form a circle. We might describe the construction as cooper's work on a very big scale, but instead of the iron hoops at long distances, there are steel bands placed close together around the staves and fastened in iron shoes. Where penstocks are required they are of iron. The system is found to be economical in the timber district, of which Denver is the capital, and apparently there are no disadvantages attending the use of wood.

ANYONE who is desirous to test the efficiency of the jointing in gas mains has only to take a little earth from one of the cuttings which are opened in London, and if, when taken into a room, the odour is not oppressive, then there will be an exception to what generally occurs. The leakage in the mains is surprising. According to a paper which was read at the meeting of the Incorporated Gas Institute at Edinburgh on Tuesday, by Mr. D. IRVING, there is an increase, comparing 1893 with 1883, of 6,000 cubic feet per mile of main. The total quantity unaccounted for in the United Kingdom has increased during eleven years by 1,834,337,000 cubic feet; and any apparent saving there might appear to be in the gas unaccounted for, expressed per ton of coals or per cent. of make, was a delusion. Mr. LEWIS T. WRIGHT attributed the loss, assuming the meter registrations to be reasonably correct, to be mainly due to defects in the distributing system. On the other hand, it was the opinion of many engineers and managers that the circumstances and conditions surrounding numerous undertakings were such that it was impossible to obtain the crucial point Mr. WRIGHT assumed, namely, that of correct meter registra-

tion as between the works and the average consumer's meter. To arrive at a correct estimate of the differences existing between the gas made and sold, Mr. IRVING desiderated correct measurements at the works, consideration of temperature and pressure—aspects of the subject which, it was thought, had been somewhat neglected—the use of first-class materials and workmanship in gasholders, mains and services, proper oversight of consumers' meters and thorough organisation and attention to detail in every department of administration. The competitive system of purchasing stores and material by tender, and scouring the country from Land's End to John o' Groat's, in order to save the fraction of a penny, is not conducive to securing the best article, and certainly not the cheapest. There is no more admirable feature in the management of the South Metropolitan Gas Company than the consistent manner in which they stick to tried and proved firms and contractors who have served them well, some of them for more than a quarter of a century. There is no royal road to secure the reduction of unaccounted-for gas. It is only to be secured by attention to a thousand little things in every department. With wise and well-directed energy, ultimate success is certain.

It is a pity that Judge GREENWELL, who presides in the Gateshead County Court, has not a seat in the Queen's Bench Division of the High Court, for he appears to understand that the performance of architects' work should not be its own reward. On Tuesday Mr. THOMAS REAY, of Newcastle, claimed 45*l.* from the churchwardens of St. John's, Low Fell, for professional services in connection with a proposed parochial hall and Sunday schoolroom. His honour gave judgment for the plaintiff for the full amount claimed and costs, and in doing so he characterised some remarks in the correspondence as a gross insinuation without justification upon Mr. REAY's character. No man could be expected, said the judge, to work for nothing, and he thought that the vicar should have realised that an architect was worthy of his hire. It is not often there is so definite a declaration about the equity of an architect's claims, and we hope Judge GREENWELL's precedent will not be without effect in other courts.

THE competition designs for the new Settlement Buildings of the committee of University Hall will be on public view at Dr. WILLIAMS's Library, Gordon Square, W.C., on Tuesday next, the 18th inst., from 10 A.M. to 1 P.M., on Wednesday from 10 A.M. to 10 P.M., and on Thursday from 8 P.M. to 10 P.M. The architects invited to compete are Messrs. C. C. BREWER & A. DUNBAR SMITH, M. S. HUTH, GERALD HORSLEY, A. H. MACKMURDO, E. W. MOUNTFORD, ERNEST NEWTON, E. S. PRIOR, HALSEY RICARDO, W. STIRLING, F. W. TROUP, F. WALLER and H. WILSON. The honorary assessor is Mr. R. NORMAN SHAW, R.A.

A YOUNG architect who was likely to have made a name died on Whit Sunday near Gibraltar. Mr. HEBER RIMMER was the son of Mr. ALFRED RIMMER, the Chester artist, and was born in 1869. He was an articulated pupil to the firm of Messrs. DOUGLAS & FORDHAM, architects. In the winter of 1890 he carried off the silver medal of the Institute, his contribution being a drawing of Compton Winiates, and in 1891 he secured the Soane Medallion Travelling Scholarship by a design for a chapter-house, and three silver medals in national competitions at South Kensington, while in all local competitions he was invincible. Mr. RIMMER had travelled in Spain, and last year he gave a lecture on the country he had visited before the Chester Archaeological Society. He was also recently the editor of "Sketches," the magazine of the Chester Art School. He was obliged to winter abroad this year owing to his health, and he visited Algiers and the Mediterranean. Encouraging news had recently been received from him, but unfortunately the end came suddenly. Mr. HEBER RIMMER will be greatly missed in Chester among a large circle of friends, by whom he was much esteemed and respected, and much sympathy is felt for his bereaved relatives.

CLIENTS' INTERESTS.

IN every business which presents manifold aspects when seen from within or from without it is unsafe to concentrate attention on one alone. Architecture is in that position. An architect is supposed to be an artist, but there is no doubt he is an agent, and although he might escape damages if he jumbled styles in a building or was indifferent to the proportion of columns or the beauty of ornament, it is very doubtful now whether any negligence in his agency would be excused by a judge or jury. We say now, for every one who studies the operations of the Courts must realise that decisions are becoming less and less mechanical in applications of precedents. There are not new Acts regulating the relations between architects and clients, but the advance of time and the changes in the common ideas of men and things have the effect of modifying judicial and other opinions about those relations. The alteration can perhaps be more clearly exemplified in a case relating to another art, which arose elsewhere. Can any one imagine that ten years ago a French Court would have condemned Mr. WHISTLER in damages because he failed to deliver a portrait? He might have been told to return the cheque he received on St. Valentine's Day, but there would be as much likelihood that it might have been looked on as a tribute of admiration of the painter's ability or a display of patronage, and in either case the money belonged to the artist. In the history of art there are several cases recorded of painters who declined to part with portraits, or transformed them into satires of the subjects. Painters, like other artists and authors, were considered to be an irritable race, and people put up with the freaks which inspiration occasionally played as one of the consequences of the possession of genius. But in these prosaic days a work of art is placed on the same footing as a mechanical production, and MICHEL ANGELO would be held to an engagement with as little allowance as would be made to a man who turned out carvings by machinery. Mr. WHISTLER was treated as if he were a sort of photographer. Only a short time since several French authors and artists by their action proved that they were as ready to apply a stringent rule as the rest of the world. They gave a commission to one of the greatest sculptors for a statue, which was to be delivered on a certain date. With such clients repeated alterations were inevitable, and the model assumed an incongruous character. The sculptor at last became embarrassed in his efforts to co-ordinate strange notions with an ideal of his own. He waited in the hope some happy thought would come to his rescue. The committee held him to the letter of the agreement, regardless of the impediments they created; they insisted on the delivery of the statue on the day appointed, and it was only by strong pressure a lawsuit was avoided. That it would be decided against the sculptor cannot be doubted.

When we find men of genius are so exacting in their dealings with one another in Paris, which is supposed to be the capital of art, it is no wonder that elsewhere we see evidence of the application of a rigorous measure from which architects are not exempted. We published last week an address to American students, which was really a warning against the too prevalent assurance that an architect is saved from all consequences as long as he is supposed to exercise his judgment and display ordinary care in his duties. A case was mentioned where one architect was obliged to pay 1,000*l.* to the widow of a man who was killed "by a mishap during a building operation carried on solely by contractors." In another case a firm of architects "were pursued in the Courts for manslaughter, because, as was alleged, they were not present to see that the contractor set properly a roof truss in one of their buildings." They were no doubt American cases, and it does not always happen that judgments have equal weight on both sides of the Atlantic. Lawyers, however, know that in the States there is often an anticipation of English decisions, for both are derived from common principles; and from the present tendency of opinion in our Courts it is not unlikely that architects who are defendants will find they can escape on easier terms at English assizes than befell architects in St. Louis or Chicago.

Some cases have occurred quite lately in England in which architects, on the advice of counsel, found it wiser to

compromise actions by paying damages than to appear in Court, when not only damages would be assessed, but reputations would suffer. The majority of those cases would be fought out if they arose a few years ago. Formerly clients were afraid to run the risk of incurring costs in an attempt to demonstrate a sort of ethical or psychological problem, for what else is an endeavour to prove that an architect has not displayed the care or skill which was anticipated? A few days back an insignificant action was tried in remote Elgin with an architect for defendant. It arose out of the building of a cottage, and all the damages that could be demanded amounted only to 50*l.*, although the expenses will most likely amount to more than the cost of the building. But small as was the scale of the action, the grounds were set out in a way which suggests what is the vulnerable point in an architect's practice. The following paragraph is an example:—"Instead, however, of discharging his professional duty with reasonable skill and diligence the defendant grossly neglected the plaintiff's interest. In particular, he failed to supervise the various contractors, and to see that the materials supplied were of the quality and description suitable and as provided for in the specifications. He failed to fix any date for the completion of the different sections of the contract, and he totally failed to exercise that personal supervision over the contractors' operations which the plaintiff was entitled to rely upon receiving at his hands as a professional architect." The departures from the specification apparently were the use of one large instead of two smaller panes of glass, a slight change in a skylight, and some trifling extras. But they constituted changes which were supposed to be outside the authority of an agent, and hence the architect was charged with grossly neglecting his employer's interest.

It does not matter whether the building in question is a cottage or a castle, a church or a cathedral, that question of "interest" is common to them all. No perfection in design will compensate if "interest" in one of its myriad varieties can be proved to have suffered in any way during an architect's engagement. Beauty is still an indeterminable quality to lawyers, and, unluckily, to many clients also. Now, every architect who is worthy of the name must be possessed with a desire, in common with painters and sculptors, to create forms that are beautiful. It will be admitted also that it is generally stronger than the desire to insure convenience in internal arrangements. But, as commonly happens a client is more eager for his own convenience than for gratifying other people by the sight of a handsome building, the creative power of the architect is accordingly checked to an extent which is unknown to other artists. Painters and sculptors can enjoy the satisfaction of allowing their genius full sway, a musical composer has rarely to accommodate a score to the peculiarities of a singer, while the architect has to submit sometimes to the fads of servants. There is no getting over these drawbacks, no philosophy can make them bearable. But they cannot be evaded, for any neglect of them will be construed into a failure to use skill and diligence to secure a client's interests which no lawyer who identifies an architect with an agent can ever excuse.

The Annual Meeting of the Devon and Exeter Architectural Society has just taken place. Mr. Arnold Thorne was elected president for the ensuing year and Mr. Crocker vice-president, Messrs. Warren, Commin and Cole were elected on the council, and Mr. Tait was re-elected hon. treasurer. The resignation of Mr. Warren as hon. secretary was accepted with regret, and the selection of a successor was left to the council. Mr. Ballan was reappointed assistant secretary and librarian. The proceedings closed with a vote of thanks to Mr. Jerman for presiding.

The Late Sir George Scharf has bequeathed to the British Museum his letters, correspondence and original writings, excepting such as the executors in the exercise of their discretion may withhold. He bequeaths to the National Portrait Gallery his Order of the Bath and his sketch-books, note-books and annotated catalogues upon certain specified conditions. To his friend, Mr. Augustus W. Franks, of the British Museum, the testator bequeaths his manuscript materials for a much needed work on the chronology of art. The gross value of the personal estate has been entered for probate at 1,349*l.* 4*s.*

PUBLIC LIBRARY, BOSTON.

WE have already given an exterior view of this building from an illustration in the *American Architect*. We now give one of the interior views, which will suggest where some of the paintings will be placed which have been seen in the Royal Academy and elsewhere.

Mr. Waterhouse, some finely wrought decorative work from Mr. Aitchison, organ-cases from Sir Arthur Blomfield and Mr. Bodley, and a variety of contributions from Mr. T. G. Jackson, Mr. Basil Champneys, Messrs. Aston Webb & Ingress Bell, Mr. H. Wilson and Mr. John Belcher. By a curious chance—unless we are to regard it as an example, rather, of a new desire to decorate

PUBLIC LIBRARY, BOSTON.

"THE TIMES" ON THE ARCHITECTURAL ROOM.

IN the concluding article on the Royal Academy in the *Times* is the following notice of the architectural designs:—It is never possible to do justice in a brief unillustrated article to a collection of architectural drawings such as are annually shown at the Royal Academy. In what they promise they are more important to the public than the contents of any other room, for they are the sketches of the buildings of the future, and as we have often said, a man may avoid seeing pictures if he wishes so to do, but he cannot avoid seeing the churches, the houses, the town halls that the architect sets up before his eyes in the streets he frequents. Although we cannot discuss the two hundred designs with the minuteness that many of them deserve, we may say generally that they fairly represent the forward movement which has been so notable in English architecture during the last ten or fifteen years, though the great variety of styles here displayed seems to show that we are as far as ever from arriving at a really national school. With the exception of Mr. Pearson, nearly all the best known architects are represented, some of them abundantly; we have a church and a country-house from Mr. Norman Shaw, an insurance office from

what is specially susceptible of it in church furniture—the room contains at least four highly-ornate organ-cases; it is interesting to see the freedom and effectiveness with which some of them have been treated. A tendency to bring colour more and more to the aid of architecture is also shown in Mr. Champneys's new reredos for Manchester Cathedral (1,419), and, in a still higher degree, in the remarkable drawings of a church at Boscombe sent by Mr. H. Wilson. This architect, we believe, was greatly influenced by the late Mr. Sedding, and is continuing some of his work; he shares with him a love of colour which is not common among architects, and a large boldness—perhaps an over-boldness—in design. It is pleasant to see Mr. Norman Shaw reappearing after a brief absence; his country-house and his church (1,460, 1,467) are examples of original work which are nowadays likely to be passed unnoticed by the crowd, because the influence of the architect has been so great that imitations of his buildings are everywhere to be seen. To illustrate this it would be enough to point to a dozen of the country-houses shown on these walls and to point out their relation, if not to Mr. Shaw's "The Hallams," at least to a number of other and earlier works of his.

The Christ's Hospital question would appear to be settled, or nearly so, when we see a number of competitive designs for

the new buildings shown at the Academy and one of them marked as "selected." This is the imposing and costly group sent by Messrs. Aston Webb & Ingress Bell (1,511), which, to judge from the bird's-eye view here shown, leads us to suppose that the Christ's Hospital of the future will boast of the most magnificent school buildings in England, or perhaps in the world. The architect has followed the analogy, though happily not the style, of St. Thomas's Hospital, and has conceived his school as a series of separate houses of similar or identical design, with common public buildings, a large hall, a chapel, schoolrooms and the like. There is a report that the whole thing will cost 400,000*l.*; a long-division sum will easily show how much per boy the cost of lodging alone will be, without reckoning board, clothing or education. Of other large buildings, those which seem most to demand notice are the design for the Darlington Town Hall, by Messrs. Clark & Moscrop (1,570), and Mr. Basil Champneys's for the new Museum at Winchester—the form which the Quingentenary Memorial appears to have taken. This promises to be as successful as the similar building from the same hand at Harrow. The "Staircase Hall, Gosford House," of Mr. William Young (1,595); Mr. Carøe's "Palazzo Hanbury, Ventimiglia" (1,596); Mr. H. C. Corlette's decorative studies in colour; Mr. Gerard Horsley's beautiful sketch of the west front of Wells Cathedral (1,425); and Mr. A. Mitchell's "Week's Sketching in Normandy" (1,523), are all of them remarkable in their different ways.

THE MAYOR OF GATESHEAD.

A PORTRAIT of Alderman W. H. Dunn, mayor of Gateshead, appears in *Northern Gossip*, accompanied by the following memoir:—

Although now the chief magistrate of Gateshead, Mr. Dunn was born in Newcastle in the year 1842, and it was not until the occasion of his marriage in 1867 that he left the canny toon and fixed his residence in Gateshead. From this early stage of his career he quickly rose into prominence both in public affairs and in his professional capacity. Mr. Dunn is an architect practising in Newcastle, his place of business being situated in St. Nicholas Chambers. He was the first pupil of the late Mr. T. Prosser, architect to the North-Eastern Railway Company at Newcastle, and for seventeen years he remained in this employ, acting during the last few years as chief assistant. His architectural work and thorough knowledge of measuring and valuing whilst with this company was of a meritorious character and won him much distinction. In December, 1873, Mr. Dunn entered into partnership with the late Mr. Matthew Thompson, Eldon Square, Newcastle, and since the death of Mr. Thompson, Mr. Dunn has continued to carry on his professional practice under the style of the old partnership. Many well-known buildings, including churches, chapels and county mansions have been built in the North of England from excellent designs prepared by Mr. Dunn, and latterly he has performed creditable work in the erection of two Board schools at Gateshead. The firm are also architects to several landed and building estates in Northumberland, Durham and Yorkshire.

For many years Mr. Dunn was an active member of the Northumberland Architects' Association, for some time fulfilling the duties of secretary, and for two years was president of the institution. His efforts for the promotion of this Society, and his contribution of original papers before the members on different architectural subjects, were honourably mentioned by the executive. He first entered the Gateshead Town Council in 1879, when he sat as a representative of the West Ward. He represented this portion of the borough, enjoying the unabated confidence of his constituents until the redistribution of the wards in 1888, when he was returned as one of the councillors for the North-West Ward. In the year 1891 his ability and twelve years of uninterrupted service to the town was recognised by his colleagues in his election to the aldermanic bench as a successor to the late Alderman Davidson. His association with the Council has been made conspicuous by his active work in the town improvement committee, in which his professional qualifications as an architect and his wide experience of structural matters have proved of invaluable service to his fellow-townsmen in the execution of various public improvements.

A further important position he occupies is that of chairman of the cemetery committee, which he has held since 1891, during which period several improvements have been effected in the cemetery, and it was chiefly through his efforts that within the past twelve months the clergy were induced to forego their charges for headstones and monuments. Mr. Dunn is a member of Durham Road Baptist Church, in which he fills the office of deacon. For many years he took a deep interest in the Sunday-school work of the church and the town generally, and strong evidence of his zealous labours in this

direction was his long occupancy of the post of superintendent of the church school, and his action in the establishment of the Sunday School Union in the borough, of which he may really be looked upon as the founder. In politics Mr. Dunn is a Liberal, but though he chooses to class himself under this shade of party colour he never fails to make it known publicly that he is a supporter of "measures, not men."

Mr. Dunn is an excellent justice of the peace, and takes a great interest in the welfare of the prisoners brought before him. The advice he often gives them is sound and noteworthy, as many have found out to their great advantage.

In private Mr. Dunn is a splendid man, and being no respecter of persons, his lively conversation is free for the enjoyment of all who may be near him.

ART AT THE UNIVERSITIES.

ON Saturday Dr. Waldstein, the Slade Professor of Fine Art at the University of Cambridge, delivered his inaugural lecture. He said that the aim of the artist was to produce art; the aim of the amateur (and all civilised beings ought to be "lovers of art") was to enjoy art; the aim of the student was to understand art. The task which the University student of art had before him was quite distinct from, though it need not be opposed to, that of the artist or that of the amateur. They could not and they need not compete with art academies and conservatoires to produce second-rate painters or sculptors or architects or musicians. But it might be fairly asked whether it would not be well to encourage in the painter, sculptor and musician the amateur's attitude of mind. The effort of producing good artistic work of any kind was so severe, and made such exclusive calls upon the faculties of thought and energy that this very labour and effort might tend to counteract the playful and disinterested attitude of mind which was alone conducive to art enjoyment. Unless the artist kept something of the lover of art in him, something of the amateur, there was a danger that he might become the most inartistic of human beings, to whom the muses were the bringers of pain and not the heralds of purest pleasure. In the same way it might be asked whether it was not wise to encourage in the artist also the attitude of mind belonging to the art student. He ventured to say that the most one-sided views on works of art, the most absolute ignorance of its history, and the most blunted appreciativeness of those works which did not immediately fall into the sacred and exclusive circle of masters approved of came from artists. The chief aim of the art student was the understanding of art in all its aspects. His aim in the first instance was to be purely theoretical, and this theoretical attitude of mind in its fullest and highest form was developed and encouraged in the University. He would urge upon the student the study of the history of art, and in a proper University course all periods ought to be represented. From the humblest beginning to the highest work they ought to follow man's effort in every clime and time. The only period of art which was more or less adequately represented in the University of Cambridge by means of teaching as well as by the recognition of an admission into the circle of University studies and examinations was that of Greek art. He proposed to use his best efforts that the other periods should receive similar recognition and opportunities of study. He held it to be a good sign of an emancipation from the thralldom of examinations that students were more and more breaking through the stereotyped limits of set triposes. The immediate profession for which the University study of art would prepare the student would, in the first place, be that of directors and curators of museums; and, further, it was to be hoped that with the growth and further development of such studies in this country the general standard and tone of art criticism might be raised.

ROSTOCK.

FROM Berlin to Rostock is a trip of four or five hours across the flat land of Northern Prussia, then over the breadth of Mecklenburg to the shores of the Baltic Sea. It is on the high route to Copenhagen, from which city it is, in direct line, only about a hundred miles distant. It is but a short ride over the channel to the Danish islands at this point, and the tall church towers of Rostock guide the mariner nearly all the way. Rostock was one of the old cities of the great Hanseatic League, next to Lübeck the strongest and richest of them all; but she holds political relations to-day with Mecklenburg, one of the most ancient, feudal and non-progressive and, governmentally, most strangely equipped of the states which compose the modern German Empire. The Grand-Dukes of Mecklenburg trace themselves back to the twelfth century, and theirs is the only reigning house in the western world of Slavonic origin. It is their aim to keep up the purity of their race by constantly marrying into the Russian royal family, so that they may be qualified to sit at the head of the meeting

when the Panslavists realise their dreams and break over the bounds into Western Europe.

Rostock is the largest city in Mecklenburg. It has about 45,000 inhabitants, while Schwerin, the capital of the bigger duchy, has but 33,000, and Neu Strelitz, the capital of the smaller, only about 9,000. Rostock is in some senses the capital. There is a palace here for the Grand Duke, Friedrich Franz III. of Mecklenburg-Schwerin, though he seldom occupies it; also the Supreme Courts of the two duchies, the chambers in which the so-called *Stände* meet; and that the Legislature itself does not favour the city when it assembles is because it prefers to camp around in alternate years at two little villages in the interior, down among the lakes and fir-trees of this antiquated realm. The city is also the seat of the 475-year old University of Mecklenburg, and it is the centre of about all the culture and civilisation the little land is able to muster. It is by all odds the most interesting thing in Mecklenburg, and with its mammoth old churches, its curious houses, its walls, gates and moats, and the checkered history of its brilliant past, no traveller in these parts ought to pass the city by.

Rostock is situated up a bay of the Baltic Sea about six miles from the coast. The bay is called a river, the Warnow; but this does not prevent it from having the character of a bay, for above the city it dwindles suddenly away and is navigable for only the smallest boats. In the bay proper the depth is such that large ships may enter, and were it not so far to the east it might have harbour adaptabilities of a kind to eclipse Hamburg. It was its harbour which early made the city such a powerful member of the Hansa, and which gives it still to-day one of the strongest merchant fleets in the Baltic Sea.

Rostock was founded in 1170, though much earlier than this there had been a heathen settlement of Wends on the opposite bank of the river. It reached the pinnacle of its power and prosperity in the sixteenth and the beginning of the seventeenth centuries. Its navy was then the terror of the northern seas, its walls and gates repelled every attacking foreign host, its merchants were the types of luxury and wealth, its University drew to it the ripest scholars of the time and students came from many lands. The history of this old city is, in short, an Arabian Night story, which the visitor comes to feel as a modern reality as he walks through the ancient streets, among the ancient walls and houses, under the ancient arches adown which portcullises used to fall, over the wharves where for centuries have trodden the feet of trade and into the venerable churches, the rare religious monuments of a wealthy past. The city's historical character unfortunately suffered much by a great fire which broke out in 1677, completely destroying many of the smaller buildings and damaging the churches and the larger buildings in such a way that their disfigurement is still noticeable at the present day.

Perhaps the first thing to attract a visitor in Rostock would be the remnants of the city's great fortifications. The city at the height of its power was completely enclosed in walls outside of which, on the landward side, was a moat, one of the most extensive things of the kind in Europe. Though parts of it have been levelled off and converted into park grounds, and other parts have been used by a railroad company to effect an entrance to the town, a very considerable piece of the monstrous ditch is carefully preserved. It is no less than 50 or 60 feet from the top of the earthworks to the bottom of the stream, little though it is to-day, which flows below. Such an excavation was undoubtedly the labour of years, and is marvellous to view when it is recalled how slow and laborious were the methods for doing such work at that ancient time. Having crossed the moat, climbed the high steep bank and mounted the earthworks, there was yet a wall of masonry to pass. All these features of the old fortification system are shown at Rostock. The ditch is now grown up with trees, among which the visitor may walk and look up. He may then walk on top of the great embankment and look down. In summer there are fountains and handsome flower-gardens along these promenades, and the whole thing makes a charming, original and instructive piece of park land.

In the old days everything went by sevens in Rostock, and there was an ancient stanza in circulation among the people which celebrated this peculiarity of the city. It therefore had seven gates, through which outsiders, if they were friends, could come into the city. Of these, only three survive—the Petri Thor (Peter's Gate), so called on account of its nearness to St. Peter's Church, the Stein Thor (Stone Gate), and the Kropeliner Thor. These all date from the thirteenth century. The most interesting of the three, on account of its pictures and inscriptions, is perhaps the Stein Thor. The decorations are of a very ancient pattern, and the city arms are portrayed here in a particularly curious manner. A black griffin, with a double tassel-hung tail, with his wings spread and his feet up, ready for motion, is the symbol of the city everywhere, and it is still in use at the present day. The shields which hold the coat-of-arms are pictured on the inside of the Stein Thor as held up by two lions, which, for curly tails, long, lank bodies,

and wicked, grimacing expression of the faces, excel everything in the catalogue. This piece of Mediæval art is calculated to bring forth a smile from everyone who passes under this curious archway. The griffin in various attitudes is also portrayed on the other two gates. The Kropeliner Thor is architecturally the handsomest of the three. It is of great height, though it has lost most of its earlier ornamentations.

The great churches, once he is inside the walls, will next arrest the visitor's attention. Of these there are four—St. Mary's, St. James's, St. Peter's and St. Nicholas's. St. Mary's is a curiosity which is alone worth a stop in the city to see. There are cathedrals in Southern Europe, but for the man who wants to see something new let him come to the North. Let him visit Denmark, Sweden and Norway, and some of the Northern German cities which have partaken of the Gothic Baltic influence. He will see then what, if it is not always beautiful, is at any rate curious, and that is more than half the joy in looking at a church.

This old St. Mary's is a pile of bricks of massive and stupendous dimensions. Its walls are as thick as a castle's, and on the outside as plain and forbidding. The interest, however, centres in the interior. Here the visitor will at once be impressed with the size of the place. He will run his eyes up the high and fleckless whitewashed walls, so tall that his vision tires before it comes to the ceiling. The narrow windows reaching nearly to the roof seem also to have no end. Yet the ceiling is there, the lofty arches kept from falling together by wooden beams, also whitewashed. In the middle of each little white dome up there is a single gilt star on a blue background. Not another thing to give it colour or decoration. At intervals are suspended chandeliers of candlesticks. The long chains which support these luminaries in mid-air are rough links hooked together centuries ago at some blacksmith's awkward forge. The floor is of gravestones, all bearing dates of two or three hundred years ago.

Once in the middle of the church—with a view of the altar at one end, the magnificent organ and the Grand-Duke's private box at the other, and the pulpit at one side—it is seen at once that this is no mere common provincial church. There is a simple, graceful, artistic beauty here that one may well stop to inspect. There is no way to heat such an immense place in winter, and those who come here every Sunday must sit in the cold. The Grand-Duke has provided against this. In his elevated gallery, surmounted with its golden crown and decorated with its elegant tapestries, he may in cold weather withdraw behind glass, where he can still see and be seen. Beneath the Grand-Duke's box are elevated seats reserved and labelled for the burgomasters, the senators, the judges, the professors, &c. These benches have cushions and fur foot-warmers.

The congregation when it seats itself in this monstrous place will see always before it a cheerful sight. This is the burial chapel of an old Danish king. Over the door of this melancholy vault is a great funeral casket held up by two figures, whom the weight of it well-nigh overcomes. On top of this casket, lying down full-length, with his head comfortably resting on one hand, is the grinning figure of a skeleton. In the other hand it dallies with an hour-glass and the sands of time. At either end of this casket is the figure of a man and woman portrayed as warriors with exposed abdomens which are absurdly expanded and deformed. High in the chapel, over this display, hang the tatters that are left of the war-banners of the old king. This is, beyond any question, one of the most ludicrous things of the kind to be seen anywhere in Europe.

Behind the altar is a wonderful old astronomical clock which dates from 1644. It is of most peculiar and ingenious construction, the work of several local geniuses. There is also a baptismal font here which is reckoned as a treasure. An inscription upon it ascribes it definitely to the year 1290. It will be noticed that at places in the aisles and side chapels models of merchant ships under full sail are suspended from the ceiling. Rostock being a great maritime city, this was anciently done as a propitiation to the gods for the safety of Rostock mariners.

If the other churches of Rostock are not as interesting as St. Mary's, this is not saying that they are without interest. All are built in massive proportions. All are paved with gravestones. All have ships suspended from their ceilings. All have their treasured baptismal fonts. Some contain specimens of wood-carving of very curious pattern. One, St. Nicholas's, has been renovated recently. Its great arches have been closed up, and the interior construction so altered that it now admits of heating, a sacrifice to history, but doubtless a comfort to those who are obliged to sit there every Sunday. Another, St. Peter's, is famous for its spire, a long, pointed construction, roofed with slate, 440 feet in height. It is a guide to Baltic mariners when they are many miles from shore.

The old houses in Rostock in mid-city are a sight on every hand. These are notorious for their front gables, which go up

like a stairway on each side to a central peak. This triangular-looking front is set sometimes with as many as forty windows, arranged in rows. In the first row will be only one or two, but the number increases as the space widens until the lower row is set as thick with them as sparrows on a telegraph wire. Such of them as are preserved in their original form out of the olden time, when glass was scarce, are of wood, except for a small glass eye-hole. Some of these gables are one slope, so that the rain can run down.

There are two old market-places in Rostock, immense plain squares, set with rough stones. The streets are in like manner roughly paved. Even what is new in Rostock is curious. A new monument to Blücher, who was born in Rostock, contains reliefs which represent the warrior driving the demons, bats and wolves, that is the French, out of Germany, by his victory at Waterloo. There is also a monument to the soldiers who fell in 1870-71, with a pair of cannon taken from the French at Metz.

The University was founded in 1418 by special sanction of the Pope, at a time when his consent was necessary. This makes it, with the exception of Heidelberg and Leipzig, the oldest University in Germany. The institution got a new building in 1867-70, which is curious, like everything else in the town. The library is said to have about 150,000 volumes. It is to-day chiefly noted for its chemical school, in which department more than a fourth of its students are registered. The rules still on the books here are extraordinarily peculiar and antiquated. A new student must go and call on the dean within a certain number of days, or be fined so much for contempt. If a student is challenged to duel by another and does not accept within two weeks, the faculty can oblige him to fight, and so on *ad nauseam*.

Rostock is a city which practically governs itself. Though nominally in Mecklenburg, it, like its old Hanseatic sister cities, Hamburg, Lübeck and Bremen, has a kind of republican constitution by which it has acquired in all essential respects the rights of self-government. It has long had independent police and legislative powers, its own courts and its own harbour and shipping privileges. It earlier could coin its own money. It flies its own flag, mounted by its own black griffin, on the high seas, and it has gone on attending to its own business and developing along its own lines, as every rightly-governed city ought. It is still subject in some respects to the ancient laws of Mecklenburg, but it has political liberties possessed by no city in Prussia.

TESSERÆ.

Chinese Lacquer.

THE Chinese lacquer is a native varnish, the product of a tree called Tsi-chou, or the lac tree, indigenous to several of the southern provinces of China, and is frequently cultivated. There are three principal kinds of varnish, prepared directly from trees, in China, the names of which are derived from the three cities where they are prepared, and are, in all probability, produced from three different plants. The Nien-tsi is the best, giving to the articles varnished with it a beautiful brilliant black, but it is the least abundant. The Si-tsi resembles the first-named, but is less brilliant and not so dark-coloured; the two are usually mixed together. The third kind, named Kouang-tsi, is of a yellow colour, and is the most abundant and commonly employed. Previous to use the varnishes are evaporated to the proper consistency by exposure in shallow trays to the sun, and then mixed with a certain quantity of Tong-yeou, or tea-oil, obtained from a plant of the same genus as that from which tea is produced. This oil, which in many respects resembles oil of turpentine, is usually prepared by boiling with a little white arsenic, which acts like litharge in giving it drying properties. Another process is to mix it with the dried matter of ox-gall and a little green vitriol or copperas. The Chinese make an imitation of the Japanese varnishes which they call Yang-tsi, which signifies a varnish which comes from beyond the sea, thus showing its origin. This varnish consists of the third variety above mentioned, the Kouang-tsi, mixed with a finely-powdered charcoal of deer-horns and a little of the tea-oil. There are also other varieties of varnish made chiefly with the Kouang-tsi; as, for example, the Tchao-tsi, which is transparent and of a yellow colour, and consists of equal portions of varnish and tea-oil laid on a ground covered with gold dust, mosaic gold, or powdered copper-leaf, usually known as Dutch metal, so as to imitate aventurine. The same effect is produced even still more beautifully by covering the objects with Kin-tsi, and then dusting this varnish over with gold dust, mosaic gold, &c., over which is laid when dry a coating of Tchao-tsi, so that the gold appears between two layers of varnish. Arabesque ornaments and figures in gold leaf are frequently laid on in this way between two layers of varnish. An imitation of this kind of work is sometimes made on English papier-mache, but it appears not to be so perfectly executed as the Oriental. The very usual gold ground,

which has a flame-like appearance, with tints varying from brass yellow to reddish orange, seen on a great variety of japanned ware in Europe, is made in a different way by colouring the under varnish with annatto, dragon's blood and saffron.

Drapery in Painting.

As we are indebted to the antique for the true standard of human form, we also derive from the same source much valuable suggestion as to the shapes and castings of draperies and other elegancies by which costume may adorn the human figure. But in the imitation of these things, particularly in the casting of draperies, we must never lose sight of the differences between painting and sculpture. The close adherence, for instance, of the garment to the limb, showing its form distinctly through it, may be a beauty in sculpture, but unless accounted for by rapid action or the effect of wind, it may become a defect in painting—a defect we more often find in Michel Angelo than in Raphael. Draperies that entirely conceal the figure by their amplitude often impart a grandeur to the most ordinary attitudes. Early Christian sculpture abounds in fine examples of this, as do the works of Giotto, Angelico, Masaccio, and many of the early Italian painters; and more grace may be often added by length of line to attitudes in themselves graceful, as the long riding-habit worn by ladies gives additional elegance to the manner in which they sit on horseback. But in speaking of the composition of drapery we must refer to Raphael as a master beyond most others worthy of study. In his draperies, as in other things, his exquisite taste is always conspicuous. He neither overloads his figures nor are his lines ever poor or meagre. Action is always aided by the streaming or fluttering or slighter movement of the dress, and grace is made more graceful. A previous position of the figure may often be indicated by the manner in which part of the dress lies on the ground or on some other near object, and there are even fanciful modes by which an action may be assisted by drapery. From the shoulders of the visionary figures of St. Peter and St. Paul, in the *Attila*, their mantles are in part detached, so as to suggest wings, and whether this was or was not Raphael's meaning, the effect is a happy one. It may be said of the draperies of Raphael, where the figures are many, that they are sometimes more beautiful in composition, each in itself, than as parts of one great whole, as in the *School of Athens*, while the draperies of Rubens, on the contrary, are often cast more with reference to the general composition than to the individual figure. Indeed, in the compositions of Rubens and of Correggio, the principle of the whole together is never in the least sacrificed to the parts, though the parts often are to the whole.

Mezza-Majolica.

The Arabians and Persians appear to have made articles in earthenware, which they covered with a sort of enamel, that is, glass rendered milky or opaque with oxide of tin, as early as the tenth or eleventh century. The former introduced the art into Europe, and the celebrated palace of the Alhambra, which was commenced about the year 1273 by Mohammed-ben-Alhamar, Moorish king of Granada, had all its walls partially covered and its floors paved with tiles painted and glazed, termed in Spanish *azulejo*, corresponding to the Arabic *zulaj*. Most of the Spanish Moresco buildings were ornamented in the same manner, such as the Cuarto Real, in Granada, the Alcazar of Seville, &c. The Christian Spaniards imitated the Moorish *Azulejos*, long after the destruction of the kingdom of Granada. The more ancient of these tiles of the twelfth and thirteenth centuries appear to have been painted and enamelled on flat or plain surfaces, while the more modern, and especially the Christian ones, were stamped with indented patterns, which were then filled up with various coloured enamels. The colours were chiefly two shades of blue, hence the name *azulejo*, from the same Arabic root as azure, which formed a ground for arabesques in gold. Vases were also made of this kind of ware, and traces of them have been found in those parts of Sicily held by the Moors. The mode of making these enamels spread from Spain into Italy, or in all probability from the Balearic Islands, which belong to Spain, one of which is Majorica or Majorca, of which the word majolica seems to be a corruption. It is probable that a similar invention was arrived at independently by Luca della Robbia, a Florentine sculptor who died at a very early age in 1430, and who, in order to protect his figures, which were formed of calcareous clay and but slightly fired, from the action of the atmosphere, covered them with a true enamel of tin. To this he gave the name of *terra invetriata*. Articles made by him and by his brothers, nephews and grand-nephews, are much sought after by amateurs of the ceramic arts. They are very beautiful and are adorned with bas-reliefs and figures, the chief colours being a pure yellow, an opaque blue, green, and a rather dirty violet. The clay body or *bisque* was of a light yellow colour, which was completely hidden by the milk-white enamel. It would appear that about the same time the

common earthenware or terra-cotta made at Pesaro for domestic purposes was glazed with oxide of lead or litharge, and even with galena (the common ore of lead); either of these substances when spread as a paint on clay and then heated will form a very fusible transparent glass by combining with the elements of the clay. But owing to this transparency the colour of the bisque or body was seen, in order to hide which they dipped the pieces of ware before glazing into a cream or slip of white clay; it was then gently fired and glazed with a varnish of oxide of lead, potash and fine sand calcined together. This is what amateurs call *mezza-majolica*.

Ultramarine.

In many parts of the world, but especially in Siberia, is found a beautiful mineral of a bluish colour, called *lapis lazuli*, from which is prepared the pigment known as ultramarine, so prized by artists. As every part of the stone is not blue, it must be subjected to a series of operations to free it from the uncoloured parts; for this purpose it is broken into pieces the size of a hazel-nut, and is then heated red-hot, and thrown into cold water acidulated with vinegar, an operation which is repeated seven or eight times, until the stone is capable of being reduced easily to a fine powder. This done, the powder is ground upon a stone, with a mixture of honey and a resinous substance used for staining mahogany, called dragon's blood. When sufficiently ground it is dried, after which it is worked up with a mixture of Venice turpentine, rosin, pitch, bees-wax and linseed oil, placed in a cloth and kneaded in pure water; the ultramarine thereby is separated, the sand and other impurities remaining in the waxy mass. This operation is sometimes repeated where it is desirable to obtain the pigment of very superior quality. The price of true ultramarine varies with its quality from about 3*l.* to 8*l.*, or even 10*l.* per ounce. This extremely high price naturally led persons to attempt to produce it artificially, especially after Clement and Desormes had shown that its composition was very simple, being, in fact, principally composed of silica, alumina, soda and sulphur—substances which would be represented by pipe-clay, common carbonate of soda, and flowers of sulphur. This was effected in 1824 by M. Guimet, of Paris. Others have, however, also solved the problem, among whom we may mention Robiquet and Professor Gmelin, of Tübingen. The process of the former consisted in heating in a closed vessel a mixture of two parts of china clay, three of sulphur, and three of dried carbonate of soda; the resulting spongy mass, when cold, was of a greyish green colour, and was reduced to powder and washed with water, under the influence of which, and of the air, it becomes gradually of an azure blue. When sufficiently washed it is again ignited, to drive off any excess of sulphur. A great many other processes have been proposed and a number of factories established in different parts of Europe, where immense quantities of it are manufactured, the price falling in proportion. When first made M. Guimet charged 1*l.* per ounce for it, but at present a pound weight of it may be obtained for a much less sum.

Eton, and King's College, Cambridge.

One of the first acts of the ill-fated Henry VI. after he had taken the government into his own hands was the foundation of two magnificent colleges, at Cambridge and at Eton. His principal counsellor with whom these beneficial plans were concerted was William of Waynflete, whom he made provost of Eton, and who lived to be himself the founder of Magdalen College, in Oxford. In the twenty-second and the following year of his reign and the same of his age, the king charged the Duchy of Lancaster, which he considered as his paternal estate, at that time amounting to 3,395*l.* 11*s.* 7*d.* per annum, with an annual payment of 2,000*l.* toward the erection of his two colleges, and he confirmed his donation in his will (dated March 12, 1447), to be continued for twenty years. Eton was designed to be "replenished with goodly windowes and vaults, laying apart superfluities of two great curious workes of entaile and busy mouldinge." A cloister 200 feet by 160, and a tower 20 feet in diameter within the walls and 140 feet in height, were described in the plan. Such was the intended magnificence, but it partook of its founder's fate, and was never completed. King's College has likewise failed of its original plan, which is recited in the will of Henry VI. The chapel was to contain "288 feet of assize in length, without any yles, and all of the breadth of 40 feet; the walls to be in height 90 feet, embattled, vaulted and chare-roffed (having a space between vaulting and roof), sufficiently boterassed, and every butterace fined with finials, and betwixt every butterace a window of five bays, and on both sides a closet with an altar therein, containing in length 20 feet and in breadth 10, vaulted and finished under the soyle of the yle windowes." The cloister to be 175 feet by 200, a tower of 24 feet diameter and 120 to the corbel table; and another tower for a gatehouse 30 feet by 22 and 60 in height. The whole premises to be surrounded by a wall 14 feet high, embattled and fortified with towers, as many as may be thought

convenient thereto, "with a large tower towards the High Street and another in the middle of the west end of the new bridge." King Henry's successors of the House of York appear to have been not inattentive to his great work at Cambridge, which had made but a slow progress during his unfortunate reign. It is said that the walls of the chapel had not risen many feet above their foundations at the time of his death. Yet the sums given towards the carrying on of the building were either so sparingly or so irregularly bestowed by Edward IV. and Richard III. that the roof, external ornaments, turrets, pinnacles, vaulting the small oratories and glazing, remained to be finished by Henry VII. Although engaged during the whole of his reign in magnificent architectural works, both at Windsor and Westminster, he certainly did not neglect King's College, and made an ample provision in his will, by which that highly celebrated structure was completed under the care of his executors early in the reign of Henry VIII. A more commanding elevation than that of this chapel, seen from the senate-house, will not be found in any other part of the English dominions. Being a mass, the height of which is sufficient to relieve its great length, it instantly communicates an idea of Gothic grandeur, almost without parallel. But it may be questioned whether the oratories, which have the external appearance of a cloister, do not materially break the general effect of the buttresses and angular turrets, which would have been still more striking could they have been viewed from the foundation to the summit without any interruption.

Varieties of Clay.

When clays are formed from granite rocks they are usually white or yellowish-white, and are very adhesive or plastic; when resulting from the decomposition of slaty rocks they are more or less coloured and sandy, and when limestone mud gets intermingled their plasticity is greatly diminished. The plastic element consists of some combination of silica (quartz or flint in a peculiar condition) and alumina (one of the constituents of alum), with more or less water; but a perfectly pure combination of this kind rarely occurs in nature, there being always present various quantities of sand, iron, lime, magnesia, potash, &c. The less of these substances present the richer or fatter the clay, whilst clay containing a great deal is called poor. These substances not only exert an influence upon the plasticity of a clay, but also upon its relation to fire; the nearer a clay is in composition to a pure silicate of alumina, and the more silica it contains, the more infusible it is, but an admixture of iron or lime will give it the character possessed by a mixture for making bottle-glass, for when subjected to a heat depending upon the amount of these foreign substances it will melt. The finer clays, or such as are infusible and white, are very rare, while those which contain lime, such as ordinary clay marls, and those rich in iron, such as brick clays, are common. A clay may contain so very little foreign substances as to be infusible, and yet have sufficient iron to give it a colour; for we may remark here that the colour which a clay assumes on being burned depends upon the iron which it contains. The fine white clays (*kaolin*) are used in the manufacture of porcelain and are found usually in granitic countries; the inferior white clays (pipe-clay) are usually found in coal districts and are used in the manufacture of earthenware and pipes; at present we shall confine ourselves to the coloured clays. These we may conveniently divide into the infusible or fire-clays, which burn either of a buff or of a dark colour, and the fusible or ordinary brick clays, which burn of various colours, especially of a pale yellow and bright red. The fireclays are chiefly obtained from beds associated with coal, very frequently forming the underlying stratum, and hence called coal-seat, though they are also found under many other circumstances, and even on the surface. They are generally of a bluish-black colour and of a hard slaty texture, a good example of which is afforded by the well-known Stourbridge clay. The fusible clays are derived from various sources, but are very often superficial deposits, constituting the subsoils of large tracts of country. They usually contain a certain amount of carbonate of lime, and in some cases so much as to be true marls. They also frequently contain some sand and pebbles; when, however, the proportion of sand amounts to one-fourth of the entire mass it is not considered as clay in the strict sense of the word, although that substance may be separated from it by washing. Indeed, there are few loose superficial deposits, such as soils and subsoils, that could not be thus made to yield clay. The economical uses of the fireclays are chiefly for the manufacture of brick destined to withstand great heat, the construction of furnaces of various kinds, pots for fusing glass, retorts, &c. The fusible or common clays constitute the materials from which our usual building bricks, roofing and flooring tiles, draining pipes, garden pots, common pottery are made. Both kinds are employed in the production of figures and ornaments in what is called terra-cotta.

NOTES AND COMMENTS.

It is commonly supposed that the proposal to decorate St. Paul's Cathedral which caused surprise about a century ago originated with REYNOLDS and other Academicians. But from the following paragraph which appeared in the newspapers in September, 1773, it would appear the initiative arose with the cathedral authorities:—"The Dean and Chapter of St. Paul's, encouraged by the rapid progress of the fine arts in this kingdom, are come to a resolution of decorating the inside of that cathedral with paintings and such other ornaments as are necessary to complete the original design of the architect, which will make that structure one of the finest in the world. For this purpose they have lately applied to the Royal Academy for its superintendence and support; and on Saturday last the Academy appointed six of its most distinguished artists to carry into execution this great design. The following are their names:—Mrs. ANGELICA KAUFFMAN, Sir JOSHUA REYNOLDS, Signor CIPRIANI, Mr. WEST, Mr. DANCE, Mr. BARRY." Owing to the opposition of the Bishop of LONDON the arrangements were fruitless, and perhaps it was as well, for the figures of Mrs. KAUFFMAN, CIPRIANI and DANCE at least would not be in keeping with WREN's work.

An examination takes place every summer in the Louvre to which the public in general and foreign visitors are indifferent, but the results are often awaited with painful anxiety. Every one knows how numerous are the copyists, many of whom appear to be interminably engaged on favourite pictures without coming to an end. In France every kind of art must receive more or less official patronage or there would be an outcry about the narrow-mindedness of the Government. Copying of Louvre pictures is not excluded. Accordingly, once a year some of the conservators of the public galleries, with a few representatives of the Fine Art Commission, have to undertake an examination of the copyists' attempts. The purchasing powers are strictly limited. About fifteen copies are to be selected, and the highest price for any one must not exceed 1,000 francs. For the majority the sum paid is far lower. But even a few francs may be a godsend to some of the poor artists, and besides there is the gratification of feeling that their works are worthy of being placed among the national treasures. What becomes of the copies nobody inquires. They are sent to the remote galleries in the provinces, but they are rarely seen unless when it is necessary to remove a picture for cleaning or other purpose, and a copy of a great master is used to fill the empty space.

THE old engineer, Herr BAENSCH, will be the observed of all observers at the opening of the North Sea Canal. He is a type of the Prussian specialist official, who is a very different man to the Government civil engineer of England, who is so often little more than an ornamental appendage. Herr BAENSCH, who was born in 1825, in his twenty-first year left the Berlin Academy of Construction, and entered the public service as inspector of land and water works. After some experience in office he began anew studies in iron construction, and was employed in carrying out countless railway bridges, stations and workshops. But when the north coast of Prussia was being wasted by the sea, Herr BAENSCH was despatched to report on measures of safety. His recommendations, which appeared in book form, gained deserved attention. He was appointed director of harbour and canal works, and the improvement of the Rhine was also placed in his hands. When it was decided to undertake the Ship Canal it was considered there was no engineer more competent to direct the operations, and he has had the good fortune to bring them to completion. Herr BAENSCH won his way by ability and industry, and he merits any honours which the Emperor of GERMANY can confer on him.

THE proposed metamorphosis of a part of the Champs-Élysées, in order that the scheme for the International Exhibition of 1900 may be realised, has been discussed at a meeting of the Commissioners. The first question,

whether the existing Palais de l'Industrie, in which the Salon and other exhibitions are held, should be demolished, was decided in the affirmative. The next question was whether new buildings adapted to the requirements of 1900 should be erected or the site be converted into plantations and gardens. Almost unanimously it was resolved to erect buildings of an equivalent area. The associations will therefore not be broken, for the visitors to the exhibition who are acquainted with Paris can seek works of art in the part of the Champs-Élysées where pictures and statues have been seen for several years. It was also arranged that the bridge which is to be erected across the Seine will not be more than 160 feet in width instead of 200 feet. It is intended to raise the 100,000,000 frs. which will be requisite for the works mainly by a novel financial combination, and so long as an addition to taxation is not contemplated, the Government will hardly oppose any project adopted by the Commission. But whatever is arranged the city of Paris will have to contribute one-fifth of the sum required. That appears to be a preliminary condition.

SPLITS in societies of artists are not without advantage. In Paris, since a rival exhibition was set up in the Champ de Mars, English pictures are welcomed, and, instead of a certainty of rejection at the Salon, an English painter can enjoy the privilege of speculating about the gallery which he will condescend to patronise. In Munich there is a similar competition for foreign works. At least one-half of the pictures in the exhibition of the "Secessionists," which was opened last week, were painted outside Germany. Scotsmen are not slow to take advantage of an opportunity, and about twenty of the Glasgow artists are represented. Works are also accepted from Dutchmen and Frenchmen, and in a short time we may expect to find every exhibition in a foreign city is of an international character. Whether British painters can compete with Germans in price is doubtful, and, if pictures are not sold, where is the advantage of exhibiting them?

EXAMPLES of students' works of various classes produced in the Glasgow School of Art were lately sent to an exhibition in Liège. From a letter by M. SERRURIER, the president of the committee, it would appear that the excellence of the examples surprised the Belgians. In the course of it he says:—"Our schools of art are far—very far indeed—from being so advanced as yours, and what has above all astonished us in your work is the great liberty left to the pupils to follow their own individuality. Such is so different from the ideas current in our schools of art that it is difficult for us to comprehend this freedom, although we admire it very much. I think the exhibition of the works of your students cannot but cause serious thought and reflection to those here who direct art instruction." The testimony is the more satisfactory, as at one time the Belgian schools were held up as models which could not be too closely followed.

A CATALOGUE has been issued of the books in the library of the Architectural Association. It is too commonly supposed that the collection consists mainly of elementary treatises. But a glance at the pages will show that while books of that class are provided, there is an abundance of advanced works, and among these are many which can be considered as classics. The catalogue is arranged under two divisions, viz. authors' names and subjects. As the pages are only printed on one side, there is space for notes or records of additions. The volume will be found useful by the members.

OLD English and Continental pewter forms the subject of a handbook which is being prepared by Mr. E. GUY DAWBER and Mr. LANGTON DENNIS, 22 Buckingham Street, Adelphi. They will be very glad to receive any information concerning fine specimens of pewter, especially such as are in private collections. Rubbings of marks would be also welcome.

THE CHAMPION ATHLETE.

WE have no phrase in English which is equivalent to the Roman "panem et circences." "Beer and skittles" no longer expresses a working man's ideal, for it suggests exertion to which he is not disposed. "Lords and ices" or "Bread and cheese and the Oval" would not be an attractive cry to the most eager lovers of "the game" in Middlesex or Surrey. But the circus meant all things to a Roman, and to gratify his weakness for it he was willing to live on meagre fare. The most austere could there see manly exercises which recalled old times, and the degenerated race who had become bored with most things felt their blood slightly moved at the contests of Gauls and Britons, who were "butchered to make a Roman holiday." The fierce invectives of JUVENAL reveal how many evils were produced by the passion for scenes in the amphitheatre. His pictures of life, although overspread with a lurid light which in the eyes of the humblest Greek versifier would be contrary to all art, display to us how fate was preparing the city for a conquest by the northern hordes through the disorganisation which arose out of the arena. Yet JUVENAL himself was forced to confess that he was not exempt from the infatuation which was leading his fellow Romans to destruction. In his third satire he relates how one of his old friends, apparently a poet, who also belonged to Aquinum, left Rome because it no longer offered any refuge to the liberal arts. The great men of the city, said the friend, were vagabonds, strolling musicians and mummers. They pandered to the worst passions, for when in office they made the contests between men more cruel; at the least sign of approval a wounded gladiator was slain. At the bottom of all were the Greeks, whose subtlety, impudence and persuasiveness fitted them for underhand dealings. "Do you know what is a Greek?" asked JUVENAL's friend, and he answered his own question by saying a Greek is a grammarian, rhetorician, geometrician, painter, shampooer, augur, acrobat, physician, magician; in fact, an universal man. Order a Greek to ascend to Olympus, and if he is hungry he will find a way there. In the baths and the gymnasia, as elsewhere they were doing mischief which culminated in the circus. Many of the old school of Romans must have joined in that belief. The friend begged JUVENAL to return with him to Aquinum, where, amidst pure air and pleasing fields, they could compose satires in partnership and scourge the prevailing vices. But JUVENAL would not withdraw from the circus and its games. There he saw all that was evil in contemporary life, and we suppose he felt that there was little difference between himself and the sinners around him. Omit from his satires whatever relates directly and indirectly to the circus, and one of the motive powers of the Roman decadence there described will be wanting.

It is not to be supposed that the decline and fall of the Roman Empire was caused by people spending too much time in athletic exercises. "Very few among us," exclaimed JUVENAL, "engage in active exercises, or eat of the food (*coliphia*) of the athletes." Manly exercises were performed by deputies, and in course of time the defence of the empire was supposed to be attainable with as much ease. Sometimes a vigorous gentleman would compete in one of the contests. But if he displayed any skill he was likely to be looked on as dangerous, and doomed to be a victim of whatever tyrant was in power. "To be noble and old in Rome," says JUVENAL, "is to be a prodigy, and has been so for many years; it is preferable to be the meanest on earth than the son of a man who has gained respect." Then there were expenses which were ruinous. The circus was a free entertainment, but men and women can never congregate in public places without competing in the display of costliness. The Colosseum was as advantageous for the foreign milliners of Rome as Ascot or Goodwood is for those of London. To what extremes people were brought is suggested by one of JUVENAL's miniature sketches. He represents a lady he calls OGULNIA as deprived of fortune; nevertheless it was necessary for her to hire robes, tall slaves, followers, a litter, cushions, friends, a duenna, and a blond young girl to deliver messages, in order to appear in a becoming manner at the

circus. She might be the grand dame introduced in M. LEVY's painting. The remains of the family plate were sacrificed by her as presents to the athletes in order that she might appear like other women, many of whom, says the poet, do not hesitate to allow hunger to enter their houses rather than sacrifice anything that is supposed to be necessary in those appearances before the public. But more pernicious than any outlay on personal adornment was the law by which only men who were possessed of a prescribed sum were allowed to enter certain parts of the amphitheatre. That gave a new impetus to the pursuit of wealth by which the Romans became still more regardless of the sufferings of others, and it was the cause of many crimes.

M. EMILE LEVY, in his *Mela Sudans*, which we illustrate, does not enter into competition with M. GÉRÔME in depicting the excitement of a gladiatorial combat within the Colosseum. He is content with giving a suggestion of a scene which might have arisen in one of the dependencies of the amphitheatre where the athletes received the final touches of grooming. Roman contests are too commonly supposed to have been all fought by retiarii, secutores, mirmillones, threces, or other variety of gladiators. There were also competitions between professional runners, wrestlers, boxers, and apparently combined exercises of various kinds. It is not, however, possible to discriminate between Greek and Roman practice. We may suppose that the Greeks were as likely to be utilised in training as in the arts, and the system which was adopted in the Olympian and other contests was probably repeated in Rome.

The favourite to whom so many eyes are turned in M. EMILE LEVY's painting looks as if he were trained to take part in more than one competition. Old and young, women as well as men, behold him with approval. The patrician in the embroidered toga (which at one time was sacred to warriors who were granted a triumph) evidently considers he is to be envied for his acquaintance with such an athlete, while the backer or trainer on the other side of the hero is manifestly nervous that with so much adulation his instructions may be forgotten. The struggle between the two boys would suggest that a wrestling match will begin the contest. The other athletes are of little account; one alone has secured all sympathies. M. EMILE LEVY affords us a glimpse of ancient Roman life, a peep, as it were, behind the scenes of public entertainments, for which he could have no authority in any ancient author, but which is likely to be true, for it is an inference from the discoveries and speculations of later archæologists.

DETAIL OF ARCHWAY, TEMPLE GARDENS.

DHO FAR AND THE FRANKINCENSE COUNTRY.

AT the meeting of the Geographical Society on the 6th inst. a paper was read by Mr. J. Theodore Bent on his travels in Southern Arabia. In the course of it he said that Dhofar, the ancient frankincense country, at which point the party elected to commence their winter's campaign, is 640 miles by sea from Muscat. They reached it by steamer. Dhofar is nominally under the Sultan of Muscat; its ruler is Wali Suleiman, a man of remarkable strength of character and determination, who has 12,000 Bedouins devoted to him. He related with pride that two years ago he had sent 2,000 rupees as tribute to Muscat, last year he had only sent 1,000, and this year he had sent none. His next step will probably be, when a favourable opportunity offers, to declare himself independent under British protection. For this reason he was exceedingly polite to the travellers, entertained them in his palace by the coast at Al Hafa, and arranged with the greatest possible assiduity for their safety during the exploration of the interior. Dhofar and the Gara mountains, which encircle it, form a quite abnormal feature in this otherwise arid coast. From Cape or Ras Risout in the west to Merbat on the east there is a long narrow stretch of flat alluvial soil at the foot of the mountains, very little raised above the level of the sea. This plain is never more than nine miles wide, and at the eastern end, where the mountains come down nearer to the sea, it is reduced to an exceedingly narrow strip. The plain is very fertile, and

capable of producing almost anything. Along the whole line are many groves of coconut palms. Tobacco, cotton, Indian corn and various species of grain grow in great abundance; in the gardens are many of the products of India flourishing, namely, the plantain, the papaya, mulberries, melons, chilis, brignoles and fruits and vegetables of various descriptions. In fact, Dhofar and the Gara mountains may be termed one large oasis by the sea, bounded on the north by the Nejd desert, on the east by the Oman desert, and the gradual tendency to the west is towards the arid hills and sand-choked valleys which were met in the Hadramout last year. The Gara mountains are full of water forming itself here and there into small lakes. They are decked to their summits with rich vegetation, and this will account for the fertility of the plain of Dhofar. The one drawback to the progress of this country is its harbourless condition. During the north-east monsoons dhows can find shelter at Merbat, and during the south-west monsoons at Risout, but the rest of the coast-line is provided with nothing but open roadsteads with a rough surf always rolling in from the Indian Ocean. The party traversed the whole of this plain between Capes Risout and Merbat in various directions, and found thereon the sites of ruined towns of considerable extent in no less than seven different points, though at the two capes where now is the only anchorage there are no ruins to be seen, proving that anchorage of a superior nature existed here in antiquity, and which has since become silted up, but which anciently must have afforded ample protection for the boats which came here in the frankincense trade. At Takha there was a very extensive and deep harbour, running a considerable distance inland, which with a little outlay of capital could easily be restored. After a close examination of these ruined sites there can be no doubt that those at a spot called now Al Balad and Robat, about two miles east of the Wali's residence, formed the ancient capital of this district. The travellers visited them last Christmas Day and were much struck with their extent. The chief ruins are by the sea, around an acropolis some 100 feet in height. This part of the town was encircled by a moat still full of water, and in the centre, still connected with the sea, but almost silted up, is a tiny harbour. The ground is covered with the remains of Mohammedan mosques and still more ancient Sabæan temples, the architecture of which—namely, the square columns with flutings at the four corners and the step-like capitals—at once connects them architecturally with the columns at Adulis on the Red Sea, those of Koloe and Aksum in Abyssinia, and those described by M. Arnaud at Mariaba in Yemen. In some cases these are elaborately decorated with intricate patterns, one of which is formed by the old Sabæan letters Θ and X, which may possibly have some religious import. This town by the sea is connected by a series of ruins with another town two miles inland, now called Robat, where the ground for many acres is covered with ancient remains; big cisterns and water-courses are here cut in the rock, and standing columns of the same architectural features are seen in every direction. With the aid of Sprenger's "Alte Geographie Arabiens," the best guide-book the traveller can take into this country, there is no difficulty in identifying this ancient capital of the frankincense country as the *Μαυρείον Ἀπρέιδος* of Claudius Ptolemy. This name is obviously a Greek translation of the Sabæan for some well-known oracle which anciently existed here, not far, as Ptolemy himself tells us, from Cape Risout. This name eventually became Zufar, from which the modern name of Dhofar is evidently derived. In A.D. 618 this town was destroyed and Mamsura built, under which name the capital was known in early Mohammedan times. Various Arab geographers also assist us in this identification. Yakut, for example, tells us how the Prince of Zufar had the monopoly of the frankincense trade, and punished with death any infringement of it. Ibn Batuta says that "half a day's journey east of Mamsura is Alahkaf, the abode of the Addites," probably referring to the site of the oracle and the last stronghold of the ancient cult. Mr. Bent proceeded to show that having assured himself of the locality of the ancient capital of the frankincense country—for no other site along the plain had ruins which would at all compare in extent and appearance with those of Al Balad—other sites fell easily into their proper places, and that thus an important verification of ancient geography and an old-world centre of commerce had been obtained. He next described his visit, under the auspices of the Gara tribe, to the confines of the Nejd desert. He had never had to deal with wilder men in his life than those who constituted the escort; they wore long unkempt hair, tied down with a leather thong like a bootlace. Each man carried his wooden shield, called a gohb, so constructed with an iron knob that he could turn it round and use it as a stool to sit upon; his wooden spear pointed at both ends, called ghatrif, a weapon peculiar to the Gara tribe, which they hurl with wonderful precision, and his flat iron sword called saif. Very few also carried matchlock-guns. These wild men were in most respects friendly, but of a most independent spirit. If asked to do anything for the travellers, they would reply, "We are sheikhs,

not slaves." They affected indifference for money, and absolutely the only hold the explorers had over them was medicine. They positively loved Mr. Bent's medicine-chest and during the journey consumed an incredible quantity of pills, quinine and other dainties. At first they would chew the pills, with disastrous results, but were soon taught to swallow them in the orthodox fashion. Every night there was a row of them wanting to be doctored, and with this feeble weapon Mr. Bent ruled. They took the visitors to see everything in their country. In type they are akin to the Hadramout Bedouin, small, active, and with finely cut features, but they are much wilder and less accustomed to contact with civilisation. They live chiefly in caves and under trees, only using reed huts when they come down to the plain to encamp with their flocks during the rains. Near Cape Risout a large tract of country is covered with frankincense trees, with their bright green leaves like ash trees, their small green flowers, and their insignificant fruit. The frankincense, the old staple trade of this district, is still gathered in three places in the Gara mountains. The best is obtained at spots called Hoyé and Haski, about four days' journey inland from Merbat, where the Gara mountains slope down into the Nejd desert. This quality they call leban lakt, and altogether about 9,000 cwt. is exported yearly and sent to Bombay. It is only collected in the hot weather before the rains begin, in the months of March, April and May, for during the rains the tracks on the Gara mountains are impassable. They cut the stem, and after seven days' return to collect the gum which has exuded; this they do three or four times a month, and in the cool weather, as the gum comes but slowly, they leave the trees alone. The trees belong to the various families of the Gara tribe; each tree is marked and known to its owner, and the product is sold wholesale to banyan merchants, who come to Dhofar just before the monsoons to take it away. Some wonderful scenery, including that of the gorge of Ghersid, was next passed in review. Here the sweet-scented white jessamine hung in garlands from the trees, and the air was fragrant with the odour of many flowers; above towered grey rocks, and the hill slopes were clad on both sides with trees. The highest point of this range of mountains is not more than 3,000 feet, and at the camp that night the explorer registered 2,600 feet. He found the Gara women exceedingly shy and retiring; they fled, if approached, like timid gazelles. They have but poor jewellery—silver necklaces, armlets, and nose and toe rings; they love to join their eyebrows with antimony, and stick some black sticky stuff like cobbler's wax over their noses and foreheads; they are very small, and like Japanese; they do not cover their faces, and are very lightly clad in dark blue homespun cotton garments. Mr. Bent went on to describe a remarkable cave just above the plain, and only about ten or twelve miles from Al Hafa. This cave burrows far into the mountain side, and is curiously hung with stalactites, and contains the deserted huts of a Bedouin village. Immediately below this cave in the Wadi Nefas are the ruins of an extensive Sabæan town, in the centre of which is a natural hole 150 feet deep and about 50 in diameter. Around this hole are the remains of walls and the columns of a large entrance gate. He asked for information about this place, but all he could get in reply was that it was the well of the Addites, the name always associated with the ruins of the bygone race. In his opinion this spot is the site of the oracle mentioned by Ptolemy and others from which the capital of Dhofar took its name. It exactly resembled the deep natural holes that they had found in Cilicia, in Asia Minor, where the oracles of the Corycian and Olbian Zeus were situated. Perhaps an enterprising archaeologist might hereafter be able to open the ruins about here and find the identification from epigraphical evidence. At Takha he found extensive remains of an ancient town, which must have been second only in importance to the capital at Al Balad. The ruins were exactly as Yakut says, five parasangs, or twenty miles, west of those of Zufar at Al Balad, and as there were none at the modern town of Mirbat, and only indifferent anchorage during the north-west monsoons, it would suggest itself that the Mirbat of antiquity was situated here. On the following day this somewhat puzzling question was settled for the explorer by finding the only thing wanted to identify the spot, namely, a commodious harbour. An hour's walk from the camp near Takha took the party across a promontory where the estuary of a river formed quite a large lake, separated from the sea only by a narrow sand belt, over which the water flowed at high tide. Around this lake were the ruins of several ancient buildings, and what was now a headland connected to the mainland by a neck of sand was surrounded by an ancient wall and fortification, and bore the appearance of having once been an island protecting the entrance to a harbour. Here they had the one thing wanting to identify the site, namely, the harbour to which Yakut referred, where the ships which came to Dhofar in the frankincense trade found anchorage. The Abyssapolis of Ptolemy, like *Μαυρείον Ἀπρέιδος*, was evidently the Greek equivalent for some Sabæan name, or merely called from the existence near

this spot of a remarkable abyss, standing there still as one of the world's wonders, constructed by nature on the same principle as the Pink and Yellow Falls in New Zealand and the calcareous deposits of Yellowstone Park. He concluded by narrating some curious local customs, and by expressing an opinion that the Bedouins of the Gara tribe speak a distinct and separate language, and not a dialect of Arabic, as in the Hadramout. So far as this year was concerned, the further survey of the Hadramout had to be abandoned. His original plan was to go up the Wadi Mosila, which is said to contain many interesting sites of ancient towns, to cross over the tableland again east of the hostile Katiri tribe, visit the tomb of the prophet Hud, the Mecca of this portion of Arabia, and the volcano of Bis Barhut, which had been described to him as a large hole in the mountain side, out of which issue volumes of smoke; it was similarly described by the old Arab geographers such as Hamdani, Idrisi and others, and was the place described in the Koran as the abode of infidel souls after death. This neighbourhood should be replete with natural and historical interest, and Mr. Bent hopes that, with adequate support from the Aden Government, he may be able to reach it another year.

ARTISTIC DOMESTIC ARCHITECTURE IN AMERICA.*

THE development of artistic architecture in America began after the Philadelphia Centennial. Good architecture of a certain class we had before that time it is true, but that exhibition pointed the way to culture that speedily penetrated all forms of art and of industry. The general movement toward higher artistic ideals inaugurated by the Centennial soon found expression in architecture. The present revival of the art—for notwithstanding many depressing manifestations we are living in a time of vast architectural interest if not strict revival—is not to be attributed solely to the action of the impulses started by the Philadelphia exhibition. The educated architect, trained especially for his profession and in a professional manner, is scarcely older in this country than that time. Not that all our present architects are the young men this statement would seem to imply, but the road to the practice of architecture is now almost wholly through the schools for preliminary study, or through the practical work of a trained architect's office; the result is much the same whether the preliminary schooling is had or not. The road through the carpenter's shop and the work bench, which in the past produced some faithful men, but few artists, has been closed for all time. The present revival has accomplished that if it has failed in other things.

The training of architects and the spread of artistic culture have gone hand in hand. Guided by the one, inspired by the other, people to whom the very word architecture was long unfamiliar now profess a more or less general acquaintance with the art, and when they build insist on structures of a certain standard of artistic excellence, depending for the most part on the ability of the architect whom they employ and on the taste, if not on the accuracy, of their own judgment. There is still a vast deal to be done. People of the broadest culture, of refined temperaments, are still paying for the erection of the most inartistic structures, and architects without the smallest artistic quality are still commanding lucrative practices. In a genuinely artistic age such things would be impossible. It is a significant indication of our own position in history that we can tolerate them and calmly rank them among the peculiarities if not the glories of our civilisation.

The severest of the critics must admit the general spread of the artistic quality in American architecture. The days of bad things are not yet over, but they are rapidly diminishing. Important and costly work is generally placed in competent hands, though the structure of our architectural economy is such that the master of the country house is supposed to be likewise master of the high commercial building. But radical reforms work slowly, and we must take architecture as it is if we would understand its present status, and not as it ought to be. For it is easy enough to tell how it ought to be, but it is a very different matter to analyse it and estimate it at its present and actual worth.

Modern American architecture is more complicated and diffuse than the architecture of any contemporary nation or of any past epoch. Our buildings are more varied, our conditions more complex, our needs more numerous, our materials more diverse, our resources more abundant, and our artistic qualities and appreciation less acutely developed than with any other people or in any other time. With all these complexities we have the additional disadvantage of having no style of our own, but of being free to choose where we will or where temporary fashion may dictate. Our architecture necessarily

reflects these complexities and is quite as confused and as indiscriminate in its growth, its development and its work as such multifarious conditions would suggest. The difficulties in the way of artistic work are, therefore, enormously enhanced by the conditions, by the vagaries of architects and of clients, the inclinations of the one, the ignorance of the other, the persistence with which each will seek to find the mote in the other's eye while oblivious of the beam in his own; and yet in the face of such adverse circumstances the last few years have seen a steady progress in the artistic development of American architecture, a constant growth in the materials used by the architect and in the standard of appreciation manifested by the client and the public at large. Good buildings are no longer scarce, though not so plentiful as one could wish; bad buildings are diminishing in number, though every now and then the most preposterous work will be produced by the most capable hands under conditions entirely favourable for good. The psychologist may still find material for experiment and philosophising in the architecture of the present day if he will but turn his mind to it.

The artistic quality in American architecture may be viewed generally as a whole, or with reference to the individual claims of some few architects to be considered artists. The use of the word artist in this connection is not the same as when applied to the painter and the sculptor. The architect, even in his most artistic moods, cannot be a free untrammelled artist as the painter may. His art is limited by harsh conditions, he has to do with unyielding materials and with circumstances and requirements over which he has no control, and which often enough prevent his giving even an artistic form to his building. But the true artist-architect, if I may use so barbarous a combination, will always leave the impress of his art upon whatever structure he undertakes. It may be seen in the detail, in the use of ornament, in the general arrangement and in the plan, even though the final completed effect falls short of what he himself would wish it to be. A master of the art of architecture must always be a master. His work is permanent and enduring and may be seen of all men. His responsibility is thus greater than his brother artists in painting and sculpture, whose works may perchance be destroyed, while his own remains to tell future generations of his work—perhaps of his failures.

Of the artistic architect we have but a few, perhaps no more than can be counted on the fingers, perhaps no more than can be counted on those of one hand. But we are no worse off than other nations in this respect, for architecture is so largely a matter of business and of management, and success in it so often dependent on everything but artistic skill, that the truly artistic architect can only be a rarity even under the most favourable circumstances. And then there is the extraordinary fact that the best of architects, the men whose names are most familiar to the world, whose work is most in evidence and who have the most work to do and the most important, are constantly doing the things they ought not to do, and that in the most extraordinary fashion. But we have architecture in America that is not wholly the product of the artist-architect, work very good in itself, admirably suited for the purposes for which it is intended and dowered with a grace and beauty that lift it above the ordinary, though its creators may not all of them be properly called artists in the truest sense. It is this ability of so many of our architects to produce interesting buildings which renders the outlook so hopeful and which makes American architecture in its best forms—and this, it should be remembered, is the latest—among the most interesting now to be found anywhere.

This artistic quality is manifested in many ways, but in none is it more abundantly seen than in the country house. American architects, with but one or two exceptions, have not yet accomplished the solution of commercial and business problems in an artistic manner; even the town house, when confined to the narrow limits of city lots, is not always the work of art it ought to be. Many of our churches are well done, and some of the other buildings, but in country houses very great excellence, if not absolute superiority, is universally conceded to the American. Here opportunities for individual work have been most frequent. The architect has not been restricted by the awkward conditions that limit his work in the city, and it is to this freedom from restraint that the success of the American country house is chiefly due.

The country house has an environment that invites artistic treatment and largely supplements it. The problems it presents are simple, yet of infinite variety, and the demand for buildings of this class has come primarily from well-to-do and cultured people who wished their houses to reflect their own culture, and to partake of that artistic feeling that has crept into so many elements of our life. The country house is made to order; it is not built in rows wholesale. Opportunities for speculative building have not been so frequent as in the cities, where it has well-nigh stifled individualism in house architecture. Everything favoured a new departure in architecture, and about the time that the artistic movement set in the country house people

* From a paper by Mr. Barr Ferree in the *New England Magazine* for June. (W. F. Kellogg, Boston.)

began to realise that the joys of living were not all to be found in the narrow, crowded limits of the city. The suburban town began to boom, and with it arose fresh opportunities for the architect. Country seats on a new scale began to develop, and those who already possessed houses in the country started in to make improvements and changes which not only resulted, often in a complete metamorphosis of the old building, but which at the same time conformed to this new feature of country living. Our cities, in their turn, spread out further into the country. The suburban and the semi-detached house felt the change, and new fields were opened up that our architects have been swift to fill with their best work.

The movement began with the picturesque, which is quite distinct from the artistic, though sometimes confounded with it. The picturesque is the preliminary stage, the artistic the epoch of full development. Moreover, a thing may be picturesque without possessing any artistic quality. Still it was a preparation for the artistic that we needed; and while we have not yet wholly passed it—for every day new work may be seen that is better described as picturesque than artistic—we should not be hasty in condemning it. Its most conspicuous influence has been the development of a sort of rococo period of roofs, dormers and turrets, grouped more or less effectively, but sometimes with such results that nothing save the roof is visible, the house being so buried in its covering as to be quite insignificant. Multitudes of such designs have been made, multitudes of such houses built, and doubtless multitudes of people live in them, though it would certainly seem that outside the tropics, where such styles of dwellings are exceedingly fashionable, humanity needed more than a roof to be comfortable.

But that composition in roofing, in gables, in chimneys, in dormers and in what not has been carried to excess is, perhaps, an indication of healthy interest rather than a sign of decay. It is a great thing when people whose occupation in life is not concerned with architecture can differentiate between different sorts of roofs, and grasp the effect of a chimney carried up on the outside of a house. It is not a great artistic advance, perhaps; but the moment people begin to think about the art of their houses a long step forward has been made. At all events the feeling that helped overdo this useful member in the modern house—reverting once more to the roof—produced, in more capable hands, the finer artistic qualities in which the real strength of American country house architecture unquestionably rests.

And this artistic element is, first of all, an artistic appreciation of composition, of massing, of arrangement, of outline, of grouping of parts, of subordination of detail, of careful scrutiny of the whole work. It has been the obtaining of effects in architecture by architecture itself, without dependence on ornament or decoration or other accessory parts on which American architects, and many architects not Americans, too much depended in the past, and on which they still depend in certain classes of buildings. The substitution of building for ornament, of architecture for decoration, of mass for detail, amounts to nothing less than a return to the first principles of architecture, and the extraordinarily interesting results obtained under it, often artistic, frequently beautiful, are the greatest triumphs American architecture as a whole has yet obtained. That is, speaking from the artistic standpoint; for American architecture has made wondrous sanitary and hygienic advances in the last few years, which for general good to the human race quite outweigh artistic detail. This, however, is another story; but it is well to remember that while it is better to live in a house built and furnished in an absolutely healthy manner than in the most beautiful structure yet built that is not so characterised, it is best of all to live in a beautiful house that is provided, not with the latest sanitary devices and contrivances, for these are often faddish things that come and pass away, leaving no mark behind save the bills they have produced, but with every health-giving contrivance within reach of the builder. The artistic architect may not always appreciate what the sanitary engineer and health expert can do, but it is a distinguishing glory in American architecture that artistic and sanitary improvements have gone hand in hand.

And another strong point in this new domestic architecture of ours is that it is not confined to one part of the country. The north and the south, the east and the west, abound with examples of the best types of this form of dwelling. In the New England and eastern States they are to be found both in the smaller towns and in isolated sites. In the far west, in Chicago, in St. Paul, in Minneapolis, in Denver and other great western cities the conditions of urban life are such that the city house itself partakes of the suburban character; and while the most interesting examples are not to be found in the west—though many beautiful houses have been built there—the opportunities for this sort of building are greater there than in the east. These buildings are the work of many hands, and they are a striking commentary upon the wide application of artistic ideals to the domestic dwelling by the architects of America.

Boston has, in truth, produced a school of architects skilled in the artistic designing of the country house that can scarcely

be matched in all America. The suburban nature of the towns immediately surrounding the metropolis of New England, and the ample opportunities afforded thereby, doubtless acted as a special incentive to the production of this style of building. The development of suburban towns near other great cities in the east has further helped in the same direction, while the influence of such communities as Lenox and other resorts in the Berkshire Hills, and of Tuxedo in New Jersey, has enormously encouraged the development of the finest grades of country architecture. It goes without saying that much of this building is costly; artistic houses, like artistic pictures, are expensive; but there is still a vast amount of building that comes within ordinary expenditure in these country houses that is endowed with a great deal of taste and beauty, and which in its effect is entirely able to be classed with more pretentious houses. So widespread is the movement, and so essential is some attempt at "art" now looked upon by even the ordinary builder and his speculative brother, that many new towns which have been developed under the movement countrywards now announce in their prospectuses that only buildings of a certain architectural standard (?) will be permitted within their limits. It may not result in a distinctive raising of the artistic quality of house-building in America, but it is a straw that points current tendencies toward improvement. Fashion has not always been kind to architecture, but in this respect, at least, its influence has been beneficial.

By its importance in number and in example the country house naturally takes the first place in the development of artistic composition in American architecture. Whether the artistic revival actually took root in this form of structure or not is immaterial. Here American architects have found their most numerous and most readily available opportunities, and here they have most frequently taken advantage of them. The American country house has a position of unique value in the history of current American architecture, and not only is it of importance at home, but its extraordinary development, its positive graces, its genuinely artistic nature, are readily and eagerly recognised by foreign architects, who, neither in England nor in France, have developed a type of domestic dwelling at once so beautiful and so graceful, so varied and so charming, so bounteous in its forms, so excellent in its plan and its adaptability to the needs and circumstances of modern life. Nothing is more dreary than the average modern French small country house, which is often scarce more than a covering to the people it shelters. It is only when the French architect has a large scheme to work out, a costly château to build, that he produces a design of any interest. In America, however, it is a notable fact that much of the best work in the country house has been done in small buildings, where the cost has been relatively limited and the size moderate, the whole coming within the possibilities of people of moderate requirements.

From the country house it is but a step to the suburban and the demi-detached house of the city and the larger towns. In fact, so closely do they approximate that in many instances the difference is more one of location than of design. This is a phase of architecture with which almost every great city in the country, save New York and Philadelphia, is thoroughly familiar. The opportunities for artistic design in the suburban house are almost as large and as varied as in the country house, with which, as has been hinted, it is so closely connected as to be scarce more than a modification. There is a world of hope in these buildings, for they indicate the handiwork of the trained architect. The town builder and carpenter—who, strangely enough, are kept alive by the publication of books and periodicals nominally printed in the interests of architecture, but really doing the artistic architect a great deal of harm by creating the impression that good buildings may be made by copying indifferent plans, and that, in truth, the architect is not needed at all—are fast disappearing from the conduct of important undertakings in building. They have not yet loosed their hold upon small buildings, it is true; but no one now thinks of putting costly work into such hands. That is one of the minor results the artistic movement has accomplished, though it is a survival that has not yet been wholly eliminated from our architectural system.

The results of this change of method have been most successful, for without trained architects there could have been no successful artistic revival. As in the country house, so in the suburban, the most noticeable result has been the subordination of detail of mass, the obtaining of effects by wall surfaces and by the simplest use of the simplest materials, all applied in a sensible manner to sensible purposes. The value of mass in modern buildings was first made clear by Richardson, but the clumsy heavy walls of rough work affected by that architect have long since passed out of general use in America. Not without a struggle, it is true, for the success of Richardson's work was so tremendous that a widespread and often unfortunate copying and following after him naturally resulted from it. The men who copied Richardson's style, however, fell, as many others have fallen, into the mistaken notion that in copying forms they were copying ideas. The innate artistic

value of Richardson's work thus quite failed to appear in the work of those who mistook roughness and large materials for genuine art. The good sense that necessarily dominates domestic architecture finally recognised the value of surface in design without the roughness and eccentricity that Richardson himself used so much, and which in his hands was a very different thing from what it turned out to be in the hands of his would-be followers. Thus it happens that the most noticeable element of strength in the most artistic of recent domestic work is unadorned wall surface. Ornament and decoration are given naturally subordinate positions. The building speaks for itself as a building, and not for its value as a medium for the display of architectural variety. We do not have this in every good work, it is true, but we do have it in much that is good, and its value and the appreciation of it are growing day by day.

The great lesson taught by the best new domestic architecture in our cities and in our country houses is simplicity. The artistic in architecture is not synonymous with multiplicity of ornament, with an overburdening with "art," spelt with a very large A and put in quotation marks, nor with endless variety. Composition and arrangement and feeling will accomplish more and with less apparent effort and with more permanent results than the most prodigal display. A striking characteristic of much of modern building is its lack of permanency. No building grows old so soon as a new building; like the small boy of the present generation, it becomes old and faded out before its elders show sign of increasing years. Our buildings are apt to be designed in the fashion of the hour, in accordance with the taste of the day or under the inspiration of the latest fad. Architecture for architecture is a cry the meaning of which is only now becoming understood. Already considerable advance has been made in this respect, and in no department of building is it more noticeable than in the dwelling-house. If our houses are less "pretty," as is frequently the case, they are more artistic. The difference is a great one, and exactly expresses the relationship between amateurism and artistic perception.

The dwelling-house, and more especially the country dwelling, is the form of building in which American architecture has made its most pronounced artistic success. Its progress here has been real and marked, and its future development must be watched with the greatest interest. There is a freedom from restraint in designing a country house that admirably falls in with the beauty of its situation. Artistically, it is the greatest distinction American architects have achieved, that they have so admirably solved this one problem. There is still much to be done before the same quality will have penetrated to other fields of labour. In many other groups of buildings much progress has been made, and an architect who has in the dwelling given evidence of artistic ability is quite likely never to fall back into an inartistic mood when undertaking other problems. The artistic dwelling points the way for similar improvement in other fields. A movement so widespread as to include the country house and the town mansion, the church, the commercial office building, and even the storage warehouse, the railroad station and other utilitarian structures is not to be despised. Rather there is lasting hope in it for what is to come, and it may not be too sanguine to hope that we already stand upon the dawn of the day when the artistic architect and artistic architecture shall dominate the buildings of our land and time as once they dominated those of past times. It will not be for the same reason nor in the same manner as in the past, nor will they do their work with the same forms nor apply them in the same way; but they will modify them in compliance with the conditions of American life and work, and thus accomplish, with the aid of the spirit already astir among us, all that the most artistic architecture of any epoch accomplished. The movement, which has long since passed the earlier stages in the dwelling-house, must before long spread to every phase of building.

A VISIT TO OLYMPIA.

A CORRESPONDENT of the *Manchester Guardian* writes:—No part of the Peloponnese is more accessible to the traveller than Olympia; the train takes you thither from Patras in five hours. The journey is an easy one, for this part of Elis is wonderfully flat, and for some distance the railway follows the line of the north-western shore. You pass Dyme and other sites familiar by name to students of Achaean history. Very soon the towering range of Erymanthos comes into view, with its long snowy summit. To an eye accustomed to Grecian scenes every roadside station, with its groups of people, the shepherds in white shaggy coats and capotes of wool, elder men in gay fustanella, peasant women with their simple kerchief-snood and their queenly gait, the lad selling wild asparagus—all seem to form a charming picture. It was dark when we reached Olympia, for Greece has no twilight, and frogs croaked as a noisy welcome from the roadside pool.

A friendly guide with a lantern led us up to the little hotel above the Altis, where we were to spend two nights. It is very plain and homely, but clean and comfortable. On the walls are fading photographs of the German explorers—Curtius, Adler and the rest—who made the great excavations in the years 1875-80.

We were awakened early next day by the tinkling of sheep-bells, and were eager to visit the ruins. The view, looking down to the south-east over the valley of the Alpheios, is a fine one. There is nothing, indeed, stupendous, nothing to overpower. There is the pleasant Kronos hill, green with grass and shady trees, rising above the Altis. The Kladeos, with its deep-cut channel in the soft alluvium, hurries to join the Alpheios hard by. All the hills that rise in broken form on either side of the broad river valley are of soft, crumbling rock, green and well wooded. The general impression is that of peaceful agriculture, rich lands and green fields. The prevailing colour of the friable rocks, where they are visible through the verdure, is a greyish brown, but exposing here and there a broken surface of white. To a visitor from Athens it must have seemed a land of paradise after the barren mountains and rocky roads of his native land. As you look down upon the Altis it strikes you as strangely small. But when you cross the little wooden bridge that spans the Kladeos and enter the famous precinct, you soon find by walking how large is the space and how great the distance from point to point. By degrees the eye becomes acquainted with the scale, the largeness of which is disguised by the vast breadth of the Alpheios basin. For the Alpheios is a wasteful and squandering stream. Rising in the Arcadian mountains near Megalopolis, and receiving many tributaries on his way, he rushes through Elis in a turbid, sweeping course, claiming for his bed a far wider range than his usual volume demands. Anciently the course of this vagrant stream was governed near the Altis by waterways and dams, and when, later, these were neglected and disused, the river found its way into the precinct, flooding it with winter rains, until the ruins of the old temples and treasures were entombed beneath 20 feet of alluvium. All this mass is now removed; the patience of the Germans has laid everything bare, down to the original surface-level. Everything can now be seen. Temples great and small, gymnasium, palaestra, treasure-houses, dedications and statue-bases, all are there—not of course entire, but all *en situ*, exhibiting here a few feet above ground, here a course or two of masonry, here a column standing complete, and here again only a ground plan visible. At first the eye is simply bewildered with such a multitude of buildings. But presently we are able to distinguish certain leading features. First, there stood the great Temple of Zeus in the centre; the huge drums and capitals lie all about in gigantic ruin. You can trace the ground plan clearly; you can tread the original cellar floor of black marble, and mark this very spot where the famous statue of the god, the masterpiece of Phidias, rested once upon its base. The sculpture, metopes and pediments—so far as they were recovered—have been removed to the museum. Then further to the north stands the older Temple of Hera, with a number of its rough-hewn columns fairly complete, and its cellar walls, up to 6 feet of their height, entire. Not a fragment of entablature or of metope has been found, but quantities of gaily-painted terra-cottas which formed the antique antefixæ, cornice and acroteria. As Pausanias tells us that in his day one of the columns was of wood, it has been inferred that originally the upper portions of the building and all the columns were of that material, and that as the latter decayed in the course of centuries they were replaced by columns of stone; this would account for their irregularity in form and size. The entablature was doubtless of wood and embellished with terra-cotta; this alone will account for its total disappearance. In quiet and solemn beauty this archaic temple, ruin as it is, satisfies one more perhaps than any other monument in the Altis. Then the eye turns to the row of treasure-houses, built by the leading Dorian cities, on a terrace under the Kronos hill; you ascend to them by a flight of steps older than the Persian wars. Small in scale and solid in style, but greatly varying in material, colour and decoration, these treasures, besides their utility, must have added a very picturesque feature to the Altis. Quite at the other end the slim Ionic shafts of the old palaestra attract us, and as we wander among them under the noonday heat it needs but little imagination to reconstruct the cool spaces and echoing colonnades which once sheltered the youths of Elis from the burning sun. Yonder circular ruin is clearly the Philippeion, by which the Macedonian conqueror commemorated his victory at Chæroneia. Further away is the entrance to the famous Stadion, where the foot-race was run—the greatest "event" in Greek athletics—and the other contests of the Olympian programme. The thousands who came to see came as pilgrims to a sacred place, and shared in the worship of the gods before they took their seats upon the hillsides above, under the blazing July sun, to watch the games. Every ruin we pass has a story to tell us. But within and around all these larger buildings are relics of in-

numerable dedications, inscribed statue-bases of victorious athletes, sockets of ancient stelæ on the temple steps, between the temple columns and everywhere else. Most interesting, perhaps, is the triangular base of the "Victory" of Pæonios, and the base (*in situ* within the Heræum) of the Hermes of Praxiteles.

This statue, with the rest of the sculpture found in the ruins, is now in the museum that crowns the hill above. It is a cool and pleasant retreat from the intense heat of the sun without. The smaller cases contain the little bronzes; but the most important of these have been lately sent to Athens to form part of the bronze-room which is now being arranged at the central museum. The architectural terra-cottas are collected in the corridors. But what strikes us most are the pedimental sculptures from the great temple, so well known to us by photographs and casts. But the noble head and figure of the Apollo forms the centre of the one pediment, and the gracefully significant pose of the Kladeos in the angle of the other has a force and a beauty in the original which no reproduction can convey. Close by there rises the "Victory" of Pæonios, bearing witness in its flow and force how much its maker had learned of Phidias; but the face is sadly broken, and so is the sail-like scarf behind, and we feel that the figure, beautiful as it is, lacks the genius of the Athenian master. The famous Hermes has a room to itself. We stayed long to study and admire. The lighting of the room could be improved, and one wonders why, if the legs of the statue may be restored (one foot, of course, is original), the arms should not be restored likewise. Surely it were better to leave the original untouched and to restore the statue completely in plaster only. We know now for certain that Hermes held out a bunch of grapes to the infant wine-god. The museum from outside looks gaudy and garish, and its colour and decoration form a harsh contrast to the mellow and tranquil tenderness of the surrounding landscape. Archæology seemed to have more here of the curious spirit of science than the subtle sympathy of art. For, indeed, the impression left by Olympia upon the mind is a sweet and sombre calm. You forget the glories and excitements of those ancient days, the rush of chariots, the crowds of pilgrims, the rivalries of cities and of kings, the wealth, the splendour and the pride of that vanished world of Greece. The scene no longer speaks of these; their day is past. Nature now has resumed her sway and reigns supreme. The grey, crumbling hills, the rich woodland, the rushing streams, the corn and the grass, these fill the landscape. As you walk among the excavations it is like treading amid the ruins of some ancient cathedral or abbey, so tender, so quiet is the scene. It was not so when Germany had but lately finished her task; then all was white and clear, and told its tale with scientific precision. But now the grass makes a carpet everywhere, and flowers peep round every fallen stone. Each footstep stirs the fragrance of wild lavender or of thyme, and the deep crimson anemones look up at you with darkling eye. It is not a matter of sentiment, but of fact. The porous stone, so full of shells, of which the temples are built, has lost or is losing the stucco which at once afforded protection from weather and opportunity for coloured decoration. The rain soaks in without hindrance, and dooms the whole to ultimate decay. For ruins, like buildings yet unfallen, have their destined life. Time tells on them at last, and the moment surely approaches when the ruin becomes indeed a ruin, and the form and colour of the past can no longer be recovered from the relics that survive.

THE SCULPTURED STONE AT ROSEISLE.

THE following letter from the Earl of Southesk appears in the *Scotsman* :—

Some weeks ago I received from Dr. Cramond a notice reporting the discovery of a sculptured stone in a "prehistoric grave at Roseisle," and recently he has favoured me with a full-size drawing of this stone—the devices on the back taken by measurement, those on the face from a rubbing. Accompanying the drawing was a ground plan of the grave, with a letter from Mr. Dawson, the discoverer and careful preserver of these relics of antiquity. So clear and precise is the information thus supplied, that I feel myself warranted in offering a few remarks (trusting they will not be unacceptable) on the characteristics of the symbolism which this stone presents, though aware that inspection of the original frequently leads to changes in opinions that have been founded on copies however carefully prepared, or even on casts, photographs and rubbings.

The Roseisle stone is characterised by several very remarkable and perplexing peculiarities. On its face, as Mr. Dawson writes, "there is no attempt made at dressing, the edges and one end are tide-washed." So likewise is the surface, which bears on it certain natural figures—"neat and fine polished . . . rubbed out, not picked out"—viz. a large wild goose (or possibly wild swan, the treatment being slightly conventional),

standing, with its head resting on its back, and beneath it a large horizontal salmon, somewhat less in relative size.

On the back of the stone, which is "the natural bed of the stone, split off the rock either by the waves in a storm or by the agency of man," it bears incised geometrical symbols resembling those elsewhere found in Pictavia,* viz. two large crescents, one barred with a V-shaped "sceptre," the other marked in its concavity with a nearly circular notch; a large wide-lined disc, connected at the side with a wide horizontal band, and a small narrow-lined circle joined to a similar semicircle of similar size by a single straight vertical line. Regarding this last, however, I am satisfied that the semicircle was originally a full circle. By analogy it ought to be, and Mr. Dawson writes regarding this part of the stone:—"I am convinced that a piece has been broken off, as it does not show the same age as the rest of the surface." These symbols have been "picked out with a blunt tool," and from the character of the surface Mr. Dawson has no doubt that they are of later origin than the goose and salmon devices on the other side.

To economise space in dealing with subjects hard to discuss with brevity, I believe it will be the best course, in my further remarks, to enumerate seriatim the peculiarities that characterise the stone, confining comment to the explanations required under each heading.

1. *Position of the Stone as a Horizontal Sidepiece in a Grave of Evident Antiquity and in Company with Stone Implements.*—The only similar case known to me is the find (in 1834) at Linlathen, Forfarshire, when a fragment incised with the so-called "Elephant" symbol (almost certainly the Solar Boar, honoured alike by Celts and Norsemen), was discovered between the massive covers of a cist in a cairn, which was "paved with waterworn pebbles," and contained a small urn and bronze dagger (Spalding Club, "Sculptured Stones," vol. ii. p. 54, pl. 100). Regarding the date of this and the Roseisle interments, little can be predicated except that they are ancient and probably non-Christian. Stone implements were used for ages after the termination of the stone period, and frequently occur in company with metal objects.

2. *Difference of Workmanship on the Face and Back, and Apparent Reversal of Point of View for Each.*—As we have seen, the bird and fish side exhibits to all appearance the older work, and in this case the animal forms indicate the stone's true position if set on end. But if it is thus placed to suit the natural requirements, we discover, almost beyond doubt, that the geometrical symbols on the other side are then shown inverted. Among the very numerous examples of Pictavian symbolism, whether incised or embossed on monuments, or traced in caves, no such objects can be seen as independent crescents placed convexity downwards, or a V-shaped sceptre set angle upwards. Were a choice imperative, I should almost prefer to invert the goose and salmon. The stone must have been twice utilised for monumental purposes, and its appropriators on the second occasion have ignored or insulted its former inscriptions—a carelessness or malignity to which antiquarians could find many a parallel. Perhaps (like the Anwoth figures and Baginbun inscriptions) the first carvings were made on a rock or earth-fast stone, whose top was subsequently split off, as Mr. Dawson suggests.

3. *Characteristics of the Symbolism.*—The salmon is fairly frequent on Pictavian stones. The swan only appears in the cave tracings, and on two late slabs of the Christian period—very strangely associated. Of the goose, however, there is a fine early incised example at Tillytarrant, and several geese occur among the cave tracings. By the Celts this bird seems to have been held as an "unclean animal" (Wise, "Paganism in Caledonia," p. 176), but among the Norsemen it was honoured as one of the god Frey's special attributes, as likewise was the salmon. Exemplifying this, an ancient bronze knife-blade from Scandinavia bears on it a goose and a salmon, together with the (separate) discs of the sun and of the moon. The swan was sacred to the sea-god Njord—and probably likewise to his daughter, Frey's consort Freya—and it belongs to the same symbolic family as the kindred bird. Figures of wild geese abound in the very ancient rock tracings at Bohuslehn in Sweden; it is an essentially Scandinavian symbol or device. I entirely believe that the first carvings on the Roseisle stone were made by a Norseman's hand. Whoever was the worker, the design and execution are alike admirable; I have seen few things more beautiful of the kind. The wild goose especially, in its grace and noble simplicity, reminds one not a little of the art products of ancient Greece, though Scandinavian in its general style and character.

Turning to the other face of the stone, we again encounter peculiarities, apart from the question of inversion, which need not trouble us. The deep circular notch in the upper crescent is almost unique. On the Newton "Serpent Stone," one of the discs in a double disc symbol (the so-called "Spectacle Orna-

* In my *Origins of Pictish Symbolism* I have endeavoured to find the true meanings of all the symbols, but for present purposes I will use ordinary or general terms which assume nothing.

ment") is notched; and here I cannot but allude to my own theories, and remark that I suppose that figure to be the conjoined sun-and-moon symbol (which occurs on Scandinavian objects, in connection with Frey), and conjecture that the notch is a mode of designating the lunar nature of the disc thus characterised. A notched form, in size between disc and crescent, occurs sparingly in the cave-tracings and elsewhere; in those cases also, I presume, to indicate lunar character, for I view the crescentine Pictavian figure as solar, as the symbolic axe-blade of Thor, the thunder-god.

Unique likewise is the left-hand terminal of the V sceptre, in its tridentine form. It is a strange fact that we seldom, if ever, find identical forms of sceptre-terminals in any two cases, nor even in the terminals of any single example, save where these happen to be mere careless sketches or tame conventionalisms, as in some late Christian specimens. I therefore suspect that these terminal figures concealed definite meanings, whether as words or symbols it would be idle to conjecture.

The large circular figure beneath the crescents is rendered difficult by the presence of the horizontally projected bar at the side. With this adjunct it resembles the object known as the "mirror-case" (on my view, the sun-disc, an attribute of Frey), so common on the Pictavian stones, but here laid flat instead of rising vertically above its stand. I incline to think that it has been thus shown because (in the present unique example) a double-disc symbol has been employed as a pedestal in place of the common stand for some very special reason, the bar at the side being added to mark the nature of the large circle, which otherwise might have been taken for a "ring" symbol, or for a non-handled "mirror." If we do not admit the original circularity of the semicircle at base of the small figure, the object, instead of being viewed as a double-disc symbol, will appear to be the equally common "mirror" symbol—my "moon mirror," sacred to Frey's consort Freya.

Beyond these necessarily incomplete remarks I can offer, I fear, but little tending to serve towards the solution of the Roseisle problem. I will merely add, as the expression of my personal opinion, that nothing specially obliges us to attribute an abnormal ancientness to the grave or to the memorial-stone. For reasons elsewhere assigned (*v.* "Origins of Pictish Symbolism"), I am inclined to assume 450-600 A.D. as the period of the incised pillarstone symbolism. Accepting this, we might suppose that Scandinavians engraved the goose and salmon some while before the earliest of those dates, and that men of another race (possibly half-Celt, half-Norsemen), utilised it for their own purposes in the fifth or even the sixth century, and yet after this there would remain centuries enough for the final appropriation of the stone by some sea-roving or indigenous tribe, ignorant of Christianity and persistent in its use of primitive implements and antiquated modes of burial.

ST. GEORGE'S HALL, LIVERPOOL.

THE subjoined scheme for the sculpture decoration of St. George's Hall, prepared by Mr. T. Stirling Lee for Alderman Rathbone, inspired the report submitted to the Liverpool Corporation:—

At your request I am forwarding you a complete scheme of the sculpture decoration for the above building, that some record may be kept of the thoughts and ideas that have developed since my connection with the work. That a report is most necessary was clearly brought home to me when one of the leading citizens asked, "Where are the niches?" and on being told there were no niches but many bases, he had no idea that these bases and pedestals were for sculpture.

Perhaps an illustration drawn from the sister art of music will bring before us more clearly the unfinished condition of St. George's Hall at the present time. Suppose, for example, during the performance of the "Messiah" the conductor had to stop the orchestra continually to explain, "There is a solo to be written here," and, again, "Here a chorus," "Here a quartette," in fact, all through he had to interrupt to explain the unfinished parts, one can imagine the irritation of the audience. St. George's Hall is exactly in this unfinished condition from the architect's and sculptor's point of view. St. George's Hall, in musical language, is the realisation of the wish of one of the greatest composers, viz. that he should have four orchestras and four choruses playing simultaneously. On the hall you have solos, choruses, quartettes on the four sides of the building, only two of which choruses are written, "The Pediment" and "The Progress of Justice" (the panels).

To be sculptured there are two equestrian figures; twenty-two panels, six large and sixteen small; four groups, twenty-eight statues and twenty-eight bases for ornamental carving, as designed by Elmes. All these remain to be sculptured before the architect's design will be complete, and St. George's Hall made one of the grandest buildings of all time—a memorial of the greatness of the nation.

One must approach any scheme of this grandeur with the

full knowledge of the reason and purpose of the building; also with a clear conception that the name of St. George makes it of more than local importance, and it becomes the voice of a prosperous city to honour its country. Firstly, we find two equestrian pedestals at the base of the building, flanking the whole structure; the reason, architecturally, is that to avoid weakness the eye should run from the colonnade on the south side to the colonnade on the east, round the base of the equestrian figure, to give the effect of the building being square at the base; for the light and shade composition it is necessary to have this sculptured figure, that the scheme may run through the building by connecting the pediment, capitals, figures, panels, right down to the base, and the lines of the horse are best from the point of view of composition of line. The material to be used—bronze—fulfils this object, which will give the dark note necessary to the composition of light or shade, and give solidity to the whole. What subjects should be used for these two equestrian groups? One cannot help feeling the appropriateness of "The Winged Dawn and Evening," "The Morning and Evening of Life," "The Beginning and End of a Nation's Day," and keeping in mind one continuous thought—this to be the key of the subjects written on this national monument.

We follow the design on the east side, and we come to the series of panels on each side of the portico. These are intended architecturally to bring the eye up and down the building and along to the centre; also, for the light and shade, it is necessary to have some half-tone, which is obtained by relief carving. The subjects for these series of panels should be "The Growth of Justice" and "National Prosperity." These two enrichments we find carried through the whole side of the building, connected by the statues on the pedestals under the portico, the subjects for which no doubt should be to honour the sons of Liverpool who have brought honour to her. Over these panel friezes we find twelve bases for figures. The reason for these is quite clear—that the eye should follow along the panels up to the figures, and by the means of these carved stones tie the carved capitals and carved bases; also to give beautiful notes of light, breaking up the depths of shadow made by the recess behind them. The number being twelve, suggest the Twelve Stones of the City, the Spirits of Light and Virtue governing and inspiring Justice and Progress.

Continuing the upward growth, you stop on two smaller panels on the corners of the building, for the reason you must have some enrichment, some carved shadows, that your eye may pass from the figures round to the pediment on the south side, and up to capitals and round the building on the apse end. The subjects for the corner panels—the scientific discoveries of the present age—seem appropriate. By coincidence, round the concert-room facing the art gallery, the museum and the library we have nine panels, which at once suggest the Nine Muses, flanked as they are by two panels for music and nature.

On the south end we have the pediment, here most rightly looking on the river and docks. We find the reason of Liverpool's prosperity carved in stone, "The Triumph of Commerce," and on the west side, facing the city, we find bases for figures which perhaps are more necessary to the building than any other. On quiet inspection you can see what a wonderful improvement these figures would make between the columns, and the subjects one would wish to have facing the city, as they do, would be the attributes of municipal government.

The architect now concentrates his design on a centre roof, covering the large hall, and this roof he joins to the outer structure by means of four pedestals and groups. One can see the reason for these groups if we look at the building from a short distance; the two parts are joined together, the light and shade connected by sculpture, enabling the eye to run from one structure to the other, making the design continuous and harmonious.

The subject of these groups should be to illustrate the part England has taken in the civilisation and colonisation of the four parts of the globe, and stamping St. George's Hall as a national monument recording the possessions of England at the time the hall was built.

We now pass quietly and beautifully all round the top of the building by means of lovely mouldings and carved ornamentation as designed by Elmes, and you suddenly have two deep, full notes of shadow on the north and south, and Elmes has said his last word. St. George's Hall remains to record the public spirit of Liverpool, and to hand down a memorial worthy of the largest and richest nation in the world.

SUBJECTS.

Equestrian Groups.—The Winged Dawn and Evening (A Nation's Day).

Panels, Two Friezes. Twelve Panels Facing the Country.—Six, The Growth of Justice. Six, National Prosperity.

The Twelve Figures above the Panels.—The Spirits or Stones of a City.

The Growth of Justice.—Panels: Childhood, Girlhood, Womanhood, Administration, Result, Eternity. Figures: The Spirit of Wisdom, The Spirit of Council, The Spirit of Might, The Spirit of Justice, Peace, Eternal Light.

National Prosperity.—Nature and her Children, Agriculture, Manufacture, Commerce, Unity, Prosperity, Industry, Patience, Truth, Energy, Love, Progress.

Pediment.—The Triumph of Commerce.

Panels round the Concert-room.—The Nine Muses flanked by Music and Nature.

Panels on the Corners of the Building.—The Scientific Discoveries of our Time.

Figures between the Columns on West Side.—The Attributes of Municipal Government.

The Four Groups facing the Four Quarters of the Globe.—The Spread of Civilisation and Colonisation, The Four Great Colonies of Great Britain.

Ornamentation of the Top of the Hall.—The same as in Elmes's design.

I have endeavoured to give you some comprehensive scheme, trusting it is worthy of such a grand building.

Home Reading.

SIR,—The object of the National Home Reading Union is to render study attractive. The Union endeavours by all means which can be devised to interest people in reading for the sake of information and mental culture as distinguished from mere bread-winning, or the pastime which often means little more than obliterating time—an anodyne to silence activity during the intervals of work. To this intellectual mission the press has lent ungrudging support, showing that the desire of our journalists is to improve intellectual taste and to stimulate thought.

Of the various methods adopted for the furtherance of its aims, none has proved more successful than the patriotic attempt made by the Union to interest Englishmen in the history and literature, the physical geography and the natural history of their own country.

Those who attended the summer assemblies held at Buxton and Salisbury last year not only enjoyed the meetings while they lasted, but left with the feeling that they had annexed these two very dissimilar districts as a part of their mental property for the rest of their lives. This year the Union "period" comprises the fourteenth, fifteenth and sixteenth centuries, and Leamington has been selected as the place of meeting during the first week in July, since its neighbourhood is richer than any other part of England in memorials of this time.

The programme is far too long for insertion, but its general scope may be gathered from an outline of the plan upon which the lectures and excursions have been arranged. Major Leonard Darwin, M.P., chairman of the executive committee of the forthcoming congress of geographers, will lecture on the "National and International Advantages of the Study of Geography;" Professor Sir Robert Ball on "Comets;" Principal Rendall on the "Last of the Stoics;" Professor Bridge on "Shakespeare and Music;" Dr. Lawrence and Mr. Tanner give a course of four lectures on history; Mr. Marr four lectures on the geology, and Mr. Scott Elliot four lectures on the botany of the district; Dr. Braunholtz lectures on the "French Stage in Shakespeare's time," and "Guy of Warwick in Early French Romance;" while Mr. Yule Oldham lays before the meeting the remarkable results of his investigations into the history of the "Discovery of America."

Excursions will be made to Stratford-on-Avon, Warwick, Guy's Cliff, Kenilworth and Stoneleigh Abbey, Wroxall Abbey and Baddesley Clinton, Coventry and Compton Wyniates, under the guidance of Sir Arthur Hodgson, K.C.M.G., Mr. de Courcy Laffan, the new headmaster of Cheltenham, the headmaster of Warwick School, Lord Alwyne Compton, Bishop of Ely, Professor Hughes, Professor Ridgeway, Mr. Marr, Mr. Scott Elliot and many other gentlemen who will expound the history, archaeology, geology and botany of the places visited.

The Vice-Chancellor of the University of Oxford, the Bishop of Hereford, Principal Heath and others will also take part in the week's proceedings, which include not only the substantial items already named, but also many social entertainments provided with a due regard for the instincts of holiday makers. The Mayor of Leamington "receives" the members of the assembly at the Town Hall; the Earl, who is also Mayor, of Warwick and the Countess receive them at the Castle, and the headmaster of Leamington College receives at the College; while concerts and other entertainments will be provided in the Pump Room and the Jephson Gardens.

It is in its comprehensiveness and its cheapness that the National Home Reading Union differs from the learned societies. The summer assembly is arranged for those who are not experts in the subjects which its programme includes, and they are open to anyone who pays the small fee of seven shillings. The Secretary of the National Home Reading Union, Surrey House, Victoria Embankment, London, will be glad to send the programme to any who write for it.—Yours very faithfully,

ALEX. HILL.

Downing College Lodge: June 7, 1895.

GENERAL.

The Subscriptions to the church of the Sacré-Cœur at Montmartre amounted in May to 77,625 francs, making the total sum received 28,062,800 francs. The total expenses have been 27,688,474 francs.

The Library of the late Sir Charles Newton, containing the best works relating to classic art and archæology, which he was occupied throughout the greater part of his life in collecting, has been purchased by a German bookseller.

The French Academy of Fine Art has awarded 500 francs to M. Clausse for his book on "Basilican and Christian Mosaics;" a similar sum to M. Fauré for his "Theory of Proportions in Architecture;" and to M. Henri Havard for his "The Arts and Furniture."

The Leeds Art Gallery Spring Exhibition closed on Saturday. It was visited by 28,869 persons, and forty works were sold.

A Design by Messrs. Clark & Moscrop, of Darlington, has been selected by the trustees for the Fox Almshouses, Norton, Stockton-on-Tees. There were about fifty competitors.

Mr. W. Mather, M.P., has promised to present to the engineering laboratory of the University of Cambridge a 20 horse-power combined steam-engine and dynamo of a modern high-speed type, specially adapted for experimental work. The engine is now in process of construction by Messrs. Mather & Platt.

A Painting, by James Giles, R.S.A., depicting the demolition of the old gasworks, which occupied the site of the present railway station, has been presented to the Gas Corporation of Aberdeen by ex-Dean of Guild Walker. The artist was a director of the gas company.

The Fortieth Annual Exhibition of the Royal Photographic Society will be opened on September 28 and closed on November 14. The judges are:—In the Art Section—Mr. W. L. Colls, Colonel J. Gale, Mr. F. Hollyer, Mr. B. G. Wilkinson and Mr. W. L. Wyllie, A.R.A. In the Technical Section—Captain Abney, Mr. Chapman Jones, F.I.C., F.C.S., and Mr. Andrew Pringle, F.R.M.S. An illustrated catalogue will be published.

The Restored Crypt of St. Bartholomew the Great, West Smithfield, will be dedicated by the Bishop of Stepney on the afternoon of St. Peter's Day, June 29. The lady chapel, which is the last item in the committee's scheme of restoration, might have been completed for opening at the same time, but sufficient funds were not in hand. It is, however, roofed in and the windows are glazed.

The Northern Architectural Association will to-morrow pay a visit to Jesmond Dene House, belonging to Sir Andrew Noble, of which Mr. Norman Shaw, R.A., was architect, and the new tennis-court designed by Mr. Frank W. Rich.

A Bust of Bailie Mearns, senior magistrate, Aberdeen, executed by Mr. D. W. Stevenson, R.S.A., which was exhibited at the Royal Scottish Academy, has just been placed in the Aberdeen Art Gallery.

Mr. W. Hawley Lloyd, architect, has reported on the condition of Leamington parish church, which requires an outlay of 750*l*. A large amount of damage was done to the fabric of the church by the recent gale, and in addition to that the Warwickshire stone of which the church is built had so "perished" in some of the mullions and traceries that a great deal of other work required to be taken in hand before long. The matter has been referred to a committee.

The Death is announced of Mr. T. A. Sugden, architect, of Keighley, formerly of the firm of Sugden & Smith, at the age of seventy-five years. The gross amount of the personal estate has been entered as being 11,649*l*.

The Bath Municipal Buildings, erected from the designs of Mr. J. M. Brydon, who obtained the work through competition, have just been opened. The buildings have cost about 32,000*l*., and electric light has been fitted throughout.

The Death took place on Monday, at Shepton Mallet, of Mr. Henry A. Budd, architect, of Shepton Mallet and Glastonbury.

THE WEEK.

EXHIBITIONS of water-colour sketches have become popular, although it is not always easy to discriminate between the sketches and the drawings. Sometimes the former are more elaborate, and the advantage which might be gained by students and others from genuine sketches is therefore lost. As a consequence suspicions arise which are not advantageous to artists, and it would be wise for the very respectable members of the Water-Colour Society to consider that fact. In many ways the Institute has hitherto shown more respect for public requirements, and the show of sketches to be now seen in Piccadilly has a more genuine appearance than those of Pall Mall. Among them are twelve by the late EDWARD HARGETT, an artist who was not appreciated as much as he merited. Mr. GREGORY, A.R.A., contributes a sketch which is almost a picture of a child in the midst of a field of yellow corn, and which shows the artist's defiance of prettiness in the expression on the face. Mr. WHYMPER suggests that Greenwich at low water is not without attraction. Mr. NISBET has a charcoal and colour sketch, which, when seen at the right distance, is effective. Mr. ST. GEO. HARE's realistic painting of the *Crucifixion* consists of the figure of the SAVIOUR only, standing out from a dull background. Mr. CATTERMOLLE is successful with his painting of *The Power of Music*, representing a group of rough Venetians listening spellbound to a girl playing on a mandoline. There are many more good examples, especially in landscape, which is better adapted for quick representation and the expression of sudden appreciation of effect than figurework. On the whole, it is a pleasing exhibition that ought not to be missed by visitors to London.

It is remarkable how few statuettes in bronze are produced in this country, although we possess so many of the noblest examples of Greek sculpture. In Naples the reproducing of the figures found in Pompeii and Herculaneum is fast becoming a great industry, and England is probably the principal patron. Yet these figures are inferior to many which are to be found in the British Museum, or perhaps it would be more true to say entombed there, for they are unknown to the majority of people in England. The method adopted in Naples is as follows:—A piece-mould is made upon the statue itself, and from this a hollow wax statue is cast. The wax is then carefully touched up with a warm stylus. It is then filled with plaster of Paris, which forms a core, and having been surrounded with a jacket of clay it is placed in a kiln. Here the core becomes hard, the jacket becomes like a brick, and the wax is melted and poured away. Into the orifice from which the wax came the metal is poured from a crucible, the work is then chiselled and touched up, and brought to the desired colour by various processes. The metal used for the best castings is composed of 9 parts of copper and 1 of tin. Large numbers of the reproductions have been sent to London, Sheffield, Birmingham, Belfast, Dublin, Edinburgh, Preston and other towns. Is it not time for English founders to attempt some competition with more noble works?

ON Saturday last it was decided by the Académie des Beaux-Arts to award the Prix Houlléviqgue, which is worth 200*l.*, to M. NENOT, the architect of the New Sorbonne. This was the first time to employ the gift, and we are glad to find an architect selected as recipient. The condition imposed by the donor is that his prize is to be awarded to the author of some remarkable work produced within a period of four years preceding the time of inquiry. It may belong to any of the departments represented by the Académie, and consequently paintings, sculpture, a piece of architecture, an engraving, and a musical composition are alike eligible for the reward. The Prix Lehmann, value 120*l.*, which is offered for the encouragement of high-class studies in painting, was awarded to Mdlle. ELIZABETH SONREL for a water-colour drawing, *The Sommeil de la Vierge*, now in the Salon. M. LOISEAU ROUSSEAU obtained the Prix Desprez, worth 40*l.*, for his sculptured figure, *The Poisoned Slave*, which is also in the Salon. The Prix Maxime David of 12*l.*, for the encouragement of miniature painting, was given to Mdlle. CHAUCHE FOIN.

ACCORDING to the British Consul, within the last few years vast portions of Naples have been pulled down, and the former narrow tortuous alleys have been replaced by wide streets, lined on either side by handsome palaces. In order to do this great work it was necessary first to build dwellings for the poor who would be evicted from the slums which were to be razed to the ground. Buildings sufficient to house several thousand people were built in large blocks, separated by wide and airy streets at the east end of the town. Then the demolitions began, and a street called the "Rettifilo" was projected, which runs from the railway station on the extreme east to the General Post Office in the centre of the town. A great part of this magnificent street is now open to the public, and its construction has entirely altered the conditions of existence in Naples. The enormous traffic of the town (for no city in Europe, except London, has a traffic equal to that of Naples) was congested by the narrowness of the streets, and this is now at an end; access to the principal railway station is easy and pleasant, besides being much shorter and safer. But the increase of the town eastwards has in one respect been a source of trouble to the foreign communities. About sixty years ago great difficulties were made as to the interment of Protestants, but eventually, by means of Her Majesty's Ambassador to the Court of Naples, King FERDINAND IV. was induced to allow the British Government to acquire a piece of ground, which was placed in the hands of trustees, and became the recognised burial ground for Protestants of all denominations. When the extension of the town began the new buildings crept right up to the cemetery walls, and notice was given that no further interments would be allowed to take place there. The cemetery, fortunately, is the property of the British Government, and the municipality accordingly hesitated to carry out plans by which either a road would have been made through the middle of it, or the whole cemetery removed bodily. It now remains a beautiful garden, full of costly marble monuments, and surrounded by workmen's dwellings. A new cemetery is provided by the municipality.

AMONG the public works which are in contemplation in Spezia are the building of a new town hall, rendered necessary by the actual number of municipal offices (92,000 lire have been voted for the purpose) and the drainage of the town, and especially of the Viale Savoia. Another important, and at the same time urgent, undertaking which has been resolved upon, is the building of a new hospital. The present one was barely sufficient when the population of the town was far below its present numbers; and now it is not only sadly deficient in accommodation, but hemmed in by houses that have sprung up around it. The site of the new hospital has not yet been selected, but the slope of the hill crowned by the ruined castle of San Giorgio may eventually be chosen. Fifty thousand lire have been voted as an initial outlay. Moreover, provision has been made in the municipal budget for 1895 for opening up new streets, enlarging the gasworks, &c.

WHEN we find that ninety-one pictures, including old masters, were sold for 87,144*l.* at CHRISTIE'S on Saturday, it is no wonder people abroad imagine that in England any sort of coloured canvas is precious. Every season we receive applications to find purchasers for pictures, but this year they are more numerous than ever. How GAINSBOROUGH would stare if somebody prophesied that his *Lady Musgrave* would be sold for ten thousand guineas and despatched to America, or fifty times the sum he received for it. The prices for TURNER'S pictures continue to be incomprehensible, for by what standard can a scene with so little in it as the *View of the Thames from Mortlake* be judged, when it is considered worth 5,460*l.*? A far finer work, if judged by the handling, is COTMAN'S *Grand Marine Subject*, which was sold for 2,300*l.* Compared with the prices for GAINSBOROUGH'S and ROMNEY'S works, REYNOLDS' portraits realised moderate prices. The first president's own portrait, which belonged to one of his successors, was sold for 1,100*l.*, and the *Mrs. Damer*, which is rather novel in treatment, for 2,300*l.* Whether the prices have a beneficial effect on modern English art is not apparent, but too often the present has to compensate for the past.

A LOST ART.

THERE was commotion among artists and amateurs in Paris in 1752 when M. DE CAYLUS read a paper before the Académie des Belles-Lettres on the encaustic painting of the ancients. During eleven centuries that process was forgotten by all, and it seemed doubtful whether any research could explain what encaustic was to a Greek artist. CAYLUS at the time was in an anomalous position. It was doubtful whether he was a professional engraver or a connoisseur. REYNOLDS, in describing a study of RAPHAËL, said a print from it by Count CAYLUS was in every hand, a testimony to the popularity of his engravings in England. Originally the Count was a soldier, and he gained experience in the French wars. When peace was concluded at Rastadt he "went in" for art, and he studied not only pictures in Italy but the remains of architecture in Greece and Asia. On his return to France he applied himself to the engraving of plates of medals and precious stones in the royal collection. He was considered to be qualified to become a member of the Academy of Painting and Sculpture. Soon afterwards he was elected to the Academy of Inscriptions. When he read his paper on the ancient process CAYLUS was accordingly known to be a scholarly student, although his chief works appeared subsequent to his posing as a revealer of the lost art of encaustic painting. In 1753 he read another paper on the subject before the Académie Royale de Peinture. The following year he went further, for at a public assembly of the Académie des Belles-Lettres he exhibited a *Minerva* by VIEN, the greater part of which was in encaustic. For the sake of contrast a part was painted with wax which was not submitted to any operation of heat. There was no picture produced in 1754 which excited so much interest.

Obedient to etiquette, CAYLUS had not explained the process employed. Although the *Minerva* was exhibited in one academy, the description of it appeared to him to be within the province of the Académie des Inscriptions. But the artists endeavoured to pluck out the heart of the mystery without his aid. The painting was subjected to all the tests that the senses of sight and touch could afford, but it was by the smell alone that a clue to the process was supposed to be gained. There was an odour of the essence of turpentine perceptible, and it was immediately concluded that the picture had been painted with wax which was subjected to that solvent. Not one of the artists was able to speak from experience or hearsay of colours obtained in that way, however, as colours must be more or less fluid in order to be used; and, as there was an indication of turpentine, it was reasonable to suppose that encaustic signified the application of wax colours dissolved by an essence.

A few artists tried the experiment, and succeeded in producing pictures on a small scale, which were exhibited in Paris during the early part of 1755. One of those painters, named BACHELIER, was not satisfied with what he had done. He also employed soap with the wax, and found he gained more body. After he had used paints made up in that way, he tried the effect of heat on the picture, and as they did not vanish, BACHELIER concluded that he had succeeded in rediscovering the old Greek process of encaustic. Examples were shown in the Salon of 1755. They appeared like engravings to which dirty colours had been applied. But the French were always partial to colours deprived of brilliancy, and BACHELIER'S name was prominent for a short time.

An effort was made to gain for him, instead of CAYLUS, any credit which was to be derived from the attempt to revive encaustic. It became a case of turpentine *versus* soap. ROUEL, the chemist, was said to have ascertained that the Greeks used soap, and from him BACHELIER obtained the hint. CAYLUS'S essence of turpentine was not, therefore, warranted by classic authority. It was overlooked that in none of his papers was the essence mentioned, while he described three or four ways of treating wax. Then it was tried to be made out that in 1749 BACHELIER by accident had discovered the utility of the essence, and had painted a picture in which it was used, but had afterwards abandoned it and substituted soap dissolved in water. He therefore claimed to have priority of CAYLUS in the discovery. Nothing was gained by the controversy, for, in

spite of all that was spoken and printed, encaustic painting could not win favour in Paris as a novelty or as a resuscitated art. Nor were subsequent attempts in Florence by PARENTI and FABBRINI more successful.

BACHELIER'S attempts must have frustrated the scheme of CAYLUS. The Count evidently supposed he had discovered a source of wealth. At first he acted as if the idea of revival were his alone. Then it was admitted that a physician in Paris, named MAJALTY, had co-operated with him. The method proposed to be employed by them was kept secret as long as possible, which suggests that financial success was sought rather than an increase of knowledge. BACHELIER, on the other hand, was too communicative, and his descriptions of his experiments afforded opportunities to the wits to exercise their ridicule, and what was said was taken to be no less applicable to the discoveries of CAYLUS and MAJALTY.

It was remarkable that more about encaustic could be derived from the references by PLINY and VITRUVIUS than from the essays of the rival discoverers and their supporters. Wax in various forms was much employed by the ancient artists. In ANACREON'S time the word was as synonymous with painting as canvas is now. In one ode he says "Let the wax speak even in the silence," and elsewhere he exclaims "O wax, soon will you speak." It may be supposed that he was referring to wax medallions, but if any value can be attached to PLINY'S statements, encaustic painting was practised in a time as remote as the sixth century before our era, when the poet lived. As it is recorded that LYSIPPUS inscribed on his paintings at Ægina how they were produced with the help of fire, we may assume that there was no striking difference between the appearance of works in encaustic and those for which other methods were employed. In PLINY'S time small pictures on ivory were produced by encaustic, and it would thus have some relation with modern enamel-painting. It was utilised also for portraits on wood panels.

That it was largely employed in mural painting appears to be certain, and its applications may have been of various kinds. VITRUVIUS, as if by accident, refers to one of them in a passage of his seventh book that has become familiar. When speaking of the difficulty of preserving minium or vermilion from turning black after a few days' exposure to the sun, he mentions the practice of some careful people. After the colour was laid on evenly and was very dry, they covered it with Punic wax mixed with a little oil, which was spread with a brush. Then a brazier with lighted charcoal was brought in contact with the painted wall, by which means the wax was melted. Lastly, the surface was polished with a candle and cleaned with cloths as if it were a statue of marble. The coating of wax was a preservative against the influence of sun and moon. As Sir HUMPHRY DAVY in his researches among the ruins of the Baths of TITUS could find no trace of an encaustic varnish over the painted ornament, while on plain surfaces a reddish hue was visible, he concluded that the encaustic work which VITRUVIUS described was only applicable to walls which were not decorated with figures or ornament in fresco. It is maintained by other investigators that an encaustic varnish was likewise laid on fresco paintings and that it had the effect of heightening the colours as well as preserving them.

That the encaustic process was adopted in several ways is as certain as any antique practice which we accept as true. There are too many references to it to leave any doubt on the subject. The figure of the lady painter and the grotesque of the portraitist which were found in Pompeii do not show that "cauteria" and "ceræ" may not be included among the materials depicted, but on the other hand many writers mention wax colours and the apparatus for burning them in. They are said to have been carefully kept in closed boxes with partitions. What proportion of wax was employed is unknown. The utility of it is also doubtful. The ancient painters were not oil painters, they used gums, resins, bitumens, glues, &c. Wax may have helped to give consistency to the coloured earths. But so much importance would not have been attached to it unless it was more useful, nor so much labour expended on the bleaching and purifying it. Wax may have imparted a softness to colours by which they became more vivid when employed in flesh painting. In that way the poet's admiration of wax pictures

would be understood. According to PAUL DE KOCK, the young Parisians of his day preferred wax figures to marble statues, and a similar weakness was likely to have been known in Athens and Rome.

It was not every painter who could work with wax colours, at least in the palmy days of art. In the period of decline and among the artists of the Lower Empire, wax and cauterising appliances were supposed to be among the contents of ordinary studios. This is evident from the law books. It is laid down that when a painter devised his atelier or studio, it was to be assumed that he included the wax, colours, brushes, *cauteria* and the pots that were necessary for mixing colours. In fact, the words "*pictoris instrumento, ceræ, colores, penicilli, cauteria, conchæ et temperandorum colorum vasæ*" became a sort of stereotyped phrase in legal documents.

The greatest difficulty of all connected with the subject is how the cauterising or burning produced permanency of colours. When OVID describes the prow of a vessel as representing the Mother of the Gods in colours which were burned, he must have known that by the process pictures capable to withstand winds and waves were obtainable. PLINY also mentions that when wax colours which were rendered liquid by fire and which could be laid on with a brush, were used on the outsides of ships, they became so solid that neither the sun nor the salt of the sea nor storms could affect them. Modern colourmakers could not expect to accomplish a similar feat with any wax which is now to be obtained in the market. The application of heat could not achieve permanence with ordinary wax, which must have undergone some change in the preparation, or it was united with another material which developed into an enduring substance when heated. PLINY says distinctly that with the paints which were used to adorn the exterior of vessels brushes were used, and consequently we are justified in concluding that one part of the process did not present extraordinary difficulty. Where skill was needful would be in the preparation and selection of the paints, and in the use of the implements for burning them.

An older method, according to PLINY, was to employ a *cestrum* or *viriculum*, which would be a sort of graver. It could only produce lines, and his words may then be interpreted as meaning etching or engraving on wax. The lines could be filled in with colour, and the slab hardened, assuming that cauterising always produced the effect. But PLINY in the same sentence mentions ivory. "Formerly," he writes, "there were two classes of encaustic, which were made with wax and upon ivory by the *cestrum* or *viriculum*" ("*cerâ et in ebore, cestro, id est, viriculo*"). Whether he intended to suggest that encaustic painting was accomplished on ivory plates without the aid of wax must be always a subject of controversy.

If the experiments of the Frenchmen in the last century were carried on with perseverance and with more co-operation between painters and chemists, it might now be easy to give a more definite meaning to the words of Greek and Latin writers when describing encaustic painting. The members of the Academy of Painting were annoyed that CAYLUS and MAGAULT had not revealed to them how the *Minerva* was produced. They scorned to take the information from the proceedings of a mere literary academy, and the explanation that it was supposed to be especial business of the latter to deal with all matters relating to the arts of the ancients was adding insult to injury. Since that period the subject has not attracted investigators, and as there is no advantage apparent from knowing more about the ancient practice, encaustic painting is likely to remain among the lost arts.

PROGRESS IN EGYPT.

IF the rate of progress in Egypt were to be determined by a comparison of the ancient buildings of the country with any which could now be erected, few would hesitate to say it must be infinitesimal. Perhaps it would be safer to admit there must only be retrogression. The architectural standard is, however, more often applied than is commonly supposed, especially by imaginative critics in the form of French statesmen. Egypt was at one time they think in a condition when the sublime in architecture

was reached; under fitting rulers, such as themselves, those happy days would be restored. Under English domination the colossal has to give way to the comfortable. A great deal is supposed to be attained when it can be recorded that in Cairo there is "marked development, as attested by new streets, handsome buildings, well-appointed shops, brilliant equipages, prosperous-looking natives and other evidences of progress," that Assouan has developed very much indeed because "numerous fine houses have sprung up, including a handsome hotel," and that in Esneh there is a school having "large coloured cartoons on technical subjects, illustrating various trades, such as bread-making, cooking, weaving, tailoring, hat-making, laundry-work, printing, &c."

The PHARAOKS would scorn signs of government in those forms. If compared with the results of the ancient system the cartoons, hotels, excursion parties, sugar machinery, cotton mills, &c., must appear mean. If we credit HERODOTUS, the Egypt which he had traversed contained twenty thousand populous cities, and Memphis was not only as large as London but possessed more magnificent buildings. A visitor is now puzzled when he looks on the natives and remembers that similar men—for the painting and sculpture afford evidence of their relationship—piled up the temples and pyramids. But they were no less remarkable in war than in the arts. The Greeks with all their heroism succumbed to the Egyptians, and other races are to be excused when they also were conquered by the slim soldiers from the Nile Valley. Modern engineering can do little more than imitate the system of the Egyptian engineers. Before ABRAHAM and his famine-stricken band were forced to seek food in Egypt, the overflow of the Nile was stored in Lake Moeris until the time when the river was running dry, and then the reservoir was opened. For the improvement of the country modern ingenuity can devise no better arrangement. A water-supply that could be regulated at will is the dream of all who love Egypt, and many a year must elapse before it can be realised. The need is so oppressive, we need not wonder if occasionally it overcomes the respect for ancient architecture.

In spite of all shortcomings, there is progress in Egypt since the country, happily for itself, came under English guardianship. The extent may be judged from the report of Mr. VILLIERS STUART, which has been issued as a Parliamentary Paper. He is well acquainted with the country. Twelve years ago he was attached as a specialist to Lord DUFFERIN'S mission, and conducted an inquiry into the state of the villages throughout Upper and Lower Egypt. His report was published. By a comparison of the two reports it is not difficult to realise the extent of the change which is due to English inspiration. Probably in no other country are so many beneficent results to be witnessed from the operations of a few years' government. Mr. VILLIERS STUART has probably often wished that a corresponding change could be witnessed in his native Munster, which presents so many points of similarity with Egypt.

Twelve years ago there were as many antique grievances in Egypt as the most enthusiastic archaeologist could desire. What was called justice was administered on Lord Chancellor BACON'S system, that is, sold to the party who was most liberal in his payments to the judge. The revenue of the inhabitants is derived from land, and the assessment was based on surveys made by the aid of fraudulent measuring rods supplied for the purpose, and which being too short produced excessive areas. When land was taken for any public purpose no deduction was made; the fellah continued to pay on the former area. There was another imposition connected with surveying, for "sham surveyors used to go about the country armed with measuring rods, representing themselves to be Government employés, and would only leave each village on the payment of a liberal *douceur*, for the villagers stood in great dread of these pirates." The surveyor's art is believed to have had its origin in Egypt, and long practice enabled the representatives of the ancient geometers to make more profit out of it than is now possible in England. But of all forms of oppression the *corvée*, or forced labour, was performed on the largest scale. It also could claim to have the sanction of ages, and a scene which Mr. VILLIERS STUART observed in 1883 did not, we suppose, differ much

from what was practised in Egypt three or four thousand years back, and represented by contemporary artists :—

Wishing to witness with my own eyes the forced labour system in operation, I went to a place opposite the village of Ouled Ammer, where a new canal was being excavated.

A cut about 18 feet deep had been made through a conglomerate of sand and gravel; this trench was flanked right and left by high embankments, consisting of the *débris* excavated. From the summit of these ridges to the floor of the canal was from 35 to 40 feet deep; along the bottom and on the slopes right and left men swarmed thickly, like bees on a honeycomb, for a distance of about a mile in length. The overseer told me that the entire forced labour of the province was concentrated there, 40,000 men in all; that they worked from sunrise to sunset without intermission, except a brief interval at midday for a meal consisting of bread soaked in unfiltered Nile water. This bread was sent them by their relatives, and they had a meal of it before commencing work and another at night. They have also to provide their own baskets for carrying the excavated soil; they were engaged in filling these baskets with gravel (using their fingers for the purpose), climbing the sides of the cut and tipping them on the outer slope. The majority had no implements but their hands; a limited number had short picks a foot long, which they also have to provide, Government contributing nothing whatever.

The day was excessively hot, and not a breath of wind. The temperature in my cabin, with all windows open, was 82 degs. in the shade; at the bottom of that trench it was much hotter, I should estimate it at 95 degs. There was absolutely no shade. In this fiery heat and glare and amid much dust they toiled all day long. They were clad in calico, mostly reduced to rags by the work they were engaged in. They wore on their heads felt skull caps exactly like those represented as worn by workmen in Fourth Dynasty bas-reliefs. They were barefooted. Their calico rags formed their only covering at night, and they slept on the bare ground in the open air without any kind of shelter, although the nights are often very cold. Amongst them were many overseers armed with sticks, with which they often struck the men while carrying loads on their heads, without any apparent reason. Many had sore fingers and sore feet, for there were sharp flints amongst the *débris*.

I have seen negro slaves at work on the cotton plantations of Cuba, I have also seen the convicts at work at Portland; the conditions under which all these laboured were greatly preferable to those to which these Egyptian fellahs were exposed, and it must be remembered that most of them own farms, and constitute, in fact, the yeomanry of Upper Egypt.

What struck me most as I gazed on the toiling multitude was the pitiable waste of human labour, for one-fourth the number, with proper tools and appliances and sufficient food, and with intelligent and experienced foremen to direct them, could have done the work far better and more quickly than the ill-directed efforts of that mob of men without implements, weak from scanty diet and exhausted by hardship. An English navy would laugh at their work as excavators, but the conditions as to food, temperature and exposure under which they work would kill him long before the month was out. Ophthalmia is one evil that results. I cannot imagine a better recipe for the wholesale manufacture of this malady than to work men to exhaustion in fiery heat, glare and dust all day, and then to expose them all night to the heavy dew and frosty temperature, lying on the bare ground in their calico dresses.

It must not be supposed that because the Government pay nothing for it that therefore forced labour, as now conducted, is cheap. On the contrary, it is most costly to the country; every man there withdrawn from the cultivation of his farm represents a family by so much impoverished.

Under English rule forced labour is restricted to the watching of canal embankments during the few weeks when the Nile is fullest and it is necessary to provide against breaches of the embankments. In the sugar factories the labour during three months was also forced and unpaid. Now the labour is voluntary, and is well rewarded.

Although reforms are carried out which have made the people less miserable, there is much to be done which is outside the province of Government. The usurer flourishes in Egypt, and there is no competition to moderate his demands. If banks could be established that charged only 12 per cent. they would be boons, but we suppose financiers are afraid to trust the security. All over Egypt the cry is also for water; if it were abundant and obtainable when needed the usurers could be endured. When the water is shallow in depth it evaporises, and leaves a salty residuum which is most injurious to vegetation. Large reservoirs are costly. One at Wady Rayan would be likely to require an outlay of 3,000,000*l.*, but the return would be 70 per cent. In Upper Egypt there is soil many yards deep, but owing to the defective irrigation only a single crop a year can be derived from it. What is feasible can be seen in the Island of Elephantine. Mr. VILLIERS-STUART says he remembers when it was a desert; now it is covered with gardens and cultivation. But a few figures are more convincing about the future of Egypt when irrigation is undertaken on a

suitable scale than any words. Mr. VILLIERS-STUART summarises his conclusions as follows :—

The area of cultivation in Middle and Upper Egypt together may be put roughly at 2,500,000 acres. It is calculated that a perfect system of irrigation as planned by our engineers would result in raising the average selling price of the land from 33,000,000*l.* to 79,000,000*l.*, i.e. its value would be increased 46,000,000*l.*; besides that extensive tracts now desert would be reclaimed and rendered fertile. Its letting value would be raised from 5,000,000*l.* to 9,000,000*l.*; the value of the annual yield from 8,000,000*l.* to 18,000,000*l.* These are magnificent returns on an outlay of, say, 10,000,000*l.*, or even more.

The present area of cultivation in the Delta is about 2,750,000 acres. It is estimated that there are about 500,000 acres which could be reclaimed with improved irrigation. The increased annual value of the products of these lands, when the irrigation works are completed, is estimated at 3,000,000*l.* per annum. The increase in the Delta must of course be far less in proportion than in Upper Egypt, because the Delta already produces as a rule two or three crops in the year, whereas Upper Egypt as a rule produces only one now, but would then be enabled to raise two or three.

A loan of 10,000,000*l.* would enable these splendid results to be achieved. Such a loan for so excellent a purpose would be readily advanced by the bourses of Europe, but here our international entanglements interfere, and the best interests of Egypt are sacrificed.

It is unfortunate that, while the English authorities have contrived to put down so many abuses, they are powerless before the vandals. According to Mr. VILLIERS-STUART there is a "carnival of destruction" going on along the Nile in Upper Egypt. In all his experience of the country he never found the havoc which now prevails. In one place he saw "whole terraces of tombs being blasted with gunpowder, and counted six native freight boats in the act of being loaded with the stone thus obtained; equally good stone in every respect could have been blasted from the rocks close by, where there were no tombs." The Museum authorities are worse than the old tomb robbers, for the latter left the sarcophaguses as they were found, and contented themselves with the contents, but the official guardians of antiquities not only despoil the shrines, but smash them, regardless of their artistic character. In the historically interesting temple of Queen Ha to Son, at Deir-el-Bahari, of the Thebaid the upper terraces which gave it its artistic character, and were covered with sculptured panels admirably executed, have been utterly wrecked, and the sculptures which formed the breastwork of the terraces have been abstracted. Nor is the havoc less deplorable in the case of the tombs with which the hills in the neighbourhood are honeycombed. A well-known one, depicting the visit of a Soudanese queen to a king of the eighteenth dynasty in a series of tableaux, is now used to stable donkeys, and is in a filthy condition.

It is a maxim in mechanics that no chain is stronger than its weakest link. A Government ought not perhaps to be judged in a similar way. But the unrepressed vandalism will by many be taken as significant of British rule, and from such data it will be concluded that the so-called progress is only of a class with the vaunted care of antiquities which year after year is announced from Cairo.

SOCIETY OF ARCHITECTS.

THE ninth ordinary meeting of the Society of Architects for the session 1894-95 was held on Saturday, June 15, at Darenth, on the site of the Roman Villa, Mr. E. J. Hamilton presiding. The general business was gone through, and Mr. C. R. Scott, of Park House, Cambridge, was elected a member.

Mr. George Payne, F.S.A., gave an animated and learned address on the discovery and importance of the remains of the Roman Villa. In the course of this address he mentioned that discoveries had been made in the Darenth Villa which had opened the eyes of archaeologists, and would be handed down from history to history and from handbook to handbook.

Mr. E. J. Hamilton, president, proposed a very hearty vote of thanks to Mr. Payne for his very interesting address. This was seconded by Mr. H. Lovegrove, A.R.I.B.A., and unanimously carried.

The members of the Society then visited the parish church of Darenth, itself of considerable interest, being almost entirely built out of the remains of the Roman Villa, and possessing a curious font. The visit was a great success, and of the highest interest to architects.

Mar Lodge, the seat of the Duke of Fife, near Braemar, was destroyed by fire on Friday last. With a less scanty water supply some of the buildings might have been saved.

PRESERVATION OF WESTMINSTER ABBEY.

WE understand, says the *Times*, that the negotiations for acquiring the houses in Old Palace Yard, the removal of which was unanimously recommended by the Royal Commission on Westminster Abbey, on the ground that they "not only conceal to a great extent the architecture of the Chapel of Henry VII. and the ancient chapter-house, but are also a constant source of danger to the abbey from fire," are now on the verge of completion. The price to be paid to the Ecclesiastical Commissioners for the freehold was agreed upon some months ago; and the only leaseholder who was unwilling to dispose of his interest on the terms proposed has consented to refer the matter to an arbitrator. According to the present outlook, the authorities will be in a position to begin operations before the end of the present month; but, as it is undesirable that the work of demolition should be entered upon while Parliament is sitting, things will probably be left as they are until later in the year—probably until the period when men engaged in the building trade are most in need of employment.

As soon as the houses have been removed, the space cleared will be turfed over, so that the public may be enabled to view Henry VII.'s Chapel and the chapter-house under favourable conditions, and to form an opinion as to the advisability of utilising a portion of this space for the erection of a monumental chapel, as Mr. Yates Thompson suggests. In view of the fact that one-half of the Royal Commission were in favour of the alternative site by the cloisters (where the refectory formerly stood), it is obvious that the Office of Works will need more guidance before entertaining any extensive building scheme. The purchase-money and costs connected with the acquisition of the houses in Old Palace Yard is provided for in the Civil Service Estimates (class 1, vote 9), so that members of Parliament have had every opportunity for criticising the action of the Department. The sum proposed to be allocated this session is 27,000*l*.

ITALIAN ALABASTER WORK.

THE consul at Leghorn says he is obliged to warn English travellers to exercise great caution in their dealings with the alabaster shops of Pisa. The unbusinesslike habits of some of the proprietors lead to numerous irregularities, as is evidenced by the complaints which are addressed to the consulate by travellers on their return home. In some cases goods of a smaller size than those ordered are sent forward; in others, where a large order has been given, articles are missing; often months seem to elapse before goods offered are sent off, and a remonstrance from the consulate has been necessary to secure their final despatch. Doubtless abuses of the kind are more common than appears, for it is likely enough that only a small proportion of the sufferers lodge their complaints at the consulate. Travellers should, if possible, see the goods they order packed before they leave Pisa, and they should carefully ascertain by what route, and when, it is proposed to send them. One form of complaint that reaches the consulate is the very heavy forwarding charges which have to be paid on arrival of the cases in England. A gentleman living in the midland counties bought 14*l*. worth of alabaster statuary in February 1894, paying for his purchases on the spot. Even after several months had passed the goods did not arrive, and his letters to the dealers remained unanswered. A remonstrance from the consulate caused the goods to be sent off, and they arrived six months after the date of purchase, but with a sum of over 5*l*. to pay for forwarding expenses. Nearly 5*l*. of this amount was "charged forward" from Leghorn, and it was admitted by the London receiver to be excessive. In another case 3*l*. worth of goods had been ordered for a charity bazaar, and the forwarding expenses amounted to 5*l*. Travellers should try and ascertain the names of really reliable forwarding agents in Leghorn, and insist upon their purchases being forwarded by the agents of their own choice and not the agent patronised by the dealer. It is to be hoped, however, that proprietors of shops may speedily come to realise that only by promptitude, punctuality and scrupulous straightforwardness in their dealings can they hope to secure an English *clientèle* of any magnitude or importance.

Alabaster is now used in the manufacture of a new and much-needed article, viz. bell-pushes, a factory for making which has lately been set up at Pomaia. The alabaster bell-push is an extremely neat and serviceable article. It is made from fine Castellina alabaster. The alabaster blocks are first sawn into slabs, and from each slab ten or a dozen pushes are made by the application of a lathe. The pushes, after being turned, are subjected to a heating process, which gives them resisting power, and then to submersion in cold water, which tends to consolidate the stone. They then receive the artificial polish of soap and bone-dust applied to articles of the Volterra miscellaneous alabaster industry. One workman produces about 500 pushes in a day. The wholesale price is the extremely low figure of 15 c. (less than 1½*d*).

THE PROPOSED WESTMINSTER CATHEDRAL.

THE official appeal for funds for the cathedral at Westminster, of which the first stone will be laid on the 29th inst., states that at first it was proposed to reproduce the ancient basilica of St. Peter. This idea has been abandoned as impracticable. Mr. Bentley, the architect, after spending three months on the Continent, has given a ground plan which has been warmly approved by the Chapter of Westminster and by all who have studied it. The building will be of vast and stately proportions, perfectly suited to modern requirements, but not of a costly design. The object is a practical one: to provide, as Cardinal Manning said, what "is urgently needed in this great city," not to raise such an edifice as would be beyond all the circumstances and the condition of the Catholic Church in England. Mr. Bentley's plan covers 54,000 square feet. The cathedral will be 350 feet long, 156 feet wide and 90 feet high. The nave will be 240 feet in length, will be 60 feet of clear width, and there will be transepts, aisles and side chapels. In the apse, the floor of which will be raised some feet above the level of the nave, will be the monks' choir, as in Sant' Ambrogio of Milan, visible from the main entrance. The canons' stalls will be in the sanctuary. A figure of Christ crucified over the high altar will be the central feature to rivet attention. The style is Byzantine, like that of Sant' Ambrogio, with certain details suggested by San Marco of Venice and San Vitale of Ravenna. The characteristic of the building will be the great open space of the nave and transepts. For obvious reasons it has been decided to avoid any appearance of rivalry with the neighbouring minster. The quantities have not yet been taken out. The cost of the structure may be 150,000*l*.

ARCHÆOLOGY OF THE WITHERNSEA DISTRICT.

THE second excursion of the East Riding Antiquarian Society took place on Monday. The place of rendezvous was Withersea, where about forty members of the society assembled. Withersea is about the centre of that part of the coast which has suffered most from the inroads of the sea. Old Yorkshire maps used to bear the impressive words, "Here stood Awburn, which was washed away by the sea," "Hyde, lost in the sea," &c., and the devastation was reckoned to be going on at the rate of a yard a year. Very interesting it would have been to observe the old landmarks, for it is said that part of old Kilnsea Church is visible at extreme low water, and many can recollect the now defunct village of Owthorne, the last gravestone of whose churchyard may still be seen bearing the somewhat inappropriate inscription that the body below would lie there till the judgment day. Little was it surmised that one and all the bodies of that churchyard would be floated out to sea, and lie at the bottom of the ocean. Not much time was spent by the sea, the first visit paid being to Welwick Church, which was described by Mr. J. R. Boyle, F.S.A. It seems from Domesday that a church stood there at the Conquest. Leaving Welwick, the next visit was paid to the Pride of Holderness, as Patrington Church has been called. The place derives its name from St. Patrick, a sure sign of its having been Church property in early times, when the obligations of Yorkshire to the Irish saint were willingly acknowledged. The Easter Sepulchre in this church is one of the finest left in England. From Patrington the party proceeded to Winestead, the features of the church being given in a paper by Mr. Temple Moore, and dealt entirely with the architectural features of the place. The next meeting of the society will be at Scarborough Hall, on July 15. Lord Hotham has permitted some mounds to be uncovered which are believed to be the burying-places of a tribe about whom very little is known.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE members of this Society have made quite a new and attractive departure. In addition to the valuable and instructive lectures, they have commenced a series of excursions to places of historic interest in the neighbourhood. Through the good offices of Mr. Benjamin Bagshawe (lay member) they were permitted by his Grace the Duke of Devonshire to go through Hardwick Hall. The party left Sheffield at 9.45, and on arriving at Heath were conveyed in carriages to the hall. There were present Mr. Charles Hadfield (president), Mr. C. J. Innocent (hon. secretary), Messrs. B. Bagshawe, E. M. Gibbs, J. Smith, T. Winder, H. W. Lockwood, T. H. Waterhouse, J. P., F. Ward, J. T. Cook, C. F. Longdon, J. B. Mitchell-Withers, J. E. Benton, J. Norton, C. B. Flockton, H. Webster, W. F. Hemsell, F. Callis, C. Gibson, C. F. Innocent, R. J. Wigfull, H. Dawson, E. C. Skill, T. Whyles, O. Bromley, C. Ellis, G. E. Turner, S. L. Chipling, F. Wilson, F. Barker, G. F. Davy, J. C. A. Teather, J. V. Woofindin, S. Bonney

(Melbourne), J. Haigh (Holmfirth), and C. Goodier. The party assembled in the great hall at Hardwick at 12.45, and under the guidance of Mr. Bagshawe were conducted through the house. For many years Mr. Bagshawe has been a student of the hall and its contents, has been allowed to examine its muniments and everything that can throw any light on its history, and his explanations, historical and descriptive, of the building and of the many objects of interest which it contains were greatly appreciated by the members. Mr. Bagshawe pointed out various objects especially deserving attention among the pictures, the furniture, the tapestry, &c., calling notice particularly to the portrait of Lady Grace Talbot, which, in his opinion, contained a representation of the ancient gateway leading to the castle in Sheffield; and also to the portraits which have been misdescribed as the Earl and Countess of Shrewsbury. They were evidently intended to represent the father and mother of Lady Arabella Stuart. Mr. Bagshawe also exhibited to the members the accounts kept by the Countess of Shrewsbury of the furnishing of the hall—the cost of the various articles, even to the brass candlesticks now on the walls, and the names of the persons who supplied them—the whole written in a bold masculine hand. He pointed out that the character of this remarkable lady had been greatly misrepresented by historians, including the Rev. Joseph Hunter. From a careful investigation of books and papers, he had come to the conclusion that in addition to her great capacity for business she was generous, and a woman of strong natural affections; and that in the disputes which had arisen between her and her husband, the balance of evidence tended to show that he was wrong and she was right. Before leaving the long hall, with its unique collection of historic portraits, Mr. Bagshawe was, on the motion of the president, seconded by Mr. Innocent, and supported by Mr. Gibbs, cordially thanked for his kindness in having obtained permission for the visit, and for having accompanied the members, and the vote was acknowledged. The party were taken through the gardens, and before leaving the grounds Mr. Bagshawe proposed that their thanks should be given to the Duke of Devonshire, and the motion was seconded by Mr. F. Ward, supported by Mr. T. H. Waterhouse, and carried with acclamation. Tea was partaken of at the Hardwick Inn, and before leaving for the station Mr. C. J. Innocent was very cordially thanked for the admirable manner in which all the arrangements had been carried out, and which had contributed so much to the pleasure of the excursion.

TESSERÆ.

Stained-glass and Gothic Architecture.

IT may be admitted that Gothic picture glass-paintings, as well as pattern glass-paintings, harmonise with the contemporary sculpture in the form of their foliated ornaments, and many other details of strictly conventional character, and that they harmonise with the sombreness of the architecture and gloom of the building in which they are placed, in the cold tone, simplicity and intensity of their colouring or hue. Thus we find that all Gothic glass-paintings earlier than the last quarter of the fifteenth century are more or less cold in tone, the coldest, in general, being the earliest, when Gothic architecture was the most sombre in effect, and that we never meet with anything approaching warmth of tone until sombreness in Gothic architecture had nearly disappeared. We also observe that the earliest of the glass-paintings, whether white patterns or richly-coloured picture glass-paintings, are invariably deeper in hue or colour than the later examples, which are contemporary with a lighter style of Gothic architecture; and, moreover, that the principle of colouring displayed in the earlier examples is more simple, and therefore more solemn and grave, than that followed in the later ones. For instance, a light tinted effect, such as a late fifteenth or sixteenth-century landscape background has, is never seen in an Early English or Decorated picture glass-painting. Accident rather than design seems to have caused these progressive changes in the character and aspect of glass paintings, but it is unnecessary for the present purpose to seek to account for them. On the other hand, Gothic picture glass-paintings cannot be considered to harmonise with Gothic architecture or sculpture, either in their want of perspective and relief, or in their rendering of the human figure. If there is an excellence which Gothic architecture and sculpture possess in an eminent degree it is the relief produced by light and shade. Every sculptured ornament is so well relieved, that when seen under even the diffused light common to a northern climate, it appears prominent and distinct. Confusion of parts is a fault rarely met with in the most elaborate sculpture. Each ornament, in general, tells its own story when seen from the point of view which the spectator would naturally select. Mere surface decoration, to which Gothic glass-paintings bear a close analogy (such, for instance, as that which covers the spandrels of the choir arches of Westminster Abbey), is with exquisite judgment kept

comparatively flat, in order that the eye may not be distracted from the contemplation of other objects, which by their greater relief, as well as by their superior size, are rendered more important. But when we turn to a Gothic picture glass-painting, we meet with a display of diametrically opposite qualities—instead of relief we find flatness, and consequently confusion instead of distinctness. Indeed the contrast is so striking that we are tempted to inquire whether the artist really intended to produce anything beyond an harmonious arrangement of brilliant tints. It has often been asserted that, because Gothic glass-paintings are in unison with the illuminated MSS., and, like them, display many beauties of execution, such as feeling and high and delicate finish, that we are therefore to regard as intentional any defect in drawing, perspective or relief, since it is not to be supposed that artists possessing the skill which the Mediæval artists display in other respects could have been ignorant of these elements of art. But it has been answered with great force, that if perspective and the principles of correct drawing were found in some branches of Mediæval art, there would be some reason for supposing that they were excluded from others deliberately, and with a knowledge of their existence; but if they are universally absent, the inference is that they were universally unknown, and that, as nothing is more certain than that considerable acquaintance with some branches of artistic knowledge is compatible with ignorance in others, the argument drawn from the skill and finish displayed in many Mediæval works really amounts to nothing.

Norman Castles.

In the construction of a castle no ordinary skill was required. The subsistence and comfort of those who were enclosed within it were not less to be provided for by the architect than mere defence, or the devices by which the assailants might be misled or defeated. Most of the keeps had four distinct storeys, and the walls were not unfrequently from 12 to 20 feet thick at the base. In the souterrain of vaulted stone the military engines and stores were deposited. In the thickness of the walls were placed winding staircases, the well for water, the vast oven, enclosed galleries and chimneys, with an aperture open to the sky, and communicating with the dungeon in which prisoners were confined, and to whom it gave all the light and air they could receive. There was likewise a kind of flue for conveying sound to every part, not more than 8 inches in diameter. The state apartment occupied the whole third storey, and the staircases leading to it were made much more commodiously than the others, some of which were even large enough to admit military engines. Adjoining to the great chamber was an oratory. In Rochester Castle the chief room was 32 feet high, including the whole space within the walls. Suits of arras were suspended from the circular arch which supported the roof to make separate apartments, and attached against the walls as furniture. In the ground floor there was no light; loopholes only were allowed in the second; but in the third were three large round-arched windows, placed high, so as not to be looked through, and so defended by an internal arcade that no missile weapon could enter or fall with effect. Each floor had its communication with the well. The chimneys were very capacious and projected considerably into the rooms, resting upon small pillars, and the sinks were so contrived in an oblique direction that no weapon could be sent up them. Gundulph is said to have introduced the architectural ornaments of the Norman style into castles, both within and without. A large sculptured portal and windows, similar to those used in ecclesiastical buildings, appear in most of them. Castle-Rising, Norfolk, and Norwich abound in admirable specimens of Norman arcades and mouldings. In the circular or oval keeps, which usually occupied the whole area of the mount on which they stood, a richly-carved doorcase is to be discovered. They are still remaining at Arundel and Berkeley. The great tower of entrance was built at the foot of the artificial mount, from which was a sally-port with stone stairs leading to the keep. It contained the portcullis and drawbridge affixed to the archway and several spacious chambers. In point both of the formation of the mount and keep and their connection with the entrance-tower, the remains of Tunbridge and the more perfect state of Arundel Castle exhibit a singular resemblance. The walls were protected by very substantial ribs or buttresses, and the round keeps had a central space left open to admit the light and air. At Arundel the corbel-stones which supported the beams of timber, and which converged to an open centre, where was a subterraneous room, are still easy to be marked out.

Inlaid Work in Marble and Pietra Dura.

In ancient buildings marble was extensively used, and as, even in Italy, the finer kinds are rare, and consequently expensive, it was usual to cut the fine blocks into thin plates or veneers, and coat the inferior kinds with them. The halls of the public buildings and palaces were also floored with different kinds of marble cut into dice, or lozenge-shaped pieces, and arranged in geometrical patterns, to which the name

tesserae was applied by the Romans. This kind of work constituted originally the *opus musivum*, or mosaic, of the ancients; but gradually, instead of merely incrusting the walls with marble of one colour, or making simple geometrical figures of two or more differently coloured marbles, figures of trees, birds and other animals were cut out of them, and inlaid in a slab of some other variety of marble. This kind of mosaic was brought to great perfection by the Italians during the fourteenth, fifteenth and sixteenth centuries, especially at Florence. The Florentines, however, only used marble as the matrix, the substance inlaid being jasper, cornelian, different varieties of agates, chalcedony, amethyst, the half-opal, noble serpentine and other pseudo gems, and even Labrador felspar (which, as is well known, has a *chatoyant* lustre), lapis-lazuli, malachite (native carbonate of copper), &c. To produce work of this kind a well-polished slab of marble of the required form and size, and from an eighth to three-sixteenths of an inch thick, was prepared. Upon this the pattern was drawn and then cut out; the stones to be inlaid were then cut by the lapidary's wheel, as in ordinary gem setting, to the size of the pattern, and cemented into their places fully polished; for, if finished off when inlaid, great inequalities would be produced by the unequal wearing of the different stones, in consequence of having different degrees of hardness, especially where malachite and lapis-lazuli are employed. The slab thus made was veneered upon another and thicker slab of marble or wood, according to the object intended to be made. Instead of inlaying marble, ivory is sometimes inlaid in this way. The kind of work just described is known as *pietra dura*, or true Florentine mosaic, imitations of which are now commonly made in different parts of Europe; but instead of pseudo gems, different coloured marbles, glass, malachite, &c., are employed. Besides a number of objects inlaid with regular patterns, a great many tables are inlaid with *tesserae*, arranged in geometrical figures, or as chessboards. Sometimes table tops are made of a number of pieces of determinate figure, but all more or less different, and sometimes of unequal size. These are known as scrap tables, and are about the most tasteless and absurd productions upon which money and time can be squandered. Another class of this latter species consists of cementing a number of irregularly formed pieces of marble together and then polishing the compound, which is veneered upon a slab of slate or marble. This species of work is not, properly speaking, mosaic, but rather a sort of artificial pudding stone or brecciated marble; it is difficult to say which is the most tasteless. There is a further kind of mosaic of a most remarkable character, made of glass, and known as Roman mosaic.

The Apollo Belvedere.

The statue of Luni marble in the Vatican, known as the Apollo Belvedere, was found towards the close of the fifteenth century, among the ruins of Antium, on the sea-coast. Julius II., whilst a cardinal, purchased it, and retained it in his Palazzo Colonna, near the church of SS. Apostoli. It was afterwards transferred by this pontiff to the Belvedere of the Vatican; hence the name. This statue was engraved by one of the Marc Antonio school, in the time of the great Raphael. The mutilations of the figure are shown in the print. M. Visconti produced a certificate attested by many professional judges that the marble is not Luni or Carrara; when the statue was in Paris, the most experienced mineralogists pronounced it to be unlike any Greek marble they were acquainted with. No statue has commanded such universal admiration among artists, and notwithstanding the discussions raised with regard to its originality, all seem to recognise and acknowledge the excellence of the first conception. The fiery animation of the countenance, and the snaky treatment of the hair, point very strongly to the age of Lysippus, and favour the supposition that it is an excellent copy executed in the Augustan age. German critics go so far as to perceive in the countenance evident traces of the features of Nero. The remarkable breadth of nose seems the only circumstance in their favour. Whenever Nero appears in the character of any of the deities, his peculiar fashion of wearing the hair is always the same. The original statue is admirably placed in the Vatican in front of a niche of grey marble, and in a separate building from the rest of the sculptures. The son of Latona has just discharged the fatal arrow against the serpent Python. The bow still remains in his firm left hand, and the god appears to be watching the effect of his vengeance. Indignation is expressed in his countenance, especially by the dilated nostril and the curled lip. The eye seems starting, and the hair, light and flowing, contributes powerfully to the expression. It is bound by a band or strophium, and gathered in a knot over the forehead, as seen in many statues of Apollo and Diana. A quiver hangs at his right shoulder, and his feet are adorned with rich sandals. His mantle or chlamys is fastened on his right shoulder. It falls chiefly on his left side, and is thrown over that arm so as to display both his form and action with the utmost grace. A feeling of perpetual youth pervades the whole figure, and at the first glance vigour, agility and elegance, com-

bined with a noble expression of indignation, impress the beholder. The trunk of the tree seems allusive to the ancient olive of Delos, and the serpent twining round it is the emblem of health and medicine, of which he was the presiding genius. It may, therefore, have been the statue described by Pausanias, dedicated to the god in his medical capacity after the plague at Athens. It is most probably a copy from a bronze; the treatment and elaborate execution of the hair could not have been devised for a marble statue; the drapery hanging from the left arm confirms this opinion. It represents a single piece of stuff forming loose folds, which should correspond on both sides; but this is not the case. The sculptor did not venture, on account of the thinness of the marble, to follow the original in this respect, although in the bronze itself nothing can have been easier. It is most likely a first-rate copy executed in the Augustan age. Flaxman remarks:—"The energetic Apollo Alexicacos, or the Driver away of Evil (commonly called Belvedere), is 'severe in youthful beauty'; he supplies Homer's description to the sight—his golden locks are agitated, his countenance is indignant—the quiver is hanging on his shoulder, and he steps forward in the discharge of his arrow." Again, in comparison, he says:—"The boundaries of personal beauty are the Apollo and Hercules; a more slender form than the Apollo is *maigre*, and one more covered with flesh than the Hercules must be clumsy; as one in which the parts are more forcibly marked than in the Laocoon would be a dissected figure." The entire right forearm and left hand were restored by Montorsolo, a pupil of Michel Angelo.

Paolo Uccello.

The laws of perspective, the discovery of which was the most important scientific discovery relating to composition ever made, were first brought into application by Paolo Mazzochi, surnamed Uccello from his skill in painting birds. He was born at Florence in 1349, and was much assisted in his studies in perspective, to which he devoted himself with great ardour, by Giovanni Manetti, a celebrated mathematician of the time. In turning over the engravings from the Campo Santo we immediately perceive the vast superiority in the compositions of Gozzoli over those of the earlier painters, the result almost entirely of his knowledge of perspective. Gozzoli was half a century later than Uccello, and was instructed in this new art by his master Angelico. Among the other defects arising from unacquaintance with perspective, we may observe that the painters before Angelico gave to the glories round the heads of their saints the form of a round dish at the back of the head, or, if the face was in profile, attached to the cheek farthest from the spectator. In the pictures of Angelico we see these halos, for the first time, beautifully put in perspective, as we see them, when they were afterwards reduced to faint rings, in the cartoons of Raphael. The compositions of Gozzoli in the Campo Santo are very numerous and full of material, displaying great observation of nature and much taste. It is impossible not to admire the richness and splendour of his architectural backgrounds, though they are sometimes over profuse in ornament; but the extensive picture which concludes the history of Joseph can scarcely be praised enough. The architecture shares our admiration perhaps too equally with the groups, but it is so very beautiful that we are forced to forgive this. No story was ever more naturally told, nor grouping more unaffectedly simple. As was the practice in early art, several points of time are united in one composition, and Joseph appears in three different places; but what is most remarkable is that Gozzoli has adopted three different vanishing points in the perspective. The entire composition is, however, so harmonious that this violation of rule does not strike the spectator at the first glance, and if it be excusable, the apology is to be found in the fact that if but one vanishing point, and which must have been the central one only, had been used, the openings which show the sky and trees and a distant dome must have been shut out, and much that is beautiful consequently lost. Not that these excuses should constitute a precedent, for it is always in the power of the painter to adopt an arrangement that needs them not. But the example of Masaccio in the treatment of architecture with reference to figures is perhaps a better one, and in this he is sometimes to be preferred even to Raphael, for in the engravings I have seen from his works at Florence his backgrounds are always in strict subordination to the figures. All these painters, and indeed all before Leonardo da Vinci, gave the costume of the ages in which they lived to whatever subjects they painted, hence their pictures have an antiquarian interest to us not thought of by themselves.

The Commission charged with the organisation of the dramatic and musical performances in the old Roman Theatre of Orange includes among its members MM. Formigé and Garnier, architects, Injalbert, sculptor, and Benjamin Constant, painter.

NOTES AND COMMENTS.

It is politic to decry the State and municipal architectural departments in America, for without them an enormous amount of practice would be obtainable by architects. According to a New York paper one architect was fortunate enough to receive 22,283 dols. commission on fire brigade houses, stables and police stations. The total sums paid in commissions for fire and police stations was 240,000 dols. Economists—and in the United States they usually mean gentlemen whose friends are not in office—contrast the outlay with that of the Architectural Department of the Education Board, which altogether amounted to 9,500 dols. The chief architect, who designed and superintended the construction of a high school and thirteen other buildings, received out of that sum 2,600 dols. It is most unjust that an able architect should be so meanly rewarded, and for the sake of justice the crusade against architectural departments is justifiable.

THE marble industry in the Massa-Carrara district, it appears, has suffered to a great extent by the political troubles that took place in the Lunigiana in February, 1894. For nearly a month all work was practically at a standstill. The country was placed under martial law. When order was re-established, an inquiry into the grievances of the quarrymen led to the adoption of several remedial measures, including a general system of insurance of the working-men, a recognition of the employer's liability in cases of accident, and a general supervision of the quarries by skilled engineers, employed by the municipality, with the special object of preventing undue risk and loss of life. There was also over-production, and a continuous decline in prices caused by competition. This was especially felt in sawn and worked marble. In the latter, however, there seems to be a brighter outlook, and several large orders for architecture and sculpture have been received. Owing to high protective duties abroad, the depression in sawn marble continues, and many of the saw-mills have been closed. The prices for block marble are still as low as in 1893, but slab marble has seen further reduction. Statuary marble of the first quality has been scarce, and prices were consequently maintained. Few works of note have been executed during 1894. In the mountains above Castelpoggio, not far from Sarzana, there are several quarries of a very beautiful red and violet marble with white veins. It is, however, unsound and difficult to work. The British marble firms at Carrara are:—Messrs. WALTON & NEPHEW; B. FABRICOTTI; ANSELM, ODLING & SONS, Limited; C. DENHAM; J. ROBSON & SONS. At Massa:—The Massa-Carrara Marble Company; ARTHUR SENNETT.

THE doubts which have been excited by the frailty of buildings in New York could not escape the attention of insurance speculators. Collapse may be more profitable to them than fire, for, taking the average of even an American city, there are likely to be fewer losses. The *American Architect*, in writing on the subject, says:—"What may become a very important movement has been started in New York. It is well known that several buildings in and about that city have recently fallen down. The owners have been unable to collect indemnity from the insurance companies for their loss, for the simple reason that all New York fire insurance policies provide that the contract of insurance shall not apply to cases where the building, or any part of it, falls before taking fire; and some of them have been influential enough to procure the appointment of a committee of the Board of Trade, to confer with a similar committee of the fire underwriters on the matter. The conference resulted in showing that, under the State laws, fire insurance companies cannot insure against the fall of buildings, or pay losses caused by the fire after such a fall; and it seems probable that the demand for such insurance may cause the formation of new companies, organised expressly to furnish it. There is no doubt that the business would, at first, be profitable, for the contingency of the fall of a structure is an extremely remote one, and a small fraction of the rates charged for fire insurance would be amply sufficient to cover it. If, however, the practice of insuring in this way should become general, the

rates would fall, and the companies engaged in the business would naturally try to exert their united influence to improve the stability of ordinary construction. Such influence might hereafter become a powerful factor in the practice of building. Although the influence of the fire insurance companies on the art of construction has not been in all respects favourable, no one can deny that it has been very great, and a similar, or rather supplementary, influence exerted in favour of stable and rigid building ought to be useful. We presume that the day has gone by when an insurance company of the sort would favour bad construction, on the ground that an occasional collapse of a building was 'good for the business,' and that stability insurance would be managed as rationally as fire insurance now generally is. With that proviso the new movement is certainly to be encouraged."

MODELS are able to point to their counterfeit presentments in many guises. They are in such cases holding an official capacity. But as individuals they are not recognised by artists. Who can recall a portrait of a model in all the exhibitions of the Royal Academy, unless in a case where one of them marries well and poses as an amateur? Old Mother KRÜGERMANN, who as an antique goes before all of her class in Berlin, has had the distinction of having her portrait painted by Professor MENZEL, and it is to be seen in the Berlin Exhibition. She does not appear in character, but as she can be seen often in the streets, any one who wishes to see her in fancy dress has plenty of opportunities in the National and other public galleries. She is the ATROPOS in THUMANN'S *Parce*, and is about to cut the thin-spun thread; the Countess VOSS in HILDEBRAND'S *Flight of Queen Luise*; the serving-woman in KRAUS'S *Children's Party*. In both ancient and modern subjects she has taken her part on canvas. The old lady has passed her eighty-eighth birthday—for the portrait was painted as a memorial of the anniversary—but she is still hale and hearty, and ready to endure the painful toil of a model, which practice rarely lessens.

A MEETING of the Lancashire and Cheshire Associations of Baptist Churches was held on Wednesday, when a report on chapel building was considered. A committee had reported that it was altogether undesirable to set the pastor of a church the task of begging for his own chapel amongst the Association churches. It was recommended that there should be one fund raised by the associated churches, and known as the Association Fund; and that, from such fund, the needful expenditure both for home mission churches and the new chapel-building cases should be met. In order to raise this fund each church should be asked to contribute, at any rate, not less than the proportion of 7½ per cent. per year per hundred members. The Council suggested the appointment in every church of an Association representative, who should undertake the responsibility of superintending the collection of the moneys in his own church. The Council recommended that such fund should be devoted at the rate of not more than one-third to chapel-building cases, that subscribers should have the option of giving to either or both of the objects. To bring the scheme before all the churches and get it into working order, it was recommended that a dozen active members of the Association should be asked to undertake the organisation of the churches in the various districts. It was further recommended that not more than one chapel case in a year be adopted. The recommendation was adopted.

A DECISION has been given by the United States Attorney-General, which it is to be hoped may not be accepted in this country. Tenders were lately invited for the erection of buildings in the Navy Yard of New York. The lowest tender was accepted, but the builders declined to enter into the contract on the ground that an error arose in copying the estimates, and which was not detected in time. The Attorney-General was consulted, and he gave the opinion that a tender could only be withdrawn when an error was mutual, and that negligence on one side was not a sufficient ground. It is often inconvenient for a tenderer to withdraw, but the practice is generally tolerated in this country.

"THE BARBER SURGEONS," HOLBEIN.

MANY of our readers must have seen an engraving of a picture representing some barber surgeons on their knees before Henry VIII., and looking as uncomfortable as if they were the Calais hostages before Edward III. The picture should be transferred to one of the attics of the College of Surgeons. But with the cupidity which characterises the dealings of most of the City Companies, it is proposed to sell the picture, or, as it is expressed in the customary slang, the Barbers "would consent to receive 15,000*l.* for it." Some City gentlemen have accordingly issued the subjoined circular. As a picture it is vastly inferior to the *Ambassadors* in the National Gallery, and to be made out it will have to undergo a course of operations. Whether City Companies can sell inheritances is doubtful, but in this case the picture could be sent out of the country without any loss to a single surgeon or barber, unless they are of the nominal sort. Too much rubbish is already to be found in English galleries. The following is the circular:—

A public movement is on foot to secure from the Worshipful Company of Barbers the famous historical painting by Hans Holbein, representing the ceremony of the incorporation of the Guild of Barbers with the Guild of Surgeons by Henry VIII. in 1540, in order that the picture may be placed in the Permanent Art Gallery of the City of London at Guildhall.

For various reasons the Barbers' Company have been led to entertain the question of the picture leaving their hall, chief among these being—(a) The close proximity of the hall to the large Wood Street warehouses which crowd around it, and the consequent and constant danger of fire, from which so large and heavy an oak-panel picture could only be rescued with great difficulty, if at all. (b) the inability to properly see the picture (in its present ill-lighted situation) as well as it could be seen in an adequately-lighted gallery; (c) the opportunity which would thus be afforded to the company by an increase of its funds of extending its sphere of usefulness in the direction of charity and education.

In the event of this picture being placed in the open market, it would certainly realise a large sum, with the probable result of its leaving this country and passing either to some continental gallery or to America.

It is one of the earliest known paintings connected with the City of London, and represents an interesting historical incident in connection with two of its most ancient guilds. As such, it should not, in the opinion of many, be permitted to leave the precincts of the City.

A strenuous effort is, therefore, being organised to obtain the funds necessary to place a work of art so closely identified with the City of London in the Permanent Art Gallery at the Guildhall, which is daily open free to the public.

The picture is the largest that Holbein painted, being 6 feet high by 10 feet 3 inches wide, and contains eighteen life-size figures in addition to that of King Henry VIII.

On condition that the picture is secured to the Guildhall Gallery, the Barbers' Company would consent to receive 15,000*l.* for it, which sum would be handed intact to the company and be subject to no commission in any quarter.

We venture to express the hope that so desirable a project as that now submitted will be favourably considered, and receive your kind support.

STUART KNILL, Adelaide Buildings, London Bridge.

JOSEPH C. DIMSDALE, 50 Cornhill.

ALBERT G. SANDEMAN, Bank of England.

P.S.—Sir Joseph Dimsdale is acting as honorary treasurer to the fund, and it is requested that your reply to this communication may be addressed to him at 50 Cornhill.

DISCOVERIES AT SILCHESTER.

WE have already mentioned the discovery of a large mosaic at Silchester. According to the *Times*, the systematic excavation of a hitherto unexplored insula or square lying midway between the basilica and west gate was continued in May. This insula has been found to be almost entirely covered with the foundations of two very large houses, each of which had a courtyard facing north and entered from the main street on that side by a gateway of considerable importance. The easternmost house has a street frontage of more than 200 feet and extends backwards for over 150 feet.

Its principal chambers were on the west side and had mosaic floors, unhappily almost entirely destroyed. A vestibule in the north part of the house, about 12 feet wide and 50 feet long, has fortunately nearly the whole of a very remarkable mosaic pavement. It consists of a groundwork of common red and drab mosaic, arranged in long bands or panels, filled with squares or lozenges and coupled by frets. In this are set, in somewhat capricious fashion, no fewer than five, if not six, panels of fine mosaic work of excellent design. First, there are two small squares, each 2 feet across, placed side by side with an interval of a few inches. Then comes a large panel 6 feet square, with a bust (unfortunately much injured) within a circular border. Beyond this is a long and narrow panel of interlacing work, and beyond this again the remains of a fine panel (or perhaps two placed end to end) over 20 feet long, which has evidently been almost entirely destroyed within the last few years through the agency of a "scarifier." Very few instances of so elaborate a combination of coarse and fine mosaic patterns have come to light in Britain. The occurrence, therefore, of so curious and perfect an example at Silchester is noteworthy. At the west end of the vestibule is a small room on a lower level, with a very perfect floor of drab mosaic with a central panel of fine work, but this is injured in the centre. Against its east wall are the remains of a fireplace, a most uncommon feature in Romano-British houses. The other house is quite as extensive as the first. Its plan resembles that of most of the large houses found at Silchester, and of the principal Roman villas in this country, a series of chambers lined by corridors and arranged round three sides of a courtyard. Only the principal wing, that on the east, has as yet been completely uncovered, but in this, besides two rooms warmed by hypocausts, are no fewer than five other rooms, all of considerable size and with mosaic floors. The northernmost room has in the centre a large panel of fine mosaic, about 15 feet square, composed of five large circles within octagons, and filled with stars and geometrical figures, the whole being enclosed by a broad border of braidwork and set in a ground of red tesserae. The colours used are black, white, red and yellow. About three-fourths of this pavement is intact. The next room has an almost perfect mosaic pavement composed entirely of fine black and white tesserae arranged in eighty-one squares or panels of geometrical design coupled by fretwork. It measures about 14 feet by 16 feet, and is set in a ground of coarse red tesserae. The next room had a fine mosaic pavement of about the same size as that just described, composed of sixteen octagonal panels of black, white, red and yellow tesserae, but unfortunately almost the whole is destroyed. A passage paved with ordinary red tesserae separates the three northernmost chambers from the other two. One of these has a plain red pavement only. The southernmost chamber retains a nearly perfect mosaic centre, about 14 feet square, formed of nine hexagonal panels with floral and other devices, all of good design and character. Whether any other fine mosaics will be found in the other parts of the house remains to be seen, as at present only the lines of the walls have been traced. It is hoped that it will be found practicable to remove the better-preserved pavements to the Reading Museum, where the Silchester Loan Collection has been deposited by the Duke of Wellington.

ROYAL ARCHITECTURAL MUSEUM.

THE annual general meeting of this museum and the Westminster School of Art was held at the museum, Tufton Street, Dean's Yard, Westminster, on Friday. The Duke of Westminster occupied the chair, and among those present were Sir Arthur Blomfield, A.R.A., Sir W. E. de Souza, Mr. Aston Webb, Mr. C. F. Hayward, Mr. W. Pain, Mr. J. P. Seddon, Mr. W. C. Cocks and Mr. F. Ford (the secretary). The museum, which has occupied its present position for twenty-five years, formerly existed at Cannon Row, and is the only architectural museum of the kind in the Metropolis. The Council, in their report, expressed regret at the decease during the year of three of the vice-presidents of the institution—Viscount Harding, Sir E. A. H. Lechmere and Sir A. H. Layard—and also at the resignation of the Bishop of Ely from the position of president. Great satisfaction was expressed at the improved financial status of the institution, which was due to the popularity of the School of Art and to the grants received from the Technical Education Board of the London County Council. Sir A. Blomfield, in moving that the Duke of Westminster be elected the president of the institution, said he was glad to report that it was in a more flourishing condition than it had ever been before; but that, he said, was due rather to the success of the School of Art than to the support it had received from the members of the architectural profession, who, unhappily, had taken but little interest in the unique collection and casts which the museum possessed. The Duke of Westminster said he felt greatly honoured at being elected the president of so valuable and remarkable a museum and school of art.

EARLY MAPS OF LONDON.

THE paucity of topographical delineations of the ancient city of London is remarkable. The earliest extant is that of Anthony Van den Wyngrede, executed in 1543, the original of which is still preserved in the Bodleian Library. Little, however, is known of its author; by some authorities he is said to have been in the pay of Philip of Spain. This view is more valuable for its architectural details than for its topographical accuracy. It extends from Greenwich to Westminster. A reduced copy of it by N. Whittock is but a poor representation of the original, and, being a made-up plan, is of little value. The next view in point of date is that published by Braun and Hogenberg, in their work entitled "*Civitates Orbis Terrarum*," in 1572-73. George Braun wrote the geographical and topographical description, whilst Francis Hogenberg, with the aid of Simon Novelani and George Hoefnagel, engraved the maps. This is on a very small scale; it shows the cities of London and Westminster, from the slaughter-house at Millbank to the beer-house beyond St. Catherine's Hospital. On the southern bank of the Thames, the Roman manor of Paris Gardens and the position of the bull-ring and bear-pit are very clearly marked. It has the arms of Elizabeth in the left-hand tablet, and that of the City on the right. The State barge on the river proceeding to Westminster has the arms of the Queen upon the canopy, and the figures in the foreground are in the costume of that period. This, although small, exhibits much artistic skill, but for the following reasons cannot be classed among original surveys. It shows the old steeple of St. Paul's, which was destroyed by lightning in 1561, and never rebuilt. It cannot be supposed that for the purposes of Braun's work the whole of the cities of the world which are engraved therein were actually surveyed; indeed, the vastness of the labour and cost of such an undertaking would seem to render such a supposition incredible. It must have been compiled from some older surveys then existing. There is an entry of the publication of a "*Carde of London*," about the date 1562-63, to which Braun might have been indebted for his survey.

John Norden, in 1593, published in his "*Speculum Britanniae*" a view of London and one of Westminster. That of London extends from the Temple to St. Catherine's by the Tower; it measures 9 inches in length by 6 inches in breadth, and was engraved by Pieter Van den Keere. The arms of Elizabeth are shown in the tablet at the left-hand, and the City's in the right; around the margin are the arms of the twelve principal companies. As a specimen of the engraver's skill it is of considerable value, but it is too small to convey anything like an accurate topographical delineation of London at this period. The view of Westminster is from the Temple to Millbank; it is 9½ inches in length by 6 inches in breadth, and although small, is valuable in some respects, particularly as to the several buildings at Whitehall, the parks, water-courses, &c.

The next view of London in point of date is by Cornelius J. Vyscher, and is entitled "*Londinum florentissima Britanniae urbs toto orbe celeberrimum emporium*." It was published at Amsterdam in 1616. The view extends from the Palace of Whitehall westward to St. Catherine's Hospital eastward. It is a very fine specimen of the engraver's art. The theatres and bear-garden upon the banks are worthy of particular observation, and so are the timber houses leading to and on the bridge, viz. Nonsuch House and Southwark Gate Tower. The architectural details of many of the buildings too are most interesting, especially the water tower at Queenhithe, the Steel Yard, Coleharbour, Old St. Paul's, Baynard's Castle, Old Fishmongers' Hall, Winchester House, the tower of Bow Church, &c. A copy of this view in fine condition is preserved in the King's Library at the British Museum: along the top is the title, and at the bottom a long Latin inscription. It is printed on four sheets and measures 7 feet 1 inch in length and 1 foot 6½ inches in breadth; at the top are two figures, the one to the left has the arms of James on the flag; that to the right has the City of London. There is another copy of this edition in the Guildhall Library, wanting the title and the Latin inscription. The artist, although a pupil of the celebrated Peter Soutman, adopted a style of his own, which he carried to great perfection. Another copy which exists was evidently done some years subsequently, extending eastwards to Greenwich, but inferior both in execution and detail, although it bears Vyscher's name: from internal evidence it would seem to have been the work of some Dutch or German artist. The Palace at Whitehall is called "*Konig's Pallast*;" St. Dunstan's in the East, "*S. Dunston inde East*." In the print-room at the British Museum is a copy printed at Venice in 1629, but although this also has Vyscher's name, it is evidently only a bad imitation of his view.

The long view of London made and engraved by Wenceslaus Hollar, and published at Amsterdam in 1647, is a splendid specimen of the work of this master of copperplate engraving. The view extends from Whitehall to Greenwich, and measures in length 8 feet and in width 1 foot 6 inches. Hollar's view

has been the fruitful source from which several Dutch artists have taken their inspirations. Among these may be classed Johannes de Ram, Romboist Van den Hoeve and several others, and it is much to be regretted that they did not follow their copy, but in this they have signally failed. The towers of the churches and some of the public buildings have been made to assume most fantastic shapes. These views must be taken as apocryphal only.

The next in importance to Hollar is that of his pupil, Robert Pricke. It is entitled "*The South Prospect of the famous City of London*, being the Metropolitan of Great Britain," sketched and engraved by the author. The view is taken from St. Olave's Church, Southwark, and shows the tops of the buildings in the City; those, however, in Southwark leading to the bankside are very picturesque, and are good specimens of the timber houses of old London. The view extends from Baynard's Castle to Greenwich, and as a specimen of engraving it is only inferior to Hollar's large view, but it is a mere picture of London. This must not be confounded with a view of London after the Fire in 1667 by the same artist, the latter being a very poor production in comparison.

In 1658 Newcourt surveyed London. His survey was engraved by William Faithorne. This is valuable as showing the growth of London within a few years. It extends from Westminster to Limehouse. The architectural features are treated in a very stiff and conventional style, the growth of London both east and west being, however, a marked feature. The houses west of St. James's Park, Tart Hall and its surroundings, are curious. There is a small view which, from its general treatment, was probably done subsequently to this; it is entitled "*The Newest and Exactest Mapp of the most famous Citties, London and Westminster*, with their suburbs, &c., so that it is a ready help or guide to direct countrey men and strangers to find the nearest way from one place to another. By T. Porter. Printed and souled by Robert Walton, at the Globe and Compasses, on y^e north side of St. Paul's." It extends from Westminster to Limehouse, and north and south about as far as Newcourt's map. This was evidently engraved to fulfil to the letter the expressed purpose of its author, for all the streets, lanes, &c., are made much wider than they really were. The buildings and architecture are quite matters of secondary importance. It is 2 feet 6 inches in length by 11 inches in width; it has the arms of James I. on the left side, and those of the City, supported by two figures representing Justice and Prudence, on the right. It is most interesting in its details.

Hollar engraved a ground-plan of London previous to its destruction by fire, but on a very small scale, 11 inches in length by 7 inches in breadth; it was dedicated to Sir Robert Vyner, baronet and alderman, whose arms are engraved upon the margin, and who was Lord Mayor in 1653-54. Hollar subsequently designed a ground-plan of the City, to be finished in about four sheets. This was, however, never completed, although, from the following letter addressed by King Charles II. to the Lord Mayor, it would appear to have made considerable progress, but was standing still for want of funds. There is a letter from Charles I. to the Lord Mayor, in which the king recommends "*Wincellaus Hollar unto you and your Court of Aldermen*, that you and other well-disposed citizens by your example would become benefactors to him in such measure as may conveniently enable him to finish that exact delineation of our said city which he hath so ingeniously begun."

There is another view by the same artist taken after the Fire. It is entitled "*A Map or Ground-plot of the City of London and the Suburbs thereof*; that is to say, all which is within the jurisdiction of the Lord Mayor, showing the part destroyed by fire 1666; sould by John Overton at the White horse in little Brittain next doore to little S. Bartholomews Gate. 1666." This measures 13½ inches by 10½ inches, and extends from East Smithfield to Lincoln's Inn, the Temple, &c. This is far too small to be of any value, and no one can accept it as done from an actual survey; it is, in fact, a picture of the City in its desolation.

"An exact surveigh of the streets, lanes and churches comprehended within the ruines of the City of London, first described in six plats 10 December 1666, was prepared by order of the Corporation by John Leake, John Jennings, William Marr, William Leybourn, Thomas Streete, and Richard Shorlgrave, surveyors, and reduced into one entire plat by John Leake for the use of the commissioners for the regulation of streets, lanes, &c." This really gives an accurate delineation of the streets and lanes, &c., but nothing further.

Strange as it may seem, with the exception of the map attributed to Agas hereafter referred to, the foregoing are the only authentic views of London until after the Fire, and no ground-plan of any value anterior to that date has come down to our time.

Immediately after the Fire the two sworn surveyors, John Ogilby and William Morgan, who were officially engaged in

plotting out the disputed property in the City of London, surveyed the whole of the City and published their ground-plan in 1677. This work well deserves consideration; its accuracy has been so frequently tested that it is now referred to as an undoubted authority in cases of disputed lights, rights of way, &c. As a specimen of the engraver's art it stands without a rival. This may be accounted for by the engraving of the major part being the handiwork of Hollar. It is easy to trace where this great artist left off and where an inferior hand began.

Vertue, the engraver, stated that he had re-engraved in facsimile an ancient map of London in the possession of Sir Hans Sloane, to which he assigned the date of 1560, and further alleged that it was probably the work of Ralph Agas, who was a native of Stoke-by-Nayland, in the county of Suffolk. The date of his birth cannot now be exactly ascertained (the parish registers commencing only in 1558), but it may be conjectured that it probably occurred at some period between the years 1540 and 1545. Of his early life little is now to be discovered, but the following facts have been gleaned from the register of the parish as to his family. The first is dated "9th April, 1579; christened Thomas, son of Ralph Agas." The next is that of his son Benjamin, "31st March, 1588; christened Benjamin, son of Ralph Agas." Then follow his grandchildren, "1597, December 31; christened William, son of Robert Agas." "1599, September 23; christened Robert, the son of Robert Agas."

In the Lansdowne MSS. preserved at the British Museum are several original documents, written in a very neat hand by Agas himself. The first is a letter addressed by him to William Lord Burghley, lord high treasurer to Queen Elizabeth. It is dated 1592-93, and entitled "A Noate for the Perfection of Lande Measure, and exact plattinge of Cities, Castels, Honors, Lordshippes, Manors, and Landes of all sorts, by Rad Agas." It is a quaint description of the manner of surveying lands, &c. In it he speaks of the profitable staff and the theodolite, of some 20 inches in diameter, with a protractor of 1 foot at least.

The next document in point of date is addressed to the same nobleman; it is dated in pencil 1597. In this he speaks of his labours in the Fenlands, how he had plotted out the ground, gauged the quantity of the waters, the ebbs and flows and the daily abuses of the landholders; and, while thanking his lordship for the bounties already received, alludes to a considerable sum which was still owing to him for his services.

There is also a document in the form of an advertisement, printed on a half-sheet quarto, to be issued to his patrons; in this he describes himself as of Stoke next Nayland, in Suffolk, and asserts that he had practised in survey for more than forty years. He states that he has a perfect knowledge of customary tenures and titles of all kinds, that he was a good penman and well acquainted with old records, &c. In another MS. we find an opinion given by him to the commissioners appointed to inquire into the question of concealed lands belonging to the Crown; it is dated November 5, 1606.

On November 17 in this year we find him lodging in London, at the sign of the Helmet in Holborn, at the end of Fetter Lane; and if we desire to learn what manner of man he was, his qualities, abilities, pursuits, &c., he has left us ample means in a very quaint document, issued doubtless as an advertisement. From this it would appear that he entertained a very good opinion of himself; besides his knowledge of surveying he was able to read old records, and to restore any worn, "obliterated or dimmed," as well as to make calendars to them. He could find the weight and measure of any solid body. He was clever in arithmetic. He had a recipe for the preservation of the eye. He could remove and replant without injury trees of a ton weight, and had had forty years' experience in his profession. His decease is thus recorded in the parish registers of Stoke-by-Nayland already referred to:—"Burialls Anno Dñi 1621. November 27 was buried Ralfe Agas, an aged," that is, an aged man. The diary of Adam Winthrop, of Groton, Suffolk, appended to the "Life and Letters of John Winthrop, Governor of the Massachusetts Bay Company, at their emigration to New England in 1630, contains the following entry:—"1621, Nov. 26, Ralfe Aggas, the creple died." Supposing, therefore, that he had attained the age of eighty, his birth would have occurred in or about the year 1541.

The only copies of the works generally ascribed to him now extant are three, namely, one of the city of Oxford preserved in the Bodleian Library, and two of London, one of which is to be found in the Pepysian Collection at Magdalene College, Cambridge, and the other is the property of the Corporation of London. The only other survey of his of which particular mention is made is that of the town of Dunwich, in Suffolk, with its churches, adjacent villages, &c., on a large skin of vellum, with several remarks made by him in March 1589, which Vertue says he had seen. This plan, says Dodd in his "Connoisseur's Repertory," was formerly in the possession of Thomas Gardner, deputy-controller of the Customs, of Dunwich.

The dates to be assigned to the two published maps of Oxford and London have been the subject of much controversy among topographical authorities. The most important, indeed the mainspring of the whole, are the statements made by Vertue to the Society of Antiquaries. According to the minutes of March 21, 1736-37, "Mr. Vertue showed a plan and view of London and the river Thames, and parts adjacent, lately engraved by him, being the first large prospect made of the Famous Antient City. It was constantly reported to have been taken in Henry VIII.'s time, others said in that of Edward VI. But from several circumstances it appears to be early in Queen Elizabeth's reign. It was originally cut in several platts (*sic*), and published about anno 1560, the prints thereof being now of the greatest scarcity. Few copies are preserved, it being customary to hang them up against walls; therefore they decayed in length of time. Mr. Vertue gave the Society to understand that the plan then shown was reingraved, to oblige the curious and the antiquaries of this age, on eight plates of hard mettall, much in the same manner with that of wooden cutts, thereby to transmitt a just idea of the form and greatness of London as it was in Queen Elizabeth's reign."

The second minute is dated February 2, 1737-38, and runs thus:—"Mr. Vertue brought an account of the ancient print in the possession of Sir Hans Sloane, of the City of London, of which a copy has been taken and engraved by Mr. Vertue himself. It is intituled 'A Plan and View of London, with the River Thames and adjacent parts, being the most ancient Prospect thereof in Print.' This was reported to have been taken and done in Henry VIII.'s and King Edward VI.'s time. But from several circumstances it appears to be done early in the beginning of Queen Elizabeth's reign, about 1560, having been done in blocks of wood. The prints thereof are now of the greatest scarcity, being usually put up against walls in houses; therefore in length of time most of them decayed or lost. Above was CIVITAS LONDINVM. The original plan was probably the same which Radulphus Aggas tells us, in his plan of Oxford, that he had in his hand, and done after this was begun; but it must be observed that this very impression is a second publication, with the date 1618, and that there are several alterations from the first, in this particularly: instead of the arms as Queen Elizabeth bore them, those of King James I. and England, France and Scotland put in the place of them. And in the first has been explanations of the remarkable places in the City and suburbs, as may be observed in many parts by letters A, B, C, D, *a, b, c, d* of reference. The length of the printed plan, 6 feet 3 inches by 2 feet 4 inches, contained in six sheets and two half-sheets; but it seems the notes of explanation were at bottom printed on slips of paper to be added.

"Subjoined here are several remarks which show it was done in Queen Elizabeth's reign:—Westminster Palace water-gate, which belonged to the king, is there called the Queen's Bridge. At Charing Cross, Northumberland House, not built in the Strand, Arundell's Place. Paget Place, 1563, Sommerset Place. Lincoln's Inn Fields not divided. More-fields undivided. Royal Exchange—not built till 1570. Bulwar's water engine set up—1594-95. Nor is it in Norden, 1593. N.B.—To oblige the curious of this age, an. dom. 1737, it was re-engraved to hand further to posterity the ancient extent of this famous City of London from the old print of it in possession of Sir Hans Sloan, Bart., by G. V."

Gough, in his "British Topography," published in 1780, adopts the statements of Vertue, which he had evidently seen, but quotes the opinion of the antiquary Bagford that it was finished in 1588, and of Mr. Ward that it was not finished at that time. He gives the date to a copy of the map in the possession of Sir Hans Sloane, 1618: this is the first statement of a date, but he thought it was a republication with alterations. Thomas Dodd, in the "Connoisseur's Repertory," vol. i., says that Agas flourished in 1580, and that he surveyed London, but he affirms that his map was more in the nature of a bird's-eye view, and was prepared about 1578. He then goes on to charge Mr. Vertue with fabricating a copy of Agas's London, and complains of the faults committed in foisting this upon the public.

W. Y. Ottley refers to this Old Plan of London, and agrees with the date of 1560 for its preparation; he also confirms Dodd's account of Vertue's shortcomings. He quotes lines from Dodd's copy of the map to show that this edition was not published until James's reign.

The two copies referred to by Gough as being in the possession of Sir Hans Sloane and Dr. Mead, if they really were copies of the original map, are not now to be found. The copy said to be in the Lambeth library is Vertue's edition. The different editions contended for by Ottley have also disappeared. The only two copies of the original now known are the Pepysian and the Guildhall, and these are of the same date. Pepys's copy, preserved in his collection at Magdalene College, Cambridge, has written upon it in his own neat writing "A very ancient plan of London;" and in his index to the volume in

which it is bound he has written, "The most antient extant plan, very large, in wood," but he does not assign any date or author. The first person who asserts it to be Agas's production is Vertue. In his note book, preserved in the MSS. at the British Museum, under date 1736-38, appears the following not very intelligible extract—"Oxonia antiqua descriptio Radulphus Agas Año Dñi 1578—near tenn, begins to plotted out." This undoubtedly is the foundation of his subsequent statement before the Society of Antiquaries.

The theory of Mr. Overall was that if Vertue was correct in assigning its original production to 1560, it would appear impossible that Agas was its author, as he died in 1621; and supposing that Agas lived until eighty he would only have been nineteen in 1560. It seems incredible that at so early a period of his career Agas should have undertaken, much less completed, a work of such magnitude. From the lines upon Neale's reproduction of the map of Oxford, published in 1728, there can be no doubt that Agas had not begun London in 1588, when that map was finished, for in it he expressed his desire to portray the city as it then existed, and he gave his reasons why it should, in his opinion, be undertaken. It would seem too unreasonable to suppose that, if he had completed his survey prior to 1561, so remarkable an object as the steeple of St. Paul's, which was destroyed by lightning on June 4 in that year, could have been omitted. If Agas was the author the map could not have been prepared earlier than about 1591.

The size of the original map as given by Vertue is 6 feet 3 inches long by 2 feet 4 inches wide. This has been followed by Gough, Walpole and others. The two existing copies, however, are 6 feet and half an inch long by 2 feet 4½ inches wide. Of this map there have been various so-called *facsimile* reproductions from time to time. The earliest of these is that claimed by Vertue.

Important variations will be found upon a close examination of the two genuine maps, the two unsigned or Dutch copies, and those to which Vertue has appended his name.

First, then, as to the treatment of the waterbearers, a craft of considerable importance in London at this time; they are shown in Agas engaged in their occupation at the Tower Stairs and off the Steelyard in Thames Street, standing in the river filling casks (which are slung across the backs of horses pannier-wise) with a long-handled ladle or small bucket. Vertue, as an Englishman and an antiquary, would readily have understood this ancient custom, but it would be easy for a foreigner to have misunderstood this operation, and have supposed the horses to be cows driven into the river to drink; and it is a curious fact that the unsigned copies omit altogether these figures at the Tower Stairs, whilst at the Steelyard they actually appear as cows, and the man is on horseback, the long-handled ladle being turned into a whip, driving them into the river. Strangely enough, the copies bearing Vertue's name are identical in the treatment of these figures. In Agas is seen in mid-stream off Baynard's Castle the royal barge, on which the arms of Elizabeth are displayed, being rowed up towards Westminster. In the unsigned maps, and in Vertue's copies, this is altogether omitted. The architectural details of Baynard's Castle as shown in Agas are differently treated in the unsigned, whilst in Vertue's we can easily discern the additions made with a dry point, in order to make it more in accordance with Agas. The Blackfriars Stairs as given in Agas are omitted in the unsigned; in Vertue's copies we can easily detect their subsequent insertion. The same remarks will apply to the martello tower at the entrance to the river Fleet and Bridewell Palace. At the rear of Bridewell Palace grounds in Fleet Street, the church of St. Bride, which is faithfully portrayed in Agas, is represented identically in the unsigned and in Vertue's copies as a block of ordinary buildings. The round tower of the Temple Church is a prominent feature in Agas, and the name appears upon it. This historic building, strangely enough, is omitted altogether in the unsigned copies as well as in Vertue's.

On the opposite side of the river, at Paris Gardens, Agas shows buildings close up to the river bank, with stairs leading to the river, and the boats thereat; at the end of the broad road leading up to the buildings from Lambeth a cross is depicted in the centre of the roadway, and on the left of the road is an open ditch crossed by a footbridge. In the unsigned copies and in Vertue's, which are precisely similar in all the details, the stairs, boats, cross, ditch and footbridge are all omitted, and the style in comparison with Agas's is contemptible.

The people walking in the fields wear, in Agas's, the costume of Elizabeth's time, while in the unsigned and Vertue's some of the figures are altogether omitted, and those remaining are in the dress of the time of William III. The lower part of the map near this spot, which Agas depicts as fields, is occupied, both in the unsigned copies and in Vertue's, by printed references to the principal buildings. To the right of these references is shown a field, the boundaries of which in all the maps are the same, but the treatment of the details differs from Agas; in the unsigned and Vertue's copies these latter being

identical even to a line, and in the copies bearing Vertue's name the inscription "G. Vertue, Soc. Antiq. 1737," has been evidently added, like the other alterations, with a dry point, over the previously engraved lines.

Coming back again to the City, it is curious to note that the street leading from St. Paul's Churchyard is not shown, either in the unsigned or Vertue's copy, while in the original map it is most distinctly indicated. The treatment of the London Wall between Ludgate and the river Fleet is exactly similar even to a line in the unsigned and Vertue's, but is singularly at variance with Agas, in which the architectural features of the wall are well defined. Smithfield, again, is very differently treated in Agas from the unsigned, which exactly accords with Vertue.

One other important building calls for particular attention, the cathedral of St. Paul's. In Agas's map the church of St. Gregory and the chapter-house on the southern side are marked features. The unsigned copies indicate houses all along the south-west side, and the church of St. Gregory has no tower. Vertue's copies, however, show the marks of alteration distinctly at this spot. The nave of the cathedral and St. Gregory's church are made to resemble Agas.

After a careful study and comparison of the several maps, and the numerous alterations and inconsistencies, Mr. Overall was reluctantly compelled to confirm the strong statements of Dodd and Ottley, and to believe that Vertue knowingly committed a literary fraud upon his antiquarian friends, of which all antiquaries have since unhappily been the victims. He had doubtless become possessed, by purchase or otherwise, of the pewter plates prepared by some Dutch engraver (name unknown) in the reign of William III. (the conventional treatment, not only of the map, but the costume of the figures, appears very much to strengthen this idea), and then set about altering the plates where they were glaringly wrong, and would otherwise have been at once detected.

INTERRUPTION OF AIR CURRENTS.

ON Monday judgment was given in the Court of Appeal by Lords Justices Lindley, Kay and Lopes, in the important case *Chastey v. Ackland*. It was heard at the Exeter assizes, when judgment in favour of the plaintiff was given by Mr. Justice Cave. The defendant appealed. According to the *Times* report the back windows of the plaintiff's house in the city of Exeter look into a yard 28 feet wide. The house is in a row of houses which have similar courtyards behind them, the yards together forming a space of some length and of the width above mentioned. In these yards are low buildings, including a urinal, opposite to the plaintiff's house, belonging to a drill-hall, which is on the opposite side. The series of yards run north and south. On the same side as the plaintiff's house is the house of the defendant. It is the last house northwards in the row and is three houses distant. The defendant had a low building which closed his yard at the northern end. He has raised this building 16 feet. Also the defendant has built another lower building within his courtyard and opposite to a passage 4 feet wide between another low building and the eastern wall of the drill-hall. The plaintiff complained of these erections on the ground that they diminished the light and air coming laterally to his back windows. The case was tried by agreement by a judge without a jury, and, by consent of all parties, the judge personally inspected the premises. He found that there was some obstruction to light by the building which had been raised 16 feet, and he estimated the damage thus occasioned to the plaintiff at 10%. But he found that the interruption to the air was serious and occasioned a nuisance, and, putting the two things together, on the ground of this interference with the light and the air, he granted a mandatory injunction, in effect ordering the defendant to take down the buildings which he had recently erected, and to restore the condition of the premises to what it had been before that erection. The plaintiff's windows are more than twenty years old. There was a conflict in the sworn evidence as to the effect of the buildings upon the plaintiff's house. The learned judge apparently agreed with those witnesses who said that the air in the plaintiff's yard had become more stagnant, and that the basement of his house had become damp and the air in the rooms stuffy and unwholesome.

Lord Justice Lopes read a judgment, in which he said:—The evidence leads me to the conclusion that there is a want of ventilation and an absence of the means of carrying off bad smells on the plaintiff's premises, and that probably the interruption to the free passage of air over the plaintiff's premises caused by the defendant's new wall has aggravated the mischief which had previously existed. But nothing deleterious, nothing hurtful, nothing disagreeable is brought on the plaintiff's premises by anything which the defendant has done. The bad smell and the stuffiness which interfere with his comfort arise on the plaintiff's premises. Unless the plain-

tiff has against the defendant a right to get rid of this in the particular way which has been interfered with by the defendant he cannot sue the defendant for a nuisance because the smell and stuffiness, arising on his own premises, for which he has not provided any effectual means of escape cause him annoyance. Every man has a natural right to enjoy the air pure and free from noxious smells or vapours, and any one who sends on his neighbour's land that which makes the air impure is guilty of a nuisance, but a man must not impose an obligation on his neighbour by having a want of proper ventilation on his own premises. If any nuisance existed it was not a nuisance created by the defendant, and I am unable to agree with the learned judge in the court below in thinking that the plaintiff has any cause of action against the defendant on the ground of nuisance. The case of *Bryant v. Lefevre* (4 C.P.D. 172) is directly in point, and the reasoning in that case applies here. But it is contended on behalf of the plaintiff that independently of nuisance he has a right to the free passage of air over and above his premises—a right to have any disagreeable smell existing on his premises carried away by the current of air which would pass over his premises—which right the defendant, by his new buildings, has infringed. It becomes necessary to consider what legal right with regard to the free passage of air the plaintiff has against the defendant; what unlawful act the defendant has done which entitles the plaintiff to complain. By raising his buildings on his own land (which he had a perfect right to do) he has to some extent intercepted the free passage of air above and around the premises of the plaintiff. The current of air comes from the defendant's premises laterally to the plaintiff's premises, but through no defined aperture or passage. The air is at large and in no way confined within finite limits. The claim of the plaintiff is not to have the air pass through some definite channel constructed for the purpose of containing and communicating it, but it is to have the current of air float over the whole of the plaintiff's property—over the yard and the rest of his property at the back of the house. Such a right cannot be maintained. The plaintiff cannot, in support of the alleged right, rely on prescription at common law, because the houses have been built within legal memory, nor on prescription by statute, because the right to the passage of air is not a right to an easement within the meaning of 2 & 3 Wm. IV. cap. 71, sec. 2, nor on the presumption of a lost grant from long continued enjoyment, because such a presumption only arises where the person against whom the grant is claimed might have prevented or interrupted the exercise of the subject of the supposed grant. Such prevention or interruption is practically impossible here. Lord Justice Bowen in *Harris v. De Pinna* (33 Ch. D. 262) says:—"Then we come to air. It seems to me that the only claim for air which could be supported here is a claim to the passage of undefined air over the premises of the defendant until it reaches the plaintiff's property. It would be just like amenity of prospect, a subject-matter which is incapable of definition. So the passage of undefined air gives rise to no rights and can give rise to no rights for the best of all reasons, the reason of common sense, because you cannot acquire any rights against others by a user which they cannot interrupt." But it was urged that the right to the access of air had been acquired by an implied covenant, an implied covenant entered into at the time the houses were built, that the owners of the adjoining houses would not do anything to intercept the free passage of air over his neighbour's property. The answer is that there is nothing from which such a covenant can be implied. *Hall v. Lichfield Brewery Company* (49 L.J. Ch. 655) was a case where the plaintiff had for upwards of thirty years enjoyed a free access of air to his slaughterhouse through two defined apertures, and there were circumstances in the case raising the presumption of an implied covenant. It was a user, too, which might have been interrupted. The law will not imply a grant except it is of something definite. The undefined passage of air is too vague. If the plaintiff has been inconvenienced by anything the defendant has done, it is *damnum absque injuria*, and affords no legal ground of complaint to the plaintiff. The appeal must be allowed.

Lord Justice Kay (after stating the facts as above) continued:—Lord Cranworth, in *Durell v. Pritchard* (L.R. 1 Ch. 250), said that the court will not interfere by way of mandatory injunction, except in cases in which extreme, or, at all events, very serious, damage will ensue from its interference being withheld. Applying this rule here, the learned judge seems to have thought that the damage done by interference with light would not alone have justified the granting of a mandatory injunction. The question is, whether the interruption of the current of air past the back windows of the plaintiff's house, in addition to the interference with the light, warranted the court in granting it. It is denied in argument that such an interruption of air constitutes a legal wrong. It is pointed out that there is no diminution of the quantity of air that would enter any window of the plaintiff's house. The defendant has not built anything opposite to any of those windows.

All he has done is to prevent some of the current of air, which, before his buildings were erected, would pass through the series of back yards, including the plaintiff's yard, from passing the plaintiff's windows, and thus the air which enters the plaintiff's house by those windows is rendered less fresh and salubrious. The case is different from the act of a man who fouls the air on his own land, as by brickmaking, and allows that foul air to pass on to his neighbour's land. The defendant here has not fouled the air. By diminishing the current over the plaintiff's yard he has rendered the air in that yard more stagnant, so that, if any foul exhalation mingles with it, that exhalation does not pass away so speedily as it would before. In *Webb v. Bird* (10 C.B. N.S. 268) and in the Exchequer Chamber (13 C.B. N.S. 841) very eminent judges agreed in deciding that building upon a man's own land so as to diminish or interfere with the air which came to the plaintiff's windmill was not a legal wrong, although the windmill had existed more than twenty years. They held that the right to the passage of the air was not an easement within 2 & 3 Wm. IV. cap. 71, sec. 2, and that no presumption of a grant of such a right could be made, because it would have been difficult, if not impossible, for the owner of the adjoining land to interrupt it so as to prevent the acquisition of it by lapse of time. Lord Blackburn, in his judgment, guards himself against saying anything which would affect the common law right which may be acquired to the access of light and air through a window. His lordship referred also to *Bryant v. Lefevre* (4 C.P.D. 172) and *Harris v. De Pinna* (33 Ch. D. 238). On the other hand, there is authority for the proposition that the diminution of the quantity of air entering a house by a defined aperture which has existed for the admission of air for more than twenty years may be a legal wrong. In *Aldred's case* (9 Co. 58b) Chief Justice Wray said that "for stopping as well of the wholesome air as of light an action lies, and damages shall be recovered for both of them, for both are necessary, for it is said, *et vescitur aura aetherea* . . . but for prospect, which is a matter only of delight, and not of necessity, no action lies for stopping thereof . . . and if the stopping of the wholesome air gives cause of action, *a fortiori* an action lies . . . for infecting and corrupting the air." His lordship also referred to *Gale v. Abbot* (8 Jur. 987), *City of London Brewery Company v. Tennant* (L. R. 9 Ch. 221), *Hall v. The Lichfield Brewery Company* (49 L.J. Ch. 655), and *Bass v. Gregory* (25 Q.B.D. 481), and continued:—Now, the question is within which of these two classes the present case comes. It was put in argument as an interference with the air coming to the plaintiff's windows. I have pointed out that the acts of the defendant have not diminished the quantity of air entering those windows, nor have they altered the quality of the air which passes from the defendant's land. The consequence of the air in the plaintiff's back yard becoming more stagnant seems to me to be too remote to make what the defendant has done a legal wrong. But the learned judge seems to have found that the defendant's acts have occasioned a nuisance to the plaintiff. So far as that nuisance results from emanations from the urinals and other conveniences in any of the back yards, the reasoning of the judges in *Bryant v. Lefevre* seems to apply. These are not caused by the defendant, and the remedy, if any, should be sought against the owners of the several erections which emit noxious odours. But can an interference with light or air which is not otherwise actionable be restrained on the ground of nuisance? Lord Justice Bramwell, as I have pointed out, says it cannot. Suppose a man were to build a house on the edge of his own land, with windows for the admission of light and air looking over his neighbour's land. Nothing could be a greater nuisance than completely to block such windows by building a wall immediately opposite to them. But it cannot be doubted that the neighbour might do this at any time within twenty years. It is quite right to say, as Lord Selborne intimated in the words I have quoted, that a diminution of the quantity of air coming to a defined aperture in a house which has existed for twenty years so considerable as to cause a nuisance may be actionable. But that is the only way in which the term can properly be applied to a mere diminution in the quantity of the air. Unless the right to have it come over the land of another has been acquired by lapse of time, the mere diminution of quantity is not a nuisance in law. The result is that the interference with the current of air in this case was not such as to cause an actionable wrong, and the injunction must be dissolved. The judgment should be for 10% damages and costs of the action, save so far as increased by the claim as to air, and the defendant must have the costs of the appeal.

Lord Justice Lindley said:—I concur in the judgments which have been read, but I will add a few words to explain the view which I take of the case, which I regard as an extremely important one. It has been decided that the right to air is not an easement within section 2 of the Prescription Act (*Webb v. Bird*, 13 C.B. N.S. 841). Independently of the Act, everyone has a right to enjoy whatever air comes to him, but

speaking generally and apart from long enjoyment, or some grant or agreement, no one has a right to prevent his neighbour from building on his own land, although the consequence may be to diminish or alter the flow of air over it on to land adjoining. So to diminish a flow of air is not actionable as a nuisance. But, although the Prescription Act does not apply to air, a right to have it come over another's land, in some definite direction to some particular place, can, I apprehend, be established by what is called immemorial user, or by user which may have had for its origin some lost grant or agreement binding on the owners of the servient tenement. In the present case immemorial enjoyment is not alleged, no doubt because the plaintiff's house is not sufficiently old. Then, as to a lost grant or binding agreement to allow air to come freely to the back of the plaintiff's house over the defendant's land, the plaintiff does not prove enjoyment of air coming in any definite direction over the servient tenement, and to burden the servient tenement to the extent necessary to protect the plaintiff from the diminishing of the free passage of air to the yard at the back of his house is, I think, contrary to the authorities, and would be to stretch the doctrine of lost grant further than principle warrants. The subject-matter of the grant is too indefinite. The doctrine, if applicable to one neighbour, would be equally applicable to all, for better and for worse; and there are no grounds for benefiting or burdening all or any of them to the extent necessary to protect the plaintiff in the enjoyment of the right which he claims. The plaintiff did not prove the existence of any covenant or agreement binding the defendant not to build over his own back yard so as to interfere with the comfort of the plaintiff, and there are no materials for holding that any covenant to that effect was ever in fact entered into. But in the absence of such a covenant, express or implied, the plaintiff's claim to relief in respect of air cannot, in my opinion, be supported. The appeal must, therefore, be allowed; the judgment must be reversed, and the plaintiff must have judgment for 10*l* for the injury done to his ancient light and for the costs of the action, except so far as they have been increased by the claim to air, which he must pay. He must also pay the costs of the appeal, and the costs must be set off against each other in the usual way.

THE ROYAL SCOTTISH ACADEMY'S SUPPLEMENTARY CHARTER.

AS already stated, says the *Scotsman*, the Queen in Council has been pleased to pass the supplementary charter of the Royal Scottish Academy. The charter provides (1) for an honorary retired class of Academicians. It is provided that Academicians who through advanced age, infirmity or otherwise, are unable to fulfil the active duties of an Academician, and who desire to be admitted into this class, shall signify their wish by letter to the secretary, and if the application is acceded to at the next ensuing Assembly of Academicians, a vacancy in the list shall be declared and filled up by a new election. The honorary retired Academicians are to be exempted from serving on the Council, on the committee of arrangements for the annual exhibition and as visitors in the schools. They retain their right of attending and speaking, but not of voting, at all general assemblies of the Academy and assemblies of Academicians, and they are to be eligible for election to any other office for which Academicians are eligible. They are to bear the title of Honorary Retired Academicians, retain the right to append the letters R.S.A. to their names, the right to their pensions and the right of exhibiting one work annually, but the number may be increased by special permission of the Council. It is also enacted that Academicians who by a resolution of the Assembly of Academicians, passed by a two-thirds majority after notice, shall be found to have for five consecutive years after the date of the supplementary charter failed to fulfil the active duties of an Academician, may be placed on the honorary retired list of Academicians, and Academicians so placed on the retired list before attaining the age of sixty, for reasons other than ill health or accident, shall have no right to participate in the pension fund of the Academy. (2) Provisions under this head refer to the formation of a honorary retired associate list, and are in the main, with necessary modifications, applicable to associate rank, the same as those just quoted. (3) The Academicians in assembly are to have power to determine from which branches of art represented in the Academy—painting, sculpture, architecture, or engraving—and in what numbers or proportions from each branch, new Academicians or associates about to be elected by a general assembly shall be selected or chosen. The fourth division of the charter refers to the mode in which artists may be nominated and elected to associate rank, and is rather a matter of internal administration than of general interest. The fifth provision deals with the procedure to be followed by an associate after election in taking up this rank; and the sixth declares that no resolution of a general assembly or of an assembly of Academicians on matters other than the election

of members and office-bearers and ordinary routine business shall be valid until it is confirmed by the next general assembly of the Academy or assembly of Academicians as the case may be. The seventh clause was to this effect:—"Without prejudice to the provisions of the said supplementary charter relating to making, altering and annulling rules, we hereby give to the members of the Academy at their assemblies of Academicians power to make rules providing that any member of the Academy who, after the date of this supplementary charter, shall become a member of or exhibit with any other society of artists established in Edinburgh shall forfeit his membership of the Academy, and all the rights and privileges pertaining thereto, provided always that such rules shall not apply to members of the Academy elected prior to the date of this supplementary charter, who may after its date exhibit with any society of which they were members prior to the date of this supplementary charter."

Against this seventh clause objections were lodged by the Society of Scottish Artists on the ground that "the clause is retrograde in character and detrimental to the interests of art in Scotland; that in London members of the Royal Academy are not debarred from being members of, or exhibiting with other societies in London, such as the Grafton and New Galleries, of which the members and associates of the Royal Academy are amongst the most prominent supporters, and the Royal Society of Painters in Water-Colours, whose president is Sir John Gilbert, R.A.; that this power, if granted to the Royal Scottish Academy, would, on the other hand, obviously debar the possibility of there being similar exhibitions in Edinburgh, and thereby vitally affect the existence of the Society of Scottish Artists, which has already done so much to promote the interests of the public in art and to encourage the younger artists."

In answers by the Academy to these objections, it is pointed out that the Royal Scottish Academy provides the only public art school in Scotland. It had long conducted with conspicuous success a life school in which art students have been gratuitously instructed in the principles and practice of the art of painting under the immediate supervision of the members of the Academy, and that in this life school a large number of Scottish artists, including most of the members of the objecting society and all the artist signatories of the objections have received training at the expense of the Academy. The Academy also maintains an art library, to which artists, students and others have access free of charge. While thus performing public functions of the highest importance for the advancement of the fine arts in Scotland, the Academy receives no aid or subsidy from the State. The Academy has no funds available for these purposes except the income derived from the annual exhibition held in Edinburgh; and in order to maintain the attractiveness of the exhibition and to insure the continuance of the revenue derived from it and devoted to the public purposes already mentioned, it is necessary that the members of the Academy should loyally support the exhibition; and the object of the proposed clause is to remove any doubts as to the Academy's right to enact laws, if necessary, to secure that loyalty, which will, it is hoped, be freely rendered apart from any regulations. It is further pointed out that this clause was in the original charter, and although it was dropped out of the 1891 supplementary charter, it was never intended that the Academy should give up all control over its own members. "Membership of the Academy," the answers go on to say, "involves duties and responsibilities, the observance and recognition of which the Academy ought to have power to enforce should occasion demand it, and it is confidently affirmed that the members of the Academy will not claim the right to promote the success of other societies by sending their work to other exhibitions instead of to the Academy exhibitions to the detriment of the Academy, while retaining all the advantages derived from membership of the Academy. If the members of the Academy do not claim such right, it may with confidence be submitted that no other persons are entitled to claim it for them." Figures are given to show that the Royal Scottish Academy has always treated artists outside the Academy with generosity at the exhibitions. In 1894, it says, seventy members of the Academy exhibited 192 works, while the other 218 exhibitors who were not members exhibited 337 works. The answers point out that the objectors are wrong as to the Royal Academy, and that a clause similar to the seventh clause of the supplementary charter is part of the constitution of that body. It might be that the Academy did not stringently enforce the rule, but the rule forms part of its constitution. What, it says, is asked by the Royal Scottish Academy is not that the provision should be made absolute by being incorporated as a positive enactment in the charter, but that the Academy should have power to make a rule similar to the existing rule of the Royal Academy of Arts. It is also pointed out that any analogy between London and Edinburgh is necessarily fallacious and misleading. In London, with its population of nearly five millions, consisting to a considerable extent of travellers from all parts of the globe, there is almost

unlimited scope for exhibitions of art, and of each receiving substantial public support. In Edinburgh, on the other hand, with its population of 260,000, there is no room for the multiplication of exhibitions, and the only effect of multiplying them must be to so dissipate and distribute the support of the art-loving public as to lead to the discontinuance of some, if not all.

On February 21 last the clerk to the Privy Council wrote asking if the Academy would be willing to accept a supplementary charter excluding the seventh clause. To this letter Messrs. Skene, Edwards & Garson, the law agents of the Academy, acting under instructions from an assembly of the Academicians, replied on March 14 that the other provisions of the draft supplementary charter are, in the view of the Academicians, so important that it will be their duty to accept them even if the seventh clause should be excluded. The Lords of the Council are again asked to consider the views of the Academy on the point, and in the letter the answers just referred to are again shortly gone over, it being pressed that the only source of income of the Academy whereby it can discharge its duty to the life school and other art objects is derived from the exhibition, and that it is desirable that the Academy should be enabled to maintain the attractiveness of the exhibition. Unless it is able to do so, it may find itself unable to continue the performance of the teaching functions which had hitherto formed so valuable a feature of its work. The great majority of the members are loyal to the Academy, and all that is asked under the seventh clause is a declaration that the Academy has a claim on the loyalty of all its members. The application for the clause was not made lightly or hastily. The experience of recent years has shown that something of the kind is necessary to maintain the resources of the Academy so as to secure the continued efficiency of the life school, which otherwise may have to be abandoned. Having made the application, and having discharged themselves of responsibility, the petitioners say they must accept the decision of their lordships, whatever it may be.

In the decision of the Privy Council the seventh clause is struck out of the charter, which otherwise has been passed.

THE CONVENT OF MONTE OLIVETO.

A CORRESPONDENT of the *Manchester Guardian* having visited the Benedictine Monastery of Monte Oliveto Maggiore, which is now in the possession of the Italian Government, gives the following account of the works of art to be seen there:—

The chief artistic attractions of Monte Oliveto are naturally the frescoes by Luca Signorelli and Sodoma, dealing with the legends of the life of St. Benedict, which cover the four walls of the great court, and it was to these that I first directed my steps. Whatever opinion we may form in general as to the respective merits of Signorelli and Sodoma (if, indeed, it be worth while to compare two artists so fundamentally different), there can be no question that the frescoes by Sodoma here at Monte Oliveto, as they are more numerous and in better preservation, are also on the whole far more interesting than those of the slightly older master. They both took the story of the life of St. Benedict as it is related in the dialogues of St. Gregory the Great—Signorelli dealing with the saint's life at Monte Cassino, and Sodoma, who succeeded him, with the earlier and later incidents of that life, but, apparently from want of space, the story is not completed. Sodoma's work is particularly interesting because it displays not only that refined, almost morbid feeling for beauty in face and figure which is the main characteristic of the Lombard master, and which the student can observe to perfection in the churches of Siena; but also some qualities which are perhaps hardly so noticeable elsewhere—a power of imparting expression to his faces, considerable humour in the by-play of the scenes, and occasionally a certain amount of dramatic effectiveness. Vasari asserts that the monks dubbed him "Il Mattaccio" on account of the mad pranks he played (though this may refer either to the work of his brush or to his general life at the convent), and he certainly appears to have worked more at his ease than was usual with him, with a greater sense of liberty in the treatment of his subjects, and with the determination of finding as much entertainment as possible in his work. No single fresco by him is more interesting perhaps than the one in which he has painted himself in a splendid dress, with his wife and little daughter prominently among the crowd who are gazing up at the architrave of the church, where is suspended the wooden dish which Benedict's nurse has broken by mischance, and which has been restored by the prayers of the youthful saint. The yellow embroidered cloak, the cap and sword, in which Sodoma has here depicted himself, had belonged, it appears, to a Milanese gentleman who had come to Monte Oliveto to take the monkish habit; and the general of the order sold them to Sodoma. Vasari, whose life of the painter contains several proved inaccuracies, and is, moreover, marked throughout by

obvious personal animosity, states that the dress was given to Sodoma; but that he purchased it for a fixed sum is proved by a document in the archives of the monastery, now at Siena. In other frescoes, again, he has introduced the portrait of the then general of the order, who had offended him by refusing the increased emolument he had asked for, and those of his fellow-artists, Fra Giovanni da Verona and Fra Raffaello da Brescia, and his interest in animal life is shown by the beasts and birds he continually introduces. Altogether we may say that these frescoes show the Lombard as an admirably endowed artist, who through carelessness or impatience of study did not perhaps always do full justice to himself, but who merits far higher praise than that which Vasari so grudgingly doles out to him. These frescoes are not all the work which Sodoma executed for the monastery. On a dark landing, and much faded, is a coronation of the Virgin in fresco by his hand, where the face of the Saviour, the best preserved portion of the work, is of the most exquisite and touching beauty. And in the *sala* of the apartment I occupy is a St. Peter by him in fresco over the door, and, high up on one of the walls a woman's face of much beauty, probably a fragment of an Annunciation. The monastery contains many artistic treasures besides those mentioned. That admirable worker in intarsia, Fra Giovanni da Verona, and his disciple in wood-carving, Fra Raffaello da Brescia, both Olivetan monks, seem to have frequently visited the monastery and done much work here. Fra Giovanni not only executed in intarsia the panels of the choir stalls in the church, of the great lectern (the carved portion of which bears the name of his pupil and fellow-craftsman), and of a cabinet in the library, but he also designed (so the abbot assured me) the capitals of many of the pillars in the courts, wrought in grey stone, not unlike the *pietra serena* of Fiesole, but less durable, and still found in the volcanic tufa of the neighbourhood. In a niche in the passage leading to the church and immediately above a square marble slab let into the pavement, bearing the words (how eloquent in their simplicity!) "*Monachorum Sepulchra*," is a beautiful marble statuette of the Virgin and Child, with the date 1490, which has been attributed it seems to Benedetto da Majano, but which the abbot believes to be likewise by Fra Giovanni da Verona. There are many frescoes or fragments of fresco in different rooms of the monastery, some by inferior artists, but others of great beauty, and fresh ones are frequently being discovered under the whitewash with which they have been barbarously concealed. One of the most beautiful is a round fresco in the linen-room, a Madonna and Child, with an Olivetan monk imploring their protection, a work of extreme loveliness, which has been attributed—it would appear, without much reason—both to Benozzo Gozzoli and to Matteo da Siena. Nothing can well be more charming than the rapt devotion in the monk's face, the smiling assurance of the Madonna, and the gracious attitude of the Child. To the hand of Pinturicchio is attributed a fresco in the choir niche of the chapel of S. Scolastica, which has been much retouched, but where the angels, playing different musical instruments on each side of the glorified Madonna, are certainly quite in the manner of that master. Altogether it may be said that Monte Oliveto provides the art student with abundant material for study and with several problems which still await their solution.

THE HELLENIC SOCIETY.

ON Monday was held the annual meeting of the Hellenic Society. The council in their report, after congratulating the society upon a session of steady progress and good work, expressed regret at the heavy losses sustained during the last year by death. The obituary record included Sir Charles Newton, Professor Gustav Hirschfeld, of Königsberg, who was in charge of the excavations at Olympia when the *Hermes* of Praxiteles was discovered, Sir Henry Layard, Sir James Lacaita, Professor Stuart Poole, Professor A. C. Merriam (of Columbia College, one of the most accomplished of American archaeologists), Professor H. C. Goodhart (of Edinburgh), and Dr. Greenwood (formerly Principal of the Owens College, Manchester). Professor Heinrich von Brunn and Mr. George Dennis had ceased to be honorary members, and their places had been taken by Professor Furtwängler and Professor Petersen. As in former years, the council had been called upon to support various projects of excavation and exploration. The most important was a scheme for excavations in Alexandria, conducted under the direction of Mr. D. G. Hogarth, and in concert with the authorities of the Egypt Exploration Fund. After careful consideration the council voted the sum of 100% towards the experimental excavations which, it was thought, would serve to show whether any substantial results were to be expected. After some months' trial Mr. Hogarth came to the conclusion that for all practical purposes ancient Alexandria did not exist. As soon, therefore, as he had proved the ruinous state of the scanty remains Mr. Hogarth held his hand, and about a quarter of the grant would be returned. Smaller grants of 25% each were

voted to Mr. J. A. R. Munro for exploration in Asia Minor, and to Mr. J. L. Myres for exploration in the island of Amorgos, though in the event the latter was not applied for. The usual grant of 100*l.* had been made to the British School at Athens, two of the students of which institution—Mr. E. F. Benson and Mr. Bevan—worked under Mr. Hogarth at Alexandria. A determined effort was now being made to place the school upon a sounder financial basis. The council sincerely hoped that the effort might be successful, feeling convinced that the maintenance of the school was of vital consequence to the promotion of Hellenic studies in this country. Within the last few months a scheme had been laid before the council for publishing from time to time illustrated catalogues of the numerous private collections of Greek antiquities which existed in this country, and arrangements had been made for carrying the scheme into effect as opportunity might offer. It was thought that such catalogues would be of immense value to students and of general interest to many members of the society. Probably a first instalment of these catalogues would appear in the course of the coming year. The treasurer's accounts showed ordinary receipts during the year of 910*l.*, against 1,034*l.* during the financial year 1893-94. The receipts from subscriptions, including arrears, amount to 692*l.*, against 715*l.*. The receipts from life compositions amounted to 50*l.*, against 79*l.*—a falling off of 29*l.*; and receipts from libraries and for the purchase of back volumes to 122*l.*, against 229*l.*—a decrease of 107*l.*. Receipts from other sources of ordinary income showed no material alteration. Since the entrance fee was imposed, in January 1894, about 50*l.* had been received from this source, a very substantial addition to the society's income. In the matter of ordinary expenditure, amounting to 730*l.*, against 894*l.* in the previous year, there was an increase of 7*l.* in respect of rent, while the stationery, printing and postage remained as last year—at 49*l.*. The expenditure on the library had been 96*l.*, against 75*l.* in the preceding year. The cost of the Journal, vol. xiv., parts 1 and 2, had amounted to 441*l.*. Besides the annual grant of 100*l.* to the British School at Athens, 125*l.* had been granted for other purposes, and a balance was carried forward at the end of the financial year of 169*l.* 7*s.* 6*d.*, against 214*l.* 10*s.* 7*d.* at the close of the preceding year. Forty-one new members had been elected during the year, while twenty-six had been lost by death or resignation. This showed a net increase of fifteen, and brought the total number of members up to 784. In conclusion, the council felt that the society was in a thoroughly healthy condition. The number of new members was fairly satisfactory. The work done or in contemplation was such as fully to maintain the society's reputation for enlightened zeal in the cause of Hellenic studies. The report was adopted.

THE PROPOSED WORKS AT PHILÆ.

IN his report to the Government on the progress of reorganization in Egypt, Mr. Villiers Stuart, the Egyptologist, writes:—As connected with the subject of irrigation and the question of the projected reservoirs at Philæ, I visited this island in order to judge for myself of the effect of restoring the walls with which it was once surrounded and raising them to a sufficient height to keep out the water in case the scheme of a great reservoir at this point was carried out. I traced the foundations of the original wall in its entire circuit; it was about 700 yards in circumference. At one point there is a natural wall already, of more than sufficient height, consisting of immense granite boulders; this formation might be imitated at intervals in the new wall so as to break its formal appearance and give it a certain correspondence with Biggeh and the other islands around. Within the enclosure there would be a distance of about 60 yards between the west wall and the temple, but considerable less on the east. The chief temple faces south, and the space intervening between the façade of the great pylon and the southern extremity of the island, more than 100 yards in length, is disfigured with mounds of mud bricks, the relics of Arab and Coptic houses. This could be levelled and planted with palm groves, or converted into a botanic garden; this would form a picturesque and artistic setting both for the colonnades right and left and for the main temple itself. Thus within the enclosure, so far from the monuments being spoilt, they would, on the contrary, be set off to advantage, and rescued from their present squalid surroundings—an important improvement.

Externally the island would lose some of its picturesqueness, but not to the extent that might be supposed, for the palm groves and the higher portions of the temple would show above the enclosing wall, and Philæ would be more assimilated to the neighbouring islands. There would be nothing inconsistent with ancient traditions in the wall itself; all Egyptian temples were surrounded with high walls and embankments, and Philæ was no exception; it would be simply a restoration, but an improved one. The opposition to the scheme on the part of artists and archaeologists is based on misconception; most of

the opponents would be converted if brought to the spot and the effect explained.

The most important eclipse of the picturesqueness of Philæ would be while the reservoirs were full, but at that season it is not visited either by artists or archaeologists, and as the level sank Philæ would emerge uninjured in every respect.

Whether Assouan be the best point for the reservoir is an engineer's business to decide, but if it be, I have no hesitation in saying that the question of the Philæ monuments ought not to and need not interfere. The monuments would benefit rather than otherwise. I say this as an Egyptologist as jealous as any of my compeers for the conservation of every relic of the past. I met a well-known brother Egyptologist shortly afterwards who entirely agreed with me in my view.

NORTHERN ARCHITECTURAL ASSOCIATION.

AN outdoor meeting of the members of the Northern Architectural Association was held on Saturday last for the purpose of visiting the new tennis court erected by Captain Sir Andrew Noble within the grounds of Jesmond Dene House, from the designs of Mr. F. W. Rich, architect, who conducted the party over the building, and explained the nature of the game and its requirements. He mentioned that tennis courts of this description were not at all common, only thirty-three being known to exist in the United Kingdom. Among the oldest of these is that at Hampton Court, another being at Lord Salisbury's seat at Hatfield. Sir Andrew Noble's tennis court has been built by Messrs. Lesslie & Co., of London, who have also constructed other modern courts. Sussex bricks have been used throughout the building, which covers an area of about 800 square yards, including the bath and dressing rooms and marker's residence. Subsequently the party proceeded to inspect the reception-room at Jesmond Dene House. This mansion, the nucleus of which was originally built in 1822, has, during the last quarter of a century, been amplified by Sir Andrew Noble—Mr. R. Norman Shaw, R.A., and Mr. F. W. Rich acting as his architects. It now forms an imposing and picturesque feature in the finest part of Jesmond Dene. A vote of thanks to Sir Andrew Noble, and another to Mr. Rich for conducting the party, concluded the proceedings.

GENERAL.

The Harborne Charity Trustees have appointed Mr. Ralph Heaton (architect and surveyor, of Grosvenor Chambers, Birmingham) surveyor to their estates.

Mr. Arthur Oddy, of West Hartlepool, has out of over sixty applicants been appointed surveyor by the Pontefract Town Council.

The Chamber of Deputies in Lisbon was on Monday destroyed by a fire caused by the neglect of a plumber who was engaged in soldering the roof. The building was without architectural interest.

The Parish Church of Crathie, near Balmoral, was opened on Tuesday. It was designed by Mr. A. M. Mackenzie, A.R.S.A., and has cost about 6,000*l.*

Mrs. Gilbert, the widow of the late Josiah Gilbert, the author of books on Italian art, has presented to the University of Oxford two studies which are believed to have been prepared by Titian for his *Battle of Cadore*, a picture which no longer exists.

The Fishmongers' Company have contributed 1,500*l.* to the fund for the decoration of St. Paul's Cathedral, that sum being the cost of the mosaic in the chancel dome representing the Creation of Fishes.

Mr. G. E. Bissell, an American sculptor, has obtained a commission for the fourth panel of the pedestal of the Burns statue in Ayr. The subject selected is the parting of the poet and Mary Campbell.

Mr. Val Prinsep, R.A., will to-morrow open the sixth annual loan collection of pictures obtained for the benefit of the people of Southwark and the Borough, and which will be seen at the local Polytechnic in Borough Road.

The Hon. Philip Stanhope, M.P., has been appointed a trustee of the National Portrait Gallery.

The Albany Capitol, on which more than 21,000,000 dols. have been expended, has been entrusted to another commission, who will endeavour to complete the building. The estimated outlay is 3,000,000 dols.

Wilhelm v. Lindenschmidt, the historical painter, and one of the leading artists of the Munich School, has died in that city after a surgical operation, in his sixty-sixth year.

The Basement of the Ashmolean Museum, Oxford, has been assigned to the curators of the Bodleian Library.

A Steel Tower is proposed for erection as part of the Buda Pesth Exhibition in 1896. It will be 500 mètres high; the Eiffel Tower is 300 mètres. M. Husz has prepared the plans.

The Architect.

THE WEEK.

THE students of the Royal Academy have reason to lament the loss of JOHN EVAN HODGSON, who died suddenly on the 19th inst. As professor of painting and librarian he was ready to go far beyond the limits of official duties as they were defined by his predecessors in order to help any one who sought his aid. Among all the Academicians there was not one who was so competent to take charge of their valuable collection of books. He took delight in them, and, like PROSPERO, he considered he possessed a dukedom while he was among them. But it must be said his librarianship was not advantageous to him as a painter. He was always disposed towards the scholar's melancholy, and the sight of engravings and photographs and the other records of the great artists made him feel every day less and less confident in his powers to measure himself with Italians, Flemings and Dutchmen. His natural fastidiousness was increased by the studies for his lectures as professor, for he felt he ought to exemplify the advice he gave students by the excellence of his own pictures. Mr. HODGSON therefore suffered to an extent which the easy-going holders of the professorship could not understand. He was not a strong man in physique, and he laboured under the disadvantage, which arose from the honesty of his nature, of being unable to hold on by one class of subject persistently, as if it alone were worth painting. There was more versatility exhibited by him than by the majority of his contemporaries. Historical, domestic, Eastern and imaginative figure pieces were produced by him as well as landscapes. The consequence was that frequenters of the Academy would not be at the trouble to discover whether he possessed a style of his own. English amateurs believe in specialists, for their works are easily recognised, and the critical remarks of one season will serve for many. There was too much unworldliness about Mr. HODGSON to enable him to realise that condition of success. He laboured, too, under another disadvantage. He belonged to a family of northern journalists, and he possessed literary skill of an exquisite kind. We have no hesitation in saying there are unsigned articles by him in *The Architect* which neither Mr. RUSKIN nor any writer on art in this generation has surpassed. His signed articles and published lectures hardly do justice to his genius, for his instinct was journalistic and retiring. When he stood forth as J. EVAN HODGSON, R.A., he appeared out of his natural element, and curbed his power. It was when he could be emotional without any apprehension of being thought affected by cynics that he was most delightful. Under many difficulties imposed by nature and fate he carried out his duties in an exact way, and he will be regretted by all who enjoyed the blessing of his acquaintance as one of the best of men.

THE titles of some of his pictures in the order of their appearance in the Royal Academy will indicate his efforts to win success. Beginning with 1857, we find "Arrest of a Poacher," "Canvassing for a Vote," "The Patriot Wife," an Austrian scene, "A Rehearsal of Music in a Farm-house," "Sir Thomas More's Daughter in Holbein's Studio," "Return of Sir Francis Drake from Cadiz," "First Sight of the Armada," "Queen Elizabeth at Purfleet," "Taking Home the Bride," "Jewess accused of Witchcraft," "Evensong" (interior of Tong Church, Shropshire), "Chinese Ladies and European Curiosities," "Roman Trireme at Sea," "Arab Story-teller," "Arab Prisoners," "The Basha's Black Guards," "Arab Shepherds," "The Outpost," "An Arab Patriarch," "Army Reorganisation in Morocco," "The Snake Charmer," "A Fair Customer," "Jack Ashore," "A Tunisian Bird-seller," "A Needy Knife-grinder," "Returning the Salute," "Oddfish," "A Barber's Shop in Tunis," "The Talisman," "A Cockfight," "The Turn of the Tide," "The Temple of Diana at Zaghuan," "Better have a New Pair," "Following the Plough," "Commercial Activity in the East," "Pampered Menials," "Relatives in Bond," "An Eastern

Question," "Loot," "The Pacha," "Say what shall be my Song to-day," "I'll serenade no more," "Gehazi, the Servant of Elisha," "The French Naturalist in Algiers," "Homeward Bound," "Bound for the Black Sea," "A Shipwrecked Sailor waiting for Sail" (diploma work), "A Day Far Spent," "Ilka Lassie has her Laddie," "Painter and Critic," "Hobbema's Country," "In the Low Countries," "Ragassellma: the Water Dance," "Robert Burns at the Plough."

UNLIKE Mr. HODGSON, his fellow-academician, HENRY MOORE, who died in Margate on Saturday morning, was most restricted in his class of paintings. The heads in profile or the corpses lying at full length, by M. HENNER, were not more easily recognised at a distance by visitors to the Salon than were Mr. MOORE's seascapes in Burlington House. They were generally of a bright blue, and the waves were shown as they appeared on days of sunshine. A stay-at-home traveller looking on them must believe that what was said about the terrors of the Channel was exaggerated, for water that was so placid seemed unlikely to strain the smallest boat. His pictures were like an argument against the Channel Tunnel. But the public were gratified by the repetitions, otherwise Mr. MOORE would not have persisted in his treatment. His landscape in this year's Academy suggests how admirably he could paint in a different manner if he were free, but patrons and dealers are exacting. No one could suppose he was insincere in his work. Mr. MOORE preferred to look on Neptune in one mood, and what he saw he recorded. Like his brother ALBERT, he believed repose was an advantage in art, and the idyllic figures of one artist would be the most fitting voyagers on the quiet waters which the other painted. It must have been a happy home in which they were both reared to have perfected so peculiar a temperament in them. During many years they had to be patient, while inferior artists were accepted by the Academy as their superiors. Yet the slights did not affect their art. Both went on painting as if they lived in Arcadia or some other ideal world, and at the close of their career they seemed hardly to have once tired themselves. The best tribute to their ability was that everyone considered they were capable to produce works of a different class, and superior in quality, to any which bore their names.

It is wrong for a clerk of works to pose as an architect, but as any man or woman can do so with impunity the offence is not unpardonable. But if in addition he poses as a building owner the law will not spare him. That has been the experience of a clerk of works at Scone, in the North of Scotland. He ordered a firm of painters to execute some work at a villa, and as he would not pay it was necessary to bring an action against him. His plea was that he was the architect, and as he disclosed the name of the principal he could not be held liable. The sheriff decided there was no disclosure, and in consequence a decree was given against the clerk of works, and the builder who joined with him in the action. The case has a moral, for if an architect does not explain clearly for whom he is agent, he must be treated as a principal, and have all the privileges attached to responsibility.

AN interesting case on account of its novelty is now before the Irish Courts. It comes in the form of an application to make absolute a conditional order for a writ of mandamus directed to Mr. BRETLAND, surveyor, of the City of Belfast, to compel him in his official capacity to approve of certain plans of buildings proposed to be erected on the south side of North Street, Belfast. The Corporation had acquired grounds and buildings for the purpose of widening North Street, and Mr. ROBB, the relator in the case, was conveyed a plot, one side of which was bounded by a laneway, at a yearly rent of 400*l*. He proposed to erect two shops on this plot, and the plan showed windows overlooking the laneway. The city surveyor refused to approve of the plans, on the grounds that, if carried out, they would interfere with the erection of buildings on the adjoining property, and would also interfere with the line of the new street.

ILLUSION IN PAINTING.

EVERY picture must to some extent give rise to an illusion, for otherwise it would not produce much effect on the mind of a spectator. For a moment we imagine, with a little vignette of TURNER before us, that we are looking at a wide region of country and sea, hills and valleys, trees and streams illuminated by sunshine. It hardly needs any exercise of reason to be convinced that we are really gazing on a scrap of coloured paper a few inches square. The magic of a great artist like TURNER compels us to forget the actualities of space, just as an artist in literature can persuade us by means of written or printed characters that we have real men and women not only talking but suffering before our eyes. We need not be ashamed when we are deceived by books or pictures like those of SCOTT or TURNER, for our reason is subjected by the power of genius. But there is deception of another kind which is not accompanied by any satisfaction. A man with trained intellect, if he were not aware of the facts, might give credit to DEFOE's narrative of Mrs. VEAL's return from another world, or at least believe in its sincerity, but he would not be easily taken in by a circumstantial account of a miracle wrought by means of a patent medicine. Yet the two literary efforts are alike in character; one was intended to puff an unsaleable, because it was a worthless, book, the other puffs drugs that, if worthless, are generally harmless. If a visitor to the Brussels Gallery on a winter's day were puzzled at seeing the little ladybird in M. ALFRED STEVENS's charming *Bête à bon Dieu*—which is, as everybody knows, a portrait of a comely dame—his critical acumen would hardly be affected; but if he were frightened for a moment by the dog starting from his kennel in the WIERTZ Musée in Brussels, or ogled momentarily the women looking out of the wall, or pitied the man behind the prison grating, he would be considered no more of a connoisseur than the Flemish boors who find so much enjoyment in the odd but clever collection. If WIERTZ were living he would maintain that he simply performed on a grand scale the same trick which the fashionable portraitist attempted on an insignificant scale with his ladybird.

Both artists could justify their conduct not only by Flemish precedents, but by some derived from the great periods of art. ZEUXIS has gained as much renown by the story of the birds that tried to peck the grapes in his picture as by the merits of his *Helen* or his *Family of Centaurs*. If ZEUXIS were competent to deceive men and birds, he could be also overcome, for he took a curtain painted by PARRHASIUS for a genuine piece of weaver's work. Every Academy student is bound, if he be anxious to attain membership, to put his faith in REYNOLDS's Discourses, in which the wisdom of the CARACCI as guides is expounded. ANNIBAL exhibited wisdom when he acknowledged his own weakness of vision. "BASSANO," said the Master of the Eclectics, "performed miracles which surpassed those recorded of the Greek masters. They deceived beasts, but he deceived men, for I can testify that one day when I was in his room I tried to take up what appeared to be a book, and to my astonishment I found that my hand touched a painting." There was no reproof or warning expressed by ANNIBALE CARACCI; he considered rightly that a man must have extraordinary power of handling who could produce so successful an illusion. The majority of the Greco-Roman, if not the Greek, artists would agree with him. How many paintings are found in Pompeii which were evidently intended to deceive all who looked at them? Triptychs are represented with leaves at different angles; delicate architectural structures appear to stand out from the walls, and to reveal glimpses of landscapes through the columns; phantom feasts are laid as if ready for guests. Strictly speaking, Pompeian art of that class is not of much higher value than the chalk drawings on London pavements; but as shrewd Cockneys take more pleasure in looking on the cuts of bacon and salmon which are produced before their eyes than on the masterpieces in the National Gallery, we must not be too hard on the masters of the world if they admired the freaks of perspective on the walls of their villas.

It is not sufficiently understood how close is the relation between breadth in the genuine sense of the word and those sleight-of-hand effects which produce illusions. One sees a flowing white beard in a portrait by REMBRANDT,

and the hairs appear as if they could be counted. But when scrutinised closely the beard is found to have been produced by two or three strokes of a large pencil. The portraits by the pre-Raphaelite artists, on the other hand, which were elaborately worked out, were as little illusory as the diagrammed figures of the Science and Art Department. Occasionally Mr. HOLMAN HUNT exhibits a portrait in the old way, but, enormous as was the work expended on them, nobody could confound any of the accessories with realities, and the countenance is not suggestive of what is commonly called "a speaking likeness." Mr. RUSKIN was therefore backing his friends when speaking of portraiture in general—that is, of external nature as well as of man—he said, "It is possible to represent the body without the spirit; and this shall be like, to those whose senses are only cognisant of body." It is not with spirit the producers of illusions attempt to meddle.

Most of the illusions in painting are intended to express body in a way that will reveal thickness and solidity as well as the length and breadth which logically should be the only attributes of a representation on a plane. The legendary grapes, curtains, books, flies, are all examples. When CHARDIN and OUDRY competed in the imitation of a bas-relief, at first sight both works were considered to have equal merit, for both had to be touched in order to gain certainty they were paintings. OUDRY, who was the inferior painter, was more dexterous in producing effects, although his proportions and contours could not sustain comparison with his rival's. Now this solidity is only obtainable by skill in treating light and shade. The paintings by WIERTZ in Brussels have many defects, and anyone who is acquainted with masterpieces will find it difficult to give much attention to them. Yet in all of them there is powerful if misapplied light and shade. Not one of the figures represents a being in whom it would be possible to take any interest; but, dislike them as we may, there is no denying they are more obtrusive than the majority of painted things. A curator of the gallery is therefore to be pitied, for the terrible beings he sees daily must soon appear to have more vitality than himself, unless he has acquired sufficient knowledge to discover the falsity of the painter's system, when he is sure to despise the chimeras, which are only the creations of a mind diseased.

The painter is able to gain delusive effects because light and shade is so often a conventional arrangement. Light can be supposed to fall at any angle, and to have as much intensity as is desired. Chiaroscuro is, in fact, an affair of logic, a drawing of conclusions from assumptions, and as long as there is apparent consistency throughout in its treatment a picture becomes satisfactory in that respect. If some parts of a picture were in accordance with the illumination of Morocco, and others were derived from what is commonly seen in London, the incongruity would be as striking to ordinary intelligence as the combining of a lion's head with a horse's neck. It may be objected that REMBRANDT's chiaroscuro is unnatural because it is unlike CAGLIARI's, and that CORREGGIO's system is absurd if compared with VELASQUEZ's; but as long as each artist is consistent to the principle he adopted on setting out, his works become effective. Let unity be disturbed by an endeavour to combine two systems, and the picture will have a distressing effect upon all who see it.

As a rule painters avoid the human figure when they decide on deceiving spectators. In some panoramas figures cannot be avoided, but *vraisemblance* is gained by a skilful use of accessories that are real. The painting of a wounded soldier, which by itself would be commonplace, becomes pathetic when seen through the wheel of a wagon and surrounded with some of the débris of a battlefield. It is related that COYPEL, the French painter, was able on one occasion to compel people to salute a portrait he had painted as if it were the subject. But the circumstance is no proof of extraordinary ability. The portrait was placed near a table so as to suggest a man seated, a favourable hour was chosen for the exhibition, and drapery was arranged to diminish the risks of discovery. COYPEL acted like the proprietors of the portrait of St. VERONICA's veil exhibited some years ago in Pall Mall. The eyes appeared to open and close with a regularity that was painful, but without the draped chamber and the carefully subdued light the phenomenon would not be apparent. To the

multitude it was more marvellous than the eyes in portraits, which appear always to be turned towards the spectator. They surprise some simple people, but we never heard of a burglar who turned aside scared from an example, or from the eyes of a gallery of portraits, no matter in what direction they looked.

It is astonishing how soon effects which are startling become tiresome. Like imitations of peculiar sounds in music, or of lace and other transparent fabrics in marble, they are destined to bore those who were first surprised. On that account we have often admired the tact of Mr. ALFRED STEVENS. If he tried to deceive, at least it was in a venial manner, and the most rigorous judge if power were given to him would not decree the removal of the little beetle. If all illusions were as innocent it would be fortunate for art.

THE WESTMINSTER BASILICA.

ALTHOUGH the laying of foundation stones is not, fortunately, a rare occurrence, it may be assumed that very few of the laymen who will be present at the ceremony in Westminster which is to take place to-morrow are likely to again witness a similar sight. The Truro Cathedral is the only building of its class which was erected by the Church of England since St. Paul's was completed, and the interval which separates St. Paul's from the latest of its predecessors is also long. The Roman Catholics on account of poverty can only indulge in the gratification of erecting pro-cathedrals, and the financial history of the Kensington building is not encouraging for those who wish to take part in similar undertakings. In spite of extraordinary offerings like the Manning Testimonial Fund, the existing pro-cathedral, because of its indebtedness, cannot be consecrated. It might be assumed that shrewd men of business like Cardinal VAUGHAN and his advisers would hesitate about erecting a new cathedral until the debt on the building that served and can still serve for all episcopal functions had been cleared off. We have no wish to say one word which would be an obstacle to the erection of new cathedrals throughout England, but everyone with experience in building is aware that whenever an important work falls quickly under the stigma of mortgage, it becomes a warning which prevents people from entering upon less uncertain speculations. For the sake of architects and builders in general we therefore trust that none of the Benedictines who are to be installed in the new basilica will have to suffer martyrdom from duns, which, according to rumour, has been the fate of more than one of the administrators in Kensington.

The proposed building is another instance to show how much importance can be attached to a name. When the Roman Catholic dioceses were arranged in the Papal Court about forty years ago, care was taken to avoid, whenever possible, the assumption of the titles of the bishops of the English Church. As there was a Bishop of London and a Bishop of Rochester, the heads of the new metropolitan dioceses were designated Archbishop of Westminster and Bishop of Southwark. It is requisite that episcopal titles should have a geographical basis, if it were only *in partibus infidelium*; otherwise Westminster is now too circumscribed to express the wide region which is comprised within the boundaries of the arch-diocese. Whatever signification may be attached to the title, a sense of fitness would dictate that a cathedral in London should be in a central position. One of the objections to the Kensington building arises from its suburban and West End site, which is supposed to make it unfitted to be considered as the church of the Metropolis. There are of course numerous associations with Westminster, but the most imaginative archaeologist would hesitate to say they extended as far as the end of Victoria Street and Vauxhall Bridge Road. No doubt it is an advantage for an archbishop to be near the Houses of Parliament, and, according to Mr. LUCY, at one time "the spare figure of Cardinal MANNING, with his pinched, bloodless, intellectual features, was as familiar in the lobby as that of the average member." That cause might serve for the selection of a site in the rear of Victoria Street as a residence. But it is not reasonable to conclude that such a spot is most suitable for a cathedral, for in very few cities of Europe are the bishops to be found living near

their chairs. From a surveyor's point of view, the single advantage which appears to belong to the site arises from the proximity of the Victoria Station, which will bring it into communication with various parts of the diocese.

If there is a mystery about the selection of the site, there is another attached to the selection of a style. We need hardly say there is no official or prescribed style for Roman Catholic churches. Nor was there one at any time. There were always contests enough in Rome without entering on a battle of styles. As a corollary it follows that no style is prohibited, and as mosques have been utilised for churches in Spain there would, we suppose, be no difficulty about the dedication of a new church which had been designed in the Moorish style if the symbols were omitted. For everything ancient there is a kindly feeling among the Vatican authorities. Cardinal NEWMAN wrote a pregnant passage on this subject. "What the Catholic Church once has had," he said, "she never has lost. She has never wept over, or been angry with, time gone and over. Instead of passing from one stage of life to another, she has carried her youth and middle age along with her, on to her latest time. She has not changed possessions, but accumulated them, and has brought out of her treasure-house according to the occasion things new and old. Things incompatible in nature coexist in her; her prose is poetical on the one hand, and philosophical on the other." When the late Cardinal obtained an opportunity to erect a University chapel he acted on the principle he expressed, and out of the "treasure-house" of styles selected the basilican. The building had as much success as was to be expected from the novelty of its parts, especially as they were arranged by the hands of an amateur architect, but it attracted no students to the neighbouring class-rooms. They may have thought that a church in which an exterior space or vestibule was reserved for catechumens (if any could be discovered) was a type of the system of education that was founded on theology, and not adapted for secular students who were not initiated into things which are outside a prosy and material world.

That the basilican style was well adapted for use during one period of the history of the Church there can be no question. According to MACAULAY, the Roman Church is the masterpiece of human policy, and never was that policy more apparent than in the utilising of basilicas. They served so many purposes, it would be hard to say which was the primary one. They were law courts, exchanges, bazaars, assembly-rooms, but as well as can be made out they never served as temples. In size and proportion they varied, but the normal plan was to have a nave or testudo with an aisle or porticus on each side, the tribunal being at the side opposite the vestibule. According to the recipe of VITRUVIUS, the breadth was not to be made less than the third nor more than half the length, unless the nature of the place was against either proportion. Each porticus was to be one-third of the width of the nave, and its lower division was to be as high as it was broad. For the porticus consisted of an upper and lower part, and, as the upper was enclosed for most of its depth, the occupants could not be seen from below.

When it became necessary to provide places of worship for Christians, there would be nothing extraordinary in allowing them to increase the purposes for which the basilicas were used by holding services at times when they were not needed by litigants or merchants. We cannot believe that public or private basilicas were generally made over to the Roman clergy and congregations as soon as Christianity ceased to be persecuted. The Christians had also gone through a course of discipline which would teach them to accommodate themselves to circumstances. It would indeed be preferable in one sense if the basilicas before or after the religious services continued to be employed as law courts, for which apparently they were originally designed. We can easily imagine how more influential a body of mysterious zealots who claimed power of binding and loosing of souls would appear if they sat on the judgment seat of the Old Bailey, especially to a congregation of Whitechapel neophytes. The rigorous penances imposed would seem to be righteous. The absolution would be the removal of a load as oppressive as CHRISTIAN'S when he set out on his pilgrim's way. The clergy sat upon the tribunal of the basilicas and faced the

people. There they presided over the commemorative rites. It should be remembered that a coena or supper was celebrated, and by arranging themselves around three sides of a table, which could be done within the tribunal enclosure, more resemblance was given to the Roman practice at meals. The curved end was not to be always found in Roman basilicas, nor was it indispensable for the performance of the Christian mysteries. When the office of the bishop assumed greater importance it may have been supposed that his chair became more effective with a semi-circular background.

In course of time the power of the unseen was, we may imagine, more irresistibly felt when it was not supposed to be personified by a few humble men. As soon as the clergy ceased to gaze on the congregation from behind the altar the basilican style diminished in importance. Every rectangular church having a nave and aisles, with or without galleries, must have much in common, but a basilican church was a spiritual although public place of justice, and as the infliction of sentences became less public it was no longer necessary to retain its form. Nor was the basilican an elastic plan. It was adapted mainly to a single-altar arrangement, and Gothic and Renaissance plans were more conformable to developments of practice. If we remember aright, Dr. NEWMAN respected precedent, and introduced only one altar in his basilican church, but at Westminster we suppose the more modern arrangement of a number of chapels and altars will be adopted. The putting forth of the church of St. Ambrose in Milan as one of the models points to that end, for it has an abundance of chapels; but, interesting as its history is, it has been truly described to be "a chaos of architecture," and it represents the growth of centuries, the adaptations produced by doctrinal development. It is the most complex of guides to follow for a nineteenth century church. One of the characteristic features of the building, or group of buildings, is the fore-court, but of what use would be a copy for a modern London church?

The practical advantages of the revival of the basilican style are, therefore, not manifest. To suit the Roman ritual there must be departures from the original simplicity of plan, and the unity of the style will therefore be broken. Is the quaintness or novelty worth so great a sacrifice? It may be said that in Munich there is the basilica of St. Boniface. Munich is, however, a city of reproductions, and it would be remarkable if an example of so historic a type of church architecture were omitted. Besides, it was considered that a building in that style would supply an ample field for the wall-painters, who, the King of BAVARIA fancied, were equal to a chapter of theologians. The basilica is spacious, without dim religious light in any part. From the elevation given to the high altar the ceremonies can be seen by all, and marriages when celebrated at that altar assume a little dignity. But in some of the modern French churches—the Trinité in Paris being one—as much effect is gained, and there is no clashing between antiquity and modernity. The Paris church is logical throughout, and there is no endeavour to gain importance by anachronisms. Men and women feel it is in relation with their everyday lives rather than with a vanished world. Why is not the opportunity taken for a similar experiment in London? Are Churchmen to be always in terror of modern ideas, and are bricks which are not arranged in stock patterns to be anathematised? Mr. BENTLEY'S Gothic work proves him to be a master in the art. We may assume that his work at Westminster will be as excellent as circumstances permit, but he will be hampered by conditions which are not conducive to that liberty which is requisite in the production of all noble art.

At the Meeting of the Wolverhampton Board of Guardians, the workhouse accommodation committee presented a report with regard to providing additional accommodation. The conclusion they had come to was that it was desirable that the opinion should be obtained of an experienced architect. They had, therefore, unanimously resolved to ask the Board to empower them to instruct Mr. W. H. Ward, Birmingham, to inspect the workhouse at a fee of thirty guineas, and report as to the practicability of reconstructing, altering and enlarging it on the present site so as to provide accommodation for 1,200 inmates.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. F. C. Penrose, president, in the chair, the business being to confer the gold medal on Mr. James Brooks.

Royal Gold Medal.

The PRESIDENT, in his address, said:—The first and very agreeable duty which we have before us this evening is, as you are aware, that of handing, in Her Most Gracious Majesty's name, the royal gold medal to the man of your choice. He is an architect whose works fully entitle him to receive it, and we may feel the greater pleasure in conferring the honour because the recipient is one of our own body. The Institute has so fully endorsed the recommendation of the Council that it implies a thorough appreciation by the general body of the reasons which led the Council to make that recommendation. I may, therefore, perhaps be thought to be going over ground so well known to the members who are present as to be of the nature of an unnecessary performance in recounting them. As, however, the proceedings of this evening will be reported far and wide, both in our journal and in other publications, it may be desirable to mention some details which cannot but be interesting to outsiders. Mr. James Brooks, on whom Her Majesty this year confers the honour of the royal gold medal, is a native of Berkshire, from the neighbourhood of Wantage. He came to London about 1847 to study for our profession, and became a pupil of the late Lewis Stride, a fellow of this Institute. That he was a diligent worker in the office goes without saying; he also attended Professor Donaldson's classes at University College, and became in due time a student of the Royal Academy, and attended the professional lectures. He commenced practice on his own account about 1852; at first, as was natural, in a comparatively humble way, but soon established for himself the career in which he has been so much distinguished, and in which he has enriched the neighbourhood of London, and also many country districts, with some of the handsomest ecclesiastical structures which have been erected during the last thirty years. A complete list of these buildings would be very extensive, and lead me to a length far beyond what the occasion requires. I therefore select a very few from among the most striking examples, placing them approximately in the order of their dates, namely:—The Convent Schools and Chapel of St. Michael, Shoreditch, 1863; St. Margaret's, Lee, in Kent, 1876; St. Peter's, St. Leonards-on-Sea, 1883; St. Mary, Hornsea, 1888; St. John the Baptist, Kensington, 1892. It is evident that much valuable study and successful practice must have preceded the first during the ten years which date from 1852 as above mentioned. And we may hope that the last named on the list may be succeeded by a goodly following by the same hand. The style of architecture which Mr. Brooks has chosen for the majority of his churches is either the Lancet, or else the Transition into Curvilinear which succeeded it. In a few instances (one of them being the church at Hornsea referred to above) the Perpendicular style has been used very effectively. The treatment is invariably vigorous, and with a simplicity somewhat bordering on severity, particularly as respects the exteriors. This, however, is not the place to criticise but to praise them, and they are worthy of it. Mr. Brooks's fame, no doubt, rests mainly on his ecclesiastical designs; but they are by no means his only achievements. Among his works may be cited a large brewery, an hotel, many secular buildings, two hospitals in connection with sisterhoods, extensive and sumptuous stables built for the Marquis of Londonderry, labourers' cottages and gentlemen's mansions, one of the most remarkable of these being in South Africa. Mr. Brooks is architect to the Diocesan Society of Canterbury, and is one of the consulting architects to the Incorporated Society for Building Churches. Lastly, I feel sure of having your united concurrence with me in the act of handing to our distinguished colleague this royal recognition of his merits as an architect.

The President then conferred on Mr. Brooks the Royal Gold Medal.

Mr. BROOKS, in replying, expressed his gratitude to the President for his kind but too flattering remarks made on himself and his works as an architect, in presenting him with Her Majesty's gift, an honour enhanced in value by its coming to him on the recommendation of his brother architects, members of the Institute. He felt keenly his position that evening. His mind carried him back to the distinguished men in the past who had occupied the same position he then occupied. He remembered quite recently the refined and polished address of Sir Arthur Blomfield, the no less refined address of M. César Daly, the manly address of our American friend and architect, Mr. Hunt, and last but not least Sir Frederic Leighton's learned and comprehensive address. Though he had not the gift of oratory, he felt as deeply as anyone the honour so graciously bestowed upon him. He would prize the medal immensely, and treasure the numbers of con-

gratulatory letters he had received from noblemen, gentlemen, and his brother architects. He imagined most architects had at times felt great depression—at all events he had when he compared his work with those great masters who had left them such great monuments of architectural skill. He had felt it would have been better for history had he chosen a more humble position in life than the masterly calling of an architect. In studying the old cathedrals he had felt what a gulf existed between the works of the old architects and his own work. He attributed many of his own shortcomings to the fact that when he first came to London no systematic training was provided for young men who wished to follow the architect's profession. There was no such practical guidance as was now given by the Institute, where students could carry on their studies and test their knowledge by the process of examination. Of course anyone might pass these examinations, but it would not qualify them to become an architect. It was only a means towards an end. It was necessary for a man to be a born architect in order to succeed in the profession, but the training which that Institute afforded was the means of saving many years in a man's life, and enabling him to get on in a much shorter space of time than was formerly possible. At all times he had tried to do his best, and so long as he was permitted to use his pencil he would try and maintain the position awarded him. This was not the first honour awarded him by the Institute, for all which he tendered his sincere thanks.

The proceedings then terminated about nine o'clock.

COVENTRY MUNICIPAL BUILDINGS.

THE estates committee of the Coventry City Council presented at the meeting on Tuesday the following report, which had been received from Mr. Charles Barry, the assessor appointed to assist the Council in the conduct of the competition for designs for municipal buildings.

The committee inspected the designs submitted, ten in number, and recommended that the premiums be awarded as recommended by the assessor.

Mr. Barry says:—I have carefully inspected the designs sent in, and may preface my report by saying that many of them display much ingenuity in dealing with a very irregular site and with the ancient buildings to be retained, and that consequent on such ingenuity it has been found possible by most of the competitors adequately to provide the accommodation required in the instructions, and which have been satisfactorily complied with generally.

I have selected three designs, and advise the Council to award the premiums to them in the following order:—For the design marked "Leofric the Saxon" the first premium of 150*l.*, for the design marked "Red Crescent" the second premium of 50*l.*, for the design marked "Advance" the third premium of 50*l.*

All the above have been carefully adapted to the area and peculiar shape of the site, and with each design there is a detailed report, dealing carefully with the several points referred to in the instructions, to which I invite the attention of the committee.

No contemplated cost was named in the instructions, and the competitors have treated this question by using various rates per foot cube in making up their estimates.

The authors' estimates of the above three designs are as follows:—Leofric the Saxon, 33,668*l.*; Red Crescent, 33,519*l.*; Advance, 27,891*l.*

The cubes sent in by the authors, as required by the instructions, have been carefully checked, with the following result:—Leofric the Saxon, author's cube, 872,264, cube as checked, 924,681; Red Crescent, 922,700, 948,451; Advance, 979,387, 804,604.

It will be noted that the cubes of the two first designs, as submitted by their authors, are rather understated, though not to a material extent.

The cube submitted by Advance is, however, larger than from the drawings I find it to be.

I think it would not be safe to estimate the new building at a less rate than 10*l.* a cube foot taken all over, but as to this the Council will no doubt be advised by their officer, the city surveyor, who would necessarily have more local experience as to cost of buildings in Coventry than I have. But assuming that a rate of 10*l.* a foot is fairly correct, the probable cost would work out thus: Leofric the Saxon, 37,695*l.*; Red Crescent, 39,519*l.*; Advance, 33,525*l.*

It is right, however, to say that though the design Advance is, in my opinion, good in arrangement and of considerable merit in design, and therefore deserving of a premium, the author has taken, as I think, too small a ratio for the sizes of many of the apartments, and if this design was to be executed I think its cube contents would have to be somewhat enlarged, and its cost would probably then approximate to that of the other two designs I have named.

In order to illustrate this and to enable the Council the more easily to compare the plans, I append a table of certain

particulars of the accommodation provided in each of the three designs, which has been the result of careful examination and comparison.

I have no hesitation, however, in expressing my opinion that the design marked Leofric the Saxon is decidedly the best of all those sent in.

It could be carried out readily in sections as required (see the author's report on this point) with little, if any, derangement of business. The warming and ventilating arrangements have received very careful attention, and in an artistic view this design would harmonise better than most others with the old buildings of St. Mary's Hall, which are in any case to be retained and to form part of the municipal buildings of the future.

Alderman Tomson, in proposing the adoption of the report, said the passing of it would bind the Council to pay the awards in the order in which Mr. Barry recommended them—150*l.* to the first and 50*l.* each to the second and third—and also to employ the successful architect whenever they made any use of the plans for the purpose of building any part of the municipal buildings.

Mr. Drinkwater seconded the adoption of the report.

Mr. Andrews asked how far the committee's report committed the Council to carry out the scheme. The police station comprised about one-half of the whole block. The estimated cost was 38,000*l.* Consequently the police portion would mean an outlay of 19,000*l.*, which, with architects' commission and furnishing, would bring the cost up to something like 25,000*l.*

Alderman Marriott said the question before the Council was that they should pay the premiums.

The report was adopted.

It was then found on opening the sealed envelopes that the plans bearing the motto "Leofric the Saxon" were those of Mr. H. Quick, Coventry; "Red Crescent" those of Mr. H. T. Hair, London; and "Advance" those of Mr. H. W. Chattaway, Coventry.

VERULAMIUM.

AT the last meeting of the St. Albans Architectural and Archaeological Society, Mr. W. Page, F.S.A., read a paper entitled "Notes on the Remains of Verulamium." In the course of it, according to the *Herts Advertiser*, he said he would endeavour to place before them the leading events in the history of Verulamium. It would be remembered, he said, that Britain was invaded by the Romans under Julius Cæsar in B.C. 54, although a landing on the coast had been effected shortly before. The defence of this island was led by Cassivellaunus, Prince of the Cassi tribe, a part of whose territory was the county of Hertford. It was soon found impossible, however, for the ill-disciplined natives to bar the progress of the Roman legions, and having crossed the Thames, as it is said, Cæsar marched upon the principal town of Cassivellaunus, described as surrounded by woods and marshes, and which is by some considered to have been on the site of Verulamium. This he took by storm, but Cassivellaunus continued his resistance till finding all opposition futile, he eventually submitted, and Cæsar having made Britain a tributary of Rome, retired with his army into Gaul. Little is known of Britain or Verulamium for nearly a century. We learn from the researches of Sir John Evans and Mr. Birch that coins of the native prince Tasciovanus were struck at Verulamium shortly after, which clearly shows that the British town of Verulamium was then of some importance, probably the most important of Southern Britain. The country was pretty well under Roman dominion by a little after the middle of the first century. The Roman cruelties towards the conquered inhabitants brought about the revolt of the Icenii tribe under their Queen Boadicea, who, after taking Camulodunum, which had been settled by a company of Roman veterans, took and destroyed Verulamium, which had become a Roman town, and is said to have put to death 70,000 Romans. The insurrection was soon quelled, but not till after much blood had been spilt, if we may judge from the numbers who are stated to have fallen in it. At this destruction of Verulamium probably all remains of the city of the Cassian princes was completely swept away and the entirely Roman city of Verulamium afterwards arose. The Romans remained the rulers of Britain down to A.D. 410, when, after having withdrawn the Roman legions, Honorius sent letters to the cities of Britain recommending them to provide for their own safety. For over 350 years, therefore, Verulamium remained a Roman city. In such a length of time probably all the houses would have been rebuilt several times, especially as in the construction of Roman buildings wood was largely used, but the foundations appear to have been made to last for ever, as it is with the greatest difficulty that the pick can now destroy them, although it is some 1,500 years or more since they were made. After the departure of the Romans Verulamium was taken by the Northmen in A.D. 465 and retaken by Uther Pendragon, and in the sixth century it was finally taken and destroyed by the

Angles. It appears, therefore, that the city was occupied for about 100 years after the Romans left it. The area of Verulamium has been variously stated, but I have worked it out from the ordnance map and find it to contain 188 acres within the walls, not including the foss or fishpool. It is in all probability the largest Roman city in Britain, but the area of some of the Roman cities not having been ascertained, it cannot be said with certainty to be so. Silchester, which was an important city, contains only 100 acres. The walls entirely surrounded the city and can be traced with more or less distinctness on every side except the north, adjoining the fishpool or lake, where, however, the foundations have been discovered at different points. It is possible that as the city was well protected by the fishpool on this side, the walls were not of so substantial a character, and therefore not so capable of resisting the ravages of time and humanity. The foundations shown here by Mr. Grover measured 6 feet wall with 2 feet footing, whereas the wall at Gorham Block is stated by Stukeley to have been 12 feet in thickness. The wall is composed of four layers of Roman bricks, the lowest layer having four courses of bricks, the mortar between them being equal to their thickness; the second layer had three courses of bricks, and the two uppermost layers two courses. Between each of these layers is about 2 feet 8 inches of a sort of concrete composed of large flints and mortar. The Roman bricks vary from $1\frac{1}{2}$ inch to $1\frac{1}{4}$ inch in thickness, and from 12 inches to 18 inches in length and breadth. They are of two kinds, the red of a fine colour and texture, which were probably baked in the sun and called *crudus*, and the others having a red case over a black vitrified substance, which have certainly been burnt in a fire, the black part of which resists a file, and will bear a fine polish. These were called *coctus*. Except on the north side, where was the fishpool, the walls had immediately outside them, as was usual in Roman cities, a foss, about 150 feet across, which, on the south side, is double, and it has been suggested is of ancient British construction. It is difficult now to form an opinion as to the height of the walls; the remains are too incomplete to estimate with any degree of accuracy. The height was not, probably, regular, the walls on the north side were not of equal height to the rest, and the remainder probably differ at various points. There are holes in the wall at St. German's block, which Stukeley says in his time were round, and appears to think the walls were built with them, but from their appearance now it looks rather as though they had been caused by natural decay. Although the walls are now almost the only remains of the Roman city above ground, they have suffered perhaps nearly equally with the remainder of the Roman buildings by the utilitarian hand of mankind. Old Stukeley, in his "Itinerarium Curiosum," published in 1776, says that "three years ago a good part of the wall was standing, but ever since, out of wretched ignorance, even of their own interest, they have been pulling it up all round to the very foundations to mend the highways, and I met hundreds of cartloads of Roman bricks, &c., carrying for that purpose as I rode through the old city, though they have stone cheaper." Although they did not have such a gross tale of vandalism to tell at the present day, yet the older inhabitants tell him (Mr. Page) that there is not half the wall remaining that they can remember, and he dare say many of them had seen the youthful Albanian expending his superfluous energy in the Abbey Woods on a Sunday afternoon in trying to destroy the little that now remains. It certainly seemed a great pity that these intensely interesting remains of the Roman occupation of this country, after braving the elements for over fifteen hundred years, should be allowed to be now ruthlessly and wantonly destroyed. There were four gates to the city, viz. the north, south, east and west. Stukeley also shows a gate at the south-east corner, which he calls the south gate of the city, and Mr. Grover, in his plan, also follows him, but there does not seem to be any reason for or indication of a gate here. On Mr. Grover's plan there is a note that this south gate—he meant the one at the south entrance of the Camlet Way—was visible to the year 1700, and Mr. Ashdown told him (the speaker) that he had found indication of both this and the east gate. The gates were probably protected by towers on each side containing guard-rooms and other accommodation for soldiers. The two principal roads running through the city were Watling Street, which commenced at Rochborough, in Kent, and went through London and entered Verulamium by the east gate and passed out at the west gate and so on through the Midlands to Chester. A line of trees still marks the site of this road through the Roman city. The other road passing through the town is called by Mr. Grover the Camlet Way, which came from Silchester or Calleva, and entered Verulamium at the south gate and passed out on the opposite side, crossed the fish-pond by a bridge or ferry, and probably joined on to what is now called Green Lanes, and so on to Sandridge. The positions of both these roads were identified at the time of the excavations of 1869. The city was traversed like all other Roman cities, according to the discoveries made in the excavations of 1869 by streets running parallel to one another.

Of the buildings of Verulamium, other than the theatre, they knew practically nothing. Whenever excavations have been made, no dimensions or details of the buildings uncovered have been kept, even their positions in many cases can only be guessed. As early as the eleventh century excavations were made by two successive abbots of St. Albans, Ealdred and Eadmer, who, he regretted to say, carried them out with the idea of destroying the then existing remains of Verulamium, rather than preserving them, the reason alleged being that the ruins harboured thieves and other lawless persons. It is said that the subterranean passages and caves, meaning probably the drains and heating chambers of the Roman houses, were filled up, and excavations were made in order to find stone and brick for rebuilding the abbey. It is also related how they came across a palace, in which were discovered a number of books and rolls; these with the exception of one, the life of St. Alban, were committed to the flames as being idolatrous. The one preserved, the credulous Matthew Paris told them, was translated into Latin by order of the abbot, and immediately after crumbled to pieces. They were also told that the ruins of temples and altars were destroyed, showing that at that time the remains of Verulamium above ground must have been pretty extensive. The speaker also referred to the many excavations that had been made on the site of Verulamium, illustrating his remarks by a plan.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual excursion of this Association took place on Saturday last to the Island of Bute. Travelling from the capital via Gourock, Rothesay was reached early in the day. Here the party, which numbered some forty gentlemen, was met by Mr. J. Windsor Stewart, factor to the Marquis of Bute, who accompanied it in the drive to the places of interest visited. Driving across the island to the southern shore, St. Blane's Chapel was first inspected. Mr. R. Rowand Anderson, LL.D., president of the Association, who acted as leader of the party, explained that this ruin, which stands on an eminence near to the shore a few miles to the west of Kilchattan Bay, has been the subject of a good deal of archaeological speculation. A careful examination of the building showed that it was practically of one period, the early Norman. The chapel was believed to have been built about the year 1100, towards the close of the reign of Malcolm Canmore. The only change in the style of the building was a repair to the choir, which probably took place in the thirteenth century. The party then drove to Mountstuart House, the princely mansion of the Marquis of Bute. It will be in the recollection of some that in December 1877, Mountstuart House, built in the early part of the eighteenth century from plans by an architect named Adam, caught fire, and, with the exception of the two wings, was burned down. The work of rebuilding the mansion was begun in 1879 upon plans prepared by Dr. R. Rowand Anderson, architect, Edinburgh. The new building, which is of red Corsehill stone, externally is all but complete. A clock (illuminated by night) and a peal of bells in the central tower are yet to be put in place. Internally there remains much yet to be accomplished, the work there being of an unusually elaborate character. The new building is in style Gothic of the thirteenth century. The wings of the earlier house are preserved and incorporated in the new mansion, the plan of which is a square. The central part of the house, and indeed the main feature of it, is the great hall and staircase, which are both of marble. In height about 60 feet, the hall is vaulted with wood, which is to be richly decorated, while the staircase is vaulted with marble. The main pillars are of green Chippolino or onion-coloured marble; the capitals are white, the bases are composed partly of Emperor's red and dove-coloured marble, and the arches are of Pavouretta marble. The walls are lined with alabaster. Round the hall is an ambulatory, which is repeated on the floor above. The hall is lighted from the top by twelve windows filled by stained glass representing the Zodiac, designed by a London artist, Mr. Lonsdale, the stars, made of thick clear crystal, being mapped out with astronomical accuracy. The window of the great staircase is filled with stained glass, prepared by the same artist, representing the heraldry of the Bute family. The whole length of the principal floor is occupied by drawing-rooms and libraries, a second staircase, also vaulted in marble, giving access to the garden. On the other side of the building the front is almost entirely occupied by the dining-room, service-rooms and entrance vestibule. The upper floor is entirely given up to bedrooms and dressing-rooms arranged in suites, and on the garden front, commanding an extensive view of the firth, to private sitting-rooms for Lord and Lady Bute. Round these are suites of rooms for guests. There is also an extensive nursery wing, with its own hall, stairs and kitchen. The Turkish bath and swimming-pond are in a sufficiently advanced state to add to one's sense of the completeness of the appointments of this princely dwelling. It only remains to be said that the mansion is lighted throughout by electricity, and that

Mountstuart House is a very successful application of Mediæval architecture to a modern domestic building. It should be mentioned that the roofs of several of the rooms are elaborately carved, painted and gilded. On returning to Rothesay the party, together with Provost Milloy, Rothesay, dined together in the Bute Arms Hotel. Dr. Anderson, who presided, proposed the health of Lord Bute, whom he described as one of the most munificent patrons of art in its widest sense. The toast was enthusiastically pledged. Mr. J. Windsor Stewart responded. The chairman then gave the health of Provost Milloy, who briefly replied, after which Mr. Thomas Ross gave the toast of "The Glasgow Architectural Association," to which Mr. William Tait Conner, architect, Glasgow, responded. The party reached Edinburgh early in the evening. Arrangements had been made by the secretary of the Association, Mr. T. Fairbairn, to visit the castle and church of Rothesay, but time did not permit of the programme being in these respects fully carried out.

TESSERÆ.

The Architectural Garden.

IN designing the architectural garden we must derive instruction from the warning of the past. It must not be so vast as to lose the effect of unity of design and to cause satiety. Every part should manifestly have its use. Balustrades should be employed only where some fence is intended or some protection needed. A balustrade drawn across a plane surface, whose inutility is further marked by the absence of gates where it is intersected by the walks, is an offence against common sense. On the other hand, we remember to have seen the portion of a balustrade removed from a position where it was indispensably needed to prevent the careless visitor from falling into the water, and this merely on the ground that it obstructed the view from the windows. No addition of beauty can justify an absurdity. The contrivances for coolness and for warmth, for shelter and for shade, should be exactly suited to the requirements of the climate and the circumstances of the site. In the grouping the masses of the architecture and arranging the lines of the composition, the laws of the picturesque, that is to say, the laws by which the painter regulates his design, will be found the only true guides. To secure the best effect, a due proportion between the house and the garden should be observed. If the garden greatly exceeds the house in taste and in style, it only furnishes a standard whereby to measure the deficiencies of the object to which it should be subservient. If it greatly falls short of the house in massive grandeur and richness of effect, it suggests a painful idea of disproportion and perhaps too of declining taste and diminished means. The fault is by no means uncommon; the terraces and balustrades of the Crystal Palace are crushed by the weight of the superincumbent pile. When the formal garden is added or restored to some stately mansion it seems to be thought enough that the design should be regular and the decorations architectural. It often appears to have been forgotten that the house is to be seen from the garden, and that the garden should not be inferior in boldness and massiveness of design in order that it may form a fitting base on which the house may rest. Even when the general plan and the architectural decorations are all that can be wished, it not unfrequently happens that the details are disfigured with prettinesses greatly below the general conception. When a magnificent platform is to be filled with flower beds the patterns should be large, and the masses of flowers sufficiently important to aid with the richness of their colour the grandeur of the forms. Intricate scrolls and fantastical flourishes (however beautiful on paper) are meagre and confused in such a position, and the multitude of little columnar shrubs with which it is the fashion to stud the surface are mean and shabby if they grow ill, and, if they grow well, in a few years they produce the effect of crowd and confusion; they obstruct the view and throw a shade of gloom where, above all things, the character of lightness and brilliancy is demanded.

Niello Enamels.

A variety of enamelling is that known as niello, the origin of which goes back to the very infancy of art; for Pliny tells us that silver vessels were ornamented by the Egyptians with a black enamel prepared from silver, copper and sulphur. The art appears never to have been lost, as a ring of Bishop Ethelwulf, executed in the ninth century, was ornamented in niello. The Greeks of the Empire, too, must have practised it, and by them it was introduced into Russia as early as the twelfth century, for there exists in the celebrated collection of jewellery in Dresden, known as the Grüne Gewölbe, a drinking vessel in solid gold, which is supposed to have belonged to John Basilides, Grand Duke of Russia, having a Russian inscription executed in niello. About the same period, perhaps,

it found its way into Italy, where it soon partook of the general progress of the arts which was then taking place, and where in the fifteenth century it reached its highest development. Its chief seat was Florence, which produced three celebrated *niellatori*, Matteo Dei, Antonio del Pollajuolo and Mæso Finiguerra. The method of ornamenting in niello was to engrave with the chisel upon plates or vessels of gold, silver or gilded silver, whatever ornament, such as a history, a flower, a portrait or an inscription was required; the hollows thus formed were then filled up, not with an enamel glass, but with a compound of silver, copper, lead and sulphur. This compound when fused was of an intense black colour; hence the name *nigellum* of the ancients, which the Italians converted into *niello*. The effect thus produced was very elegant, though somewhat sombre. During the fifteenth century the sacred vessels used in the churches were profusely adorned in this style, especially the monstrances, chalices, &c.; and it was also applied to the covers of missals and other devotional books, reliquaries, the decoration of household furniture, such as ebony desks, escreteires, &c. (which were usually ornamented with silver plates, upon which were represented histories, flowers, &c., in niello), hilts of daggers and swords, drinking vessels, and indeed almost all silver articles. Niello-work appears also to have been used at one period as characteristic of mourning, as, for example, in the ornamentation of the sacred vessels used in services for the dead and during Lent. Widows who made vows of perpetual widowhood wore ornaments in niello, as we learn in the case of the celebrated Diana of Poitiers. In the sixteenth century the art was neglected in Italy, if we except the labours of Benvenuto Cellini, who was an ardent admirer of and executed a great number of works in it. After him the application of niello fell into complete disuse in all Western and Southern Europe, and was only revived about twenty-five years ago. This was not the case, however, in Russia, where it has been regularly practised, under the name of the "black art," since its first introduction into the country.

Fuseli's Imaginative Figures.

The importance of the constant observation of nature to the painter of real life will be readily admitted, but such habits are of no less value to the painter of the most imaginative class of subjects. The supernatural is not the unnatural. The centaur, the sphinx, the satyr, &c., are but combinations of nature, and there is true taste shown in making these ideal beings act naturally, as when, in a group of the Phygalian Marbles, a centaur bites his antagonist, and when Shakespeare makes Bottom the weaver long for hay and oats when the ass's head is on his shoulders. Indeed, two of the most exquisitely poetic conceptions of Shakespeare, the Oberon and Titania, when we look beyond the charm of their language, are the veriest man and wife that ever existed, and are the better for it. The ghosts and witches of Fuseli may be called natural, inasmuch as they are exactly what it is natural to the imagination to conceive of such things. It would indeed require the eloquence of Fuseli himself to do justice to some of his conceptions of the visionary; the ghost of Hamlet's father, for instance, or the weird sisters vanishing from the sight of Macbeth. Perhaps the finest of all the works of this extraordinary man is the "Sin and Death;" and in this he has done that which, had he not done it, we might have thought impossible—he has embodied Milton's words, "What seemed his head the likeness of a kingly crown had on." In the "Satan" of Sir Thomas Lawrence all is so material as to be wholly unnatural with reference to the subject. The body and limbs of the fiend are as solid as the shaft of the spear he holds; and the helmet, sword and shield seem painted from objects borrowed from the property-room of a theatre. In the "Sin and Death" of Fuseli there are a ponderous key (the key of the gates of hell) and a chain. But they are forged by no earthly smith, and are not otherwise thought of by the spectator than as parts of a terrible vision. Indeed few painters have given an equal degree of terror to such subjects; and in spite of occasional extravagance, not seldom indeed bordering on the ludicrous, Fuseli was a great genius, a genius of whom the age was not worthy. He was profoundly acquainted with all in nature that could help his conceptions of the visionary. He was a perfect master of chiaroscuro and of the evanescence of colour, neither of which are in any respect inventions of art. He had also acquired so competent a knowledge of the anatomical structure of the human figure as to be able to give ideal probability to attitudes in which it was impossible he could be helped by living models. Hence he could also give to his ghosts that general and uncertain look that belongs to shadowy beings, without the omission of the leading characteristics of form, and his breadth, to borrow an expression of his own, is never "emptiness." Fuseli, therefore, was as much indebted to the knowledge of nature for his power in the visionary as to his imagination; and it was in a great measure the want of such knowledge that rendered the art of Blake abortive.

NOTES AND COMMENTS.

It has been recommended by the Commission appointed to organise the annual fêtes at Orange that 1895 should be allowed to pass without the usual representations. The old Roman theatre requires reparations which cannot be delayed. The masonry of the steps or benches is becoming ruinous, and any use of them would involve additional expenses in restoration. It is also necessary to construct an immense *velum*. Ladies are not sufficiently enthusiastic to witness a spectacle in torrents of rain, and if they depart it will not be alone. The postponement of the theatrical performances may therefore be taken as certain. It is curious that one of the plays suggested for representation should be VICTOR HUGO'S "Cromwell"—a work which is never to be witnessed on any of the Paris stages.

WITH all its faults the Municipal Council of Paris is not neglectful of art. This year examples amounting to 74,600 francs—or, say, 3,000*l.*—have been purchased, that is, the Salon was patronised to the extent of 46,500 francs, and the younger exhibition in the Champs de Mars 28,100 francs. Out of the latter sum 17,800 francs were expended on four *objets d'art*, viz. a dining-room service, a "fontaine-lavabo," a decorative medallion and a plateau in bronze. Three paintings cost 8,000 francs, a water-colour 1,500 francs, and two sets of drawings 800 francs. At the Salon 22,500 francs were laid out on seven paintings varying in price from 1,500 francs to 8,000 francs, and 24,000 francs on five pieces of sculpture, the prices ranging from 3,500 francs to 8,000 francs. It may be said that 3,000*l.* is not a large sum to represent the official patronage of the capital of art, but it should be remembered that much money is being paid to artists for the decoration of the Hôtel de Ville, and moreover the Municipal Council is under an obligation to contribute largely this year towards the expenses of the International Exhibition of 1900. Many years, we fear, are likely to elapse before the Corporation of London or the County Council will be incited to expend 3,000*l.* on pictures in the summer exhibitions.

THE lantern of St. Nicholas Church (now used as the cathedral), Newcastle-on-Tyne, is so excellent an example of the coronal type of tower completion, its preservation has interest for all who care for English Gothic. It is now in so dangerous a condition the ringing of the bells is prohibited until the necessary works are executed. They will cost from 1,700*l.* to 1,800*l.* In most cases the cathedral authorities would undertake the restoration. In Newcastle, however, the Corporation will have to find the money. This does not arise from any local disestablishment Act, or from the right of possession, as is the case in Scottish towns. The only ground for liability apparent is that on some former occasions the Corporation, in a benevolent mood, paid for reparation, and when a financial precedent is once established it is not easily set aside. That the claim is not well established is evident when it is found that the Corporation is without any representation in the cathedral body. The only consolation for the ratepayers is that the lantern is an ornament to their city such as few towns possess, and that its destruction would be a calamity.

AN arbitrator cannot be too circumspect in referring to a case with which he has to deal. Sir ALEXANDER RENDEL, the engineer whose name is associated with so many large engineering works in India and elsewhere, was appointed arbitrator in an action brought by a firm of contractors against the Leith Dock Commissions. He happened to say at a dinner party as far back as February 1894 that the contractors ought to have a larger sum than 2,500*l.* which was offered by the commissioners. His words were reported to the latter, and when Sir ALEXANDER RENDEL gave his award an effort was made to set it aside. It was alleged that Sir ALEXANDER RENDEL was not an impartial judge, having previously expressed an opinion favourable to the contractors in circumstances which rendered it impossible for him to give thereafter an impartial award, and that the fact of his expression of an opinion unfavourable to them was concealed from the Commissioners. Lord Low, the judge who heard the case, said it appeared to him that the opinion expressed by the arbitrator, under the circumstances in which it was expressed, had no tendency to bias

his judgment or to make it difficult for him to say that nothing should be paid to the contractors, if that should be his opinion after hearing evidence. His lordship was of opinion there was no concealment, and accordingly judgment was given for the contractors.

AN index is more indispensable in an encyclopædia than in any other literary work, unless the alphabetical arrangement is carried out to an extent that becomes embarrassing and repetitions are adopted without limit. When, as in the case of the excellent "Encyclopédie de l'Architecture et de la Construction," edited by M. PLANAT, the majority of the articles are complete treatises which could be brought out as independent volumes, the need of an index becomes still more evident. The "Tables du Texte et des Dessins," just issued by the publishers, MM. AULANIER & CIE., will be a boon to all students of the six massive volumes of the Encyclopédie. No description could so well suggest the variety of information which M. PLANAT succeeded in amassing in his Encyclopédie as a glance through the pages of the index. It will enable readers to make an exhaustive study of architectural subjects. Let us suppose English architecture is taken up. In the first volume is a general study; the Roman, Gothic, Renaissance and Modern periods are elsewhere specially treated. Examples of buildings, not only in London, but in provincial towns and villages, are described and illustrated, and can be referred to without delay. As every class of modern building is described, such as banks, residences, theatres, circuses, baths, schools, warehouses, clubs, churches, a clue is afforded to practice in many countries which will often afford to the architect suggestions which he seeks. Take the case of libraries. We find illustrations and descriptions of examples in Berlin, Munich, Stuttgart, Wolfenbuttel, Birmingham, London, Vienna, Boston, Washington, Reims, Bordeaux, Grenoble, Paris, Toulon, Siena, Leyden, Coimbra. It would be strange if among so many there were none which could afford hints for new libraries. Details are likewise discussed separately, and a reader can judge of ancient and modern practice, of local varieties as well as generally approved forms. The index is arranged in a manner which facilitates reference, and it will increase the value of a work in which the architecture of all times and countries is presented by competent authorities.

THE *Standard's* Athens correspondent telegraphs that the Archaeological Society of the Greek capital have decided shortly to take in hand the repairs required to prevent the Parthenon from falling into a more dangerous and ruinous condition than it is in at present. The repairs are to be carried out on the lines suggested by Professor DURM, who, after a careful and minute inspection of the structure, drew up a report on the subject. A commission of architects has been appointed to superintend the work of reparation. Mr. F. C. PENROSE, Professor DURM, and the French archaeologist, M. MAGNE, have been requested to give their views and advice on the details of the proposed repairs.

THE Guide to "the Monastic Church of Lestingham," by Mr. CHARLES WALL (C. TAYLOR) is a model of a guide book on account of its handiness, clearness and accuracy. The Church of the North Riding village was founded in the seventh century, and the choice of site was enough to indicate that St. CEDD, the brother of the more famous St. CHAD, was a model monk in his love of the picturesque. Apparently no part of the existing church is older than the eleventh century. In the early part of the century many alterations were made under the direction of JOHN JACKSON, R.A., the portraitist, who was a native of Lestingham. He painted a copy of CORREGGIO'S *Agony in the Garden*, which he presented to the church, and had the chancel altered for its better exhibition. Mr. WALL says:—"This was a most lamentable instance of dishonouring God for the glorification of an individual; the gift was quite worthy of a place in God's house, but to enhance the beauty of the picture the whole idea of a church for sacramental worship was ignored, and to elevate the art of painting the sister art of architecture was debased." The authorities who granted the faculty were no less to be blamed. The old church is most interesting, but it is little known, and Mr. WALL'S guide-book may induce many tourists to visit it.

THE DECORATION OF ST. PAUL'S.*

WHEN I was asked to read a paper before the Society of Arts upon mosaic, my first inclination was to decline to do so, because, like all other arts, the art of mosaic is involved with technicalities which, to a mixed audience, can claim but very limited interest. Upon second thoughts, however, it occurred to me that it would be wise to set aside all doubts as to the interest or the reverse of the subject of my discourse, and to remember only the object of it—a noble one at least—the decoration of our great metropolitan church of St. Paul.

It will be needless for me to enter into an historical treatise upon mosaic, though I shall have to say something about its growth and decline, because books provide such information, and, moreover, the historical side of the question was very fully set before us not long ago from this desk.

It is left, then, for me, with as little egotism as possible, to set before you the history of my experience, which has by this time become very considerable in a difficult and beautiful art, which the longer I study the more enchanting I find its possibilities and the more ennobling its limitations and restrictions.

It will be impossible to avoid technicalities, which will only commend themselves to experts; they are of necessity dull matter, excepting to those who are more or less craftsmen.

It must be remembered that an artist speaks to you primarily and almost entirely through his special language of form and colour; his pen may be a useful adjunct, but it will never instil a comprehension of the language of æsthetics unless the artistic sense is already present in the minds of his audience. Colour and form can no more be described in words than notes of music. If eloquence and a mastery of language could have succeeded in making English people an artistic nation, the writings of John Ruskin would have done so years ago. We are in this latter half of the nineteenth century in a desperate hurry; life is so complicated, so full, so strenuous, and leisure is so rare, that the arts of peace, which demand quiet and study, have but a slender chance of assuming that importance in our lives which they undoubtedly assumed in simpler and less distracted civilisations. We are to a certain extent the slaves of fashion, ever shifting, every changing with a rapidity truly appalling, by which restlessness art must suffer more or less, and especially that form of it which is known by the title "monumental."

Monumental art claims no fashion; it is not the result of a moment's exhilaration, it is not the mark of a clique, nor is it the common property of the sale-room; it is essentially non-commercial. To induce a taste for monumental art in England, excepting in a very spasmodic fashion, has always proved to be difficult, indeed it would appear to be wellnigh impossible. It was difficult a century ago, when James Barry painted these walls whilst he lived mainly upon bread and apples, and Sir Joshua Reynolds was filling the learned with amazement by his profound discourses upon "the grand style" and his eloquent eulogiums upon that greatest of all modern artists, Michael Angelo. The art of Fuseli, Barry, Haydon and other enthusiasts left but little mark upon the buildings of England. Tom Thumb, the famous dwarf, attracted crowds, while the collection of pictures by Haydon was visited by ones and twos. The particular constitution of the English mind is practical; its predilections are more Roman than Greek; it is more sensible than poetical, more commercial than imaginative.

The Reformation set a-blaste whole piles of prejudices: the dread of idolatry, the fear lest matter should be worshipped in place of spirit, strangled every artistic effort in the direction of church decoration. Such violent feelings were national, so that when the Bishop of London was approached in regard to the decoration of St. Paul's a century ago, he not only spoke his own feelings, but probably he expressed also the feelings of the majority when he made answer to a deputation, "that nothing would induce him to sanction the conversion of Protestant St. Paul's into a Popish church."

So the "grand style" of Reynolds, Barry, Fuseli and other considerable artists never came off. Hence our cathedral remained an example of the dulness of Protestantism, an evidence that England was not ready to remarry religion and

art, which since the sixteenth century had been divorced, to the serious detriment of one as of the other.

Time has, however, wrought change in the aspect with which such matters are regarded. The Oxford movement, greater facilities of travel, and a generally broader and healthier view of religion, and its consequent emancipation from many narrow crudities, have one and all conduced towards a possibility of that reunion of religion and art which cannot fail to promote vitality and reality to both causes.

So when the atmosphere of thought was cleared of prejudice and narrowness, it got into the air that St. Paul's Cathedral could not be allowed any longer to remain a standing protest against progress, whilst even the Nonconformists were finding that they must travel a bit with the times, and shed some of the dull feathers of their mournful plumage, and break into song accompanied even by that dreadful instrument, the "devil's box of whistles." And so it came to be again seriously considered that St. Paul's should be decorated in an appropriate manner in accordance with the wish of Sir Christopher Wren, and this time there was no veto put upon the enterprise by a narrow-minded prelate.

Once more that precious votive offering of man's highest intelligence, and his power to create and to dedicate his gifts to God's house, were to be offered in an Anglican cathedral, and which had been for three centuries almost wholly absorbed by that branch of the Christian church belonging to Rome.

That great artist, Alfred Stevens, whose monument to Wellington is worthy of the great general, as it is worthy of this nation, made designs for some of those spaces known as the spandrels below the great dome of St. Paul's.

Another great artist, happily still with us in the possession of his great faculties at an advanced age, George Frederick Watts, designed for two of the spandrels. We now see the result in mosaics executed by Dr. Salviati, of Venice.

Various experiments were tried for the decoration of the choir and the great dome, which, for one reason or another, failed to receive a cordial recognition, notwithstanding the marked ability of Sir Frederic Leighton's and Mr. Poynter's designs, and for a time matters came to a standstill.

The reredos, erected from Messrs. Bodley & Garner's design, demonstrated the absolute necessity for proceeding with the decoration; and it was through Mr. Bodley's advice that I had the honour of being called in to render my assistance. And let me here take this opportunity to express my gratitude to my friend, Mr. Bodley, for his having been the first cause which brought to me a labour that has been, is, and will be, I trust, for some years to come, fraught with the highest pleasure and deepest satisfaction, which entirely outweigh the anxieties and responsibilities of my work. And this is a fitting time and opportunity for me to record my everlasting obligation to the distinguished Dean who has so kindly taken the chair this evening, and to his colleagues for their touchingly loyal confidence granted to me by one and all of them.

In an undertaking so difficult and so full of possible pitfalls I must here affirm that it would have been impossible for me to have carried out my work as far as I have done with a comparative sense of ease had not I felt at every turn, and under every difficulty, that I was envired by an atmosphere of sympathy and perfect confidence, which increased my energy and desire to worthily carry out the wishes of my friends. I question if in the whole history of art any man has been so happily circumstanced as I have been, or ever worked under conditions more favourable to himself.

One more pleasant recognition before I start upon the egotistic track. My thanks are due to Mr. Harry Powell for his unremitting labour to give me what I wanted in the glass tesserae, as well as in the glass for such windows as I have designed and executed for St. Paul's.

I venture to think that in all respects the materials supplied by Messrs. Powell for my work are first-rate—equal, indeed, to any which were supplied to the mosaic artists of the best periods, Greek or Italian.

To my workmen, whom I regard as brother artists, both those who assist me in my studio as well as those who work so carefully and so steadily in the cathedral, I tender my heartfelt thanks. Instead of increasing my difficulties, one and all of my co-workers have aided me unselfishly and kindly.

When the Dean and Chapter desired me to submit designs for the decoration of the choir, I was fully determined upon certain points. That the only material for such decoration was mosaic, because it can be washed without injury, an absolutely necessary precaution under the condition of London smoke-laden atmosphere. However delightful may be the methods of fresco and tempera painting in the clear air of Italy, or even in country places in England, while London air continues to be charged with every destructive acid, they are out of the question there. And, further, the advantage of mosaic over all other material for decoration lies in the free use of gold and silver which is demanded by the nature of the design that is applicable to the material.

Against pictorial mosaic I resolved to set my face, and to

* A paper read by Mr. W. B. Richmond, A.R.A., before the Applied Art Section of the Society of Arts on May 28.

adhere to the principles of design and execution which prevailed in Italy, Greece and Asia Minor during the classical times of the Byzantine Empire. And while adhering in principle to severe methods of design and simplicity of colouring, to accept and make use of the modern spirit of antiquarian research I determined to follow the precepts of the great masters, by being accurate in drawing and, according to my lights, noble in my choice of form.

But perhaps my most important point, as it appeared to me to be, was that our Metropolitan Church must be decorated by English and not by Italian labour. I am bound to say that if England found herself unable to provide genius and talent for the adornment of her great church, better that it were left alone, to prove once more that we are not an artistic people, but only a race of shopkeepers.

As far as my workmen are concerned, the aphorism of Napoleon has been contradicted. Quite leaving out any estimate of the qualities of my design from the question, of which I am no judge, in fairness it can be said that the mosaic work in St. Paul's, laid by English workmen, the materials for it made in England, proves that, however rash it might have appeared to be at first sight to employ them, there need be nothing but congratulation as regards the choice.

The workmen under me have proved themselves able to compete with and beat their co-workers upon the continent, a matter of the utmost importance at a time fraught with commercial difficulties and stagnation in the labour market.

Another point upon which some determination upon my part had to be exercised. Whether from false ideas of economy or, what is more likely, a certain listlessness, modern mosaic workers have thrown aside the well-tried principles of mosaic manipulation, substituting a method illegitimate, lifeless and unreal. I allude to the practice of fixing the cubes by means of gum upon canvas away in a workshop, far removed from the building that is to receive them.

That process I will not waste my time in describing. Yet, broadly speaking, one aphorism that applies to all decorative art may be permitted me. "Just as a building is erected where it is to stand, so every portion of the decoration of that building, wherever it has relationship to the walls or to the structure, should be executed where it is to remain, in the light and under the conditions of its environment."

If one lesson can be learned which is absolutely sustained throughout the churches of Italy, it is the important fact that an harmonious spirit seems to pervade these churches of every century's labour, even to the seventeenth century; because what we see there, from Lombardy to Naples, are conceptions, conceived as a whole, executed as a whole, and perhaps carried out unconsciously harmoniously with their surroundings; because they were carried out *in situ*, under the ruling of the dominating influence of architecture.

This being duly considered, I had to look around. It was not unnatural that my first thoughts should travel in the direction of Whitefriars Glass Works, where the Powells have been labouring to improve the manufacture of ornamental glass for more than a century. And I was rewarded.

Mr. Harry Powell, as I have said, took infinite pains to supply me with tesserae as good in colour as any I have seen; indeed, upon placing them side by side with cubes of Greek and Italian manufacture of the best period of the mosaic art, I am bound to say that they were hardly distinguishable one from the other, either in quality of material or in brilliancy of colour.

To start with, I thought a palette of thirty colours, or rather shades of colour, was sufficient, and there I was right; that number is much more than sufficient. As my experience increases eight or ten tones of colour are ample if used with art and knowledge as to their relative action. And this limitation of the number of colours is one of the great powers of mosaic, which I will later on briefly explain.

Well, if we were to recede from modern technique and re-adopt the old style, how were we to proceed? You know that there are two cements, water and mastic, in which the cubes are inserted. It is beside our intention this evening to follow to earth every detail of my great enterprise; suffice it to say that, after many experiments, I found a mastic cement answering in every detail to a cement employed in the fourteenth century in the restoration of Andrea Tafi's mosaics upon the dome of the baptistry at Florence. Its advantages are many; it does not dry too rapidly, and it retains a certain modicum of elasticity for a long period.

Those members of the public who have so generously opened their purses for the decoration of their cathedral need not fear that time will prove cruel towards the object of their donations. My cement in time becomes so hard, and the cubes are so firmly embedded with it, that it may in time be said to be like stone. Thus one very grave difficulty was with patience surmounted.

Now came the testing-point of my rash promise to obtain English workmen. Again I applied to Mr. Powell. Two of his young men had already executed a mosaic panel, after a design of Mr. Holman Hunt's. But as their work had been entirely

the modern picture mosaic, executed with thin plates of glass in place of cubes, the method which I had determined to employ was to them an entirely new one.

Now, at the outset of my work—seeing that I was to initiate the recovery of a lost art—much as I desired at once to work upon the wall of the church, upon consideration it appeared to me important that the initiative should be made as easy and convenient as possible, seeing what the difficulties of the problems before us must of necessity be. Therefore I built in my garden a shed and a studio, the one for my use, the other for the use of the mosaic workers, who, as time went on, gathered strength in numbers recruited from various sources, till we finally for the moment reached nine workers, and here we worked for four months.

If we were not yet to work upon the wall, what were to do? I had large slabs of slate cut, well scored with diamond shapes, so that the intonaco to be laid upon them would find a grip; and upon these slabs were executed the first two spandrel mosaics, those which you can see upon the north side of the sanctuary above the arch between the cornice and the capitals. But I must go back a moment. The sketches prepared upon a small scale, the full-sized cartoons, were executed. I chose to make my first essays upon the parts of the church lying midway between the vault and the floor, so that they might offer me a fair chance of trying the strengths of light and dark at a comparatively speaking moderate altitude. Thus, I should have a guide for future work by which I could reason what strength would be required at a greater height. These cartoons I made in charcoal for the following reasons:—I wished not to compromise myself with elaborate colouring at the outset, for I feared that my practice as a painter might lead me, however carefully I guarded against it, to disregard the peculiar nature of the material I had to use; also it would enforce my being present during the whole proceedings, and oblige me to overlook every bit of work, and in point of fact to do a great deal of it with my own hands; this I did, not only executing a considerable portion, but also learning how to cut up the material so that I might prove to my own satisfaction what could and could not be done in shaping the cubes. I believe in only four shapes as the result of this experience, namely, the cube, the double cube, the equilateral triangle, and elongated cut forms finishing in sharp points. In order to be exact in the shape of the slabs which had ultimately to be fitted together and to make a perfect joint when fixed, I cut my cartoons up into the necessary number of shapes of such a size that each shape could be given to one or two men to work upon.

I made a rule to begin with the outlines, whether in the flesh or the drapery, of working from the shadow, through the half-tint, and so up to the light. A difficulty sometimes occurred in that, as the space became filled up, the cement overlapped and pushed the outlines out of shape; this difficulty was easily met by pressure from the outside of the outlines until they assumed their proper curves. It was no small difficulty at first to persuade my workmen to leave a good margin of cement showing between one cube and another, naturally, for the three of my workmen who had had some experience in paper mosaic, two having worked with Messrs. Powell and one with Salviati, had acquired that evil habit of jamming the cubes closely side by side, thereby quite ruining the legitimate effects of signs of building, so important to mosaic as to architecture, and making, instead of structural design, an indifferent imitation of a picture. I endeavoured to beat into their brains the fact that the worst mosaic is most like a picture, and the best mosaic has all the structural qualities belonging to architecture—the one entirely out of place in a building, while the other seems to grow naturally out of architectural forms. After a time I found my men taking a keen interest in the work—intelligently—proving, after all, that Englishmen only need to have sound principles taught them, and insisted upon, to render them as serviceable craftsmen as the world can now produce. Upon more than one occasion they have said to me that they no longer felt mosaic work to be monotonous, mechanical and uninteresting; whereas under the system of cutting the thin slabs of the flash mosaic of Messrs. Powell's into complicated shapes—more complicated than geographical puzzles which we used to put together as children—they wearied of it. I made it a rule never to leave my men in doubt as to my meaning. When I criticised, no work was taken out to be re-done without careful explanation why it was done. I drew diagrams to show what I meant as to the simple principles of building the cubes, worked with them, raised the enthusiasm of those who were to be my prime helpers in a most difficult and responsible work.

For more than three—nearer four—months day by day we worked together. At the end of that time I am bound to say that I was much wiser than at the beginning, and I venture to think that all the anger which had exploded and the labour expended during that period were not in vain. I had got my staff into good working trim, as I believe anybody could do, if they would never trust to a middle man, that most fatal invention of modern commerce and successful destroyer of enthu-

siasm, and consequently of life in work and everything that makes art in immediate touch with our most delicate sympathies. Until that incubus is got rid of, and architects as well as decorators limit themselves mercifully to what they can personally oversee, delegating nothing to a subordinate, and are day by day in immediate relation to their craftsmen, there is nothing to expect for the future but death and sterility for art. At last the two spandrels were completed and carted away to be put up in their place. The wall to receive them was cut back, and the slabs were fixed with bronze screws into leaden sockets inserted into the stone, being bound to the wall with red lead.

And now, with regard to these two spandrels, permit me to be at once frank and brief. I did not use sufficient strength in my outlines—I used my white too liberally—the consequence being that the half-tones are too narrow, on account of the liberal expansion of white. I erred upon the side of light, and neglected broad shades. I hope, however, to have this put right by-and-by, and I feel sure that the same faults have not again been committed. In the meantime, my men being in full working trim, I resolved to attack the small easternmost dome. This dome, saucer-shaped, happily obliged us to begin to work upon the wall at once, and I thought it a good opportunity to put my men into a position of responsibility, as they had just come out of a severe and personal training.

It was not without some difficulty that I persuaded Messrs. Powell, who had never executed anything in mosaic directly upon a wall, that the principle of paper mosaic was not the best and the cheapest: they imagined that their system was quicker, and therefore more profitable. I, on the contrary, held the opinion that upon the economical question they were wrong, and that I was right; but in order to prove my point I had an eagle worked upon their principle. They were convinced, not only upon the important point of economy, but, secondarily, upon the result. My principle took about half the time, and was infinitely more satisfactory when done; indeed, the man who, after having worked with me, lamented that he should have been employed again to go through the deadening drudgery of the modern system.

It is wonderful how quickly the modern mind is accessible to art when it has once grasped the fact of its relation to profit, but you must indelibly prove the profit before the artistic sense is touched. Whatever may be the results of my work, *qua* design, that I have nothing to do with. I am willing to wait a century for an estimation of its value; but one thing I trust to have done, I trust I have, for ever killed paper mosaic in England, for financial as well as artistic reasons. I hope to have re-established the old plan, which is quicker, cheaper and better than the new; it leads to finer work; it is more certain in its results; it is legitimate in principle, and first and foremost it is infinitely more amusing to the workman, for it stands to reason, if the workman is not amused by his work, it will be lifeless, inarticulate and dead. Drudgery we all have to pass through, but the drudgery that is slavish and leaves nothing for spontaneous expression, and which makes the workman into a shackled slave, can be no more humanising to him than it can be interesting or touching to the minds of those who review its results.

I have been very careful to retain work which, while it did not come up to my standard of completeness, displayed at the same time a vitality and character which I should have been very sorry to lose. Uniformity of execution of such great magnitude would end in dullness without variety of execution, and the faults of its merits that help to give it life.

No better illustration can I think of than the frieze of the Parthenon, evidently the work of one designer, though executed by several different hands. One recognises the failure of expression here and there among the triumphs of perfect successes—the halting incompleteness by the side of gem-like finish. We feel the pulse of the workman in the touch of failure, and the work is human; the shadow, as well as the light of the human mind, is there: our sympathies are aroused for the duplex nature of man. A dead level of perfection, a cold accuracy of science, and a perfection to be reached only in such a small thing as a Greek gem, would be quite insufferable when exhibited upon an enormous scale, which naturally demands the exhibition of many and very various phases of thought.

For four months we worked upon the dome. Before commencing the mosaic I offered up my charcoal design. Afterwards I coloured it, and again offered up a portion of the coloured cartoon. The first was with the object of ascertaining the strength of outline, the second the strength of colour. As I see my work now completed in mosaics I see reasons for certain regrets. My cartoons having been executed in pastel did not receive any reflection upon their surfaces from the nature of the material adopted. The mosaic, however, does receive reflection. The lesson I learnt here was to make my outlines and masses far more distinct in the cartoon than I intend them to appear when transposed to another and reflecting medium, because the reflecting surface eats into all the dark

surfaces. I also made too many details; in point of fact, in a sense, I put in more work than was really needed. Upon the other hand, one must remember (to compare great things with small) that Phidias completed every figure upon the pediment of the Parthenon *ad unguem*. Some of the most delicious portions of the work were for ever hidden from view from the time they left the workshop of Phidias to the time when they were taken down by Lord Elgin. This, to the commercial mind, is labour thrown away, but to the dedicatory spirit of the great Greek artist, his labours meant religious offering to the virgin goddess; his sacrifice through his art was to her, he gave her his best, his truest and noblest self, disregarding the labour he expended he disregarded applause or blame. Sentiment apart, it is my firm conviction that the influence of delicate details, even upon a height, is never wholly lost, it gives a play of colour, a mystery, and an interest which breadth alone cannot achieve; it is possible to overdo detail, but it is far worse to underdo it. To overdo breadth, ends in baldness, a far greater sin, to my thinking, than an excess in the other direction.

Every portion of a building requires a different treatment, owing, of course, to the manifold effects of light to which surfaces are subjected. In the case of the dome it was desirable to heighten it in effect, rather than to lower it. A dome we can hardly call it, in that its elevation, at the apex of the curve, is not more than 3 feet, so that in point of fact it is more like an inverted saucer than a cup.

As soon as the plaster was stripped and revealed the extremely beautiful brick face—better brick building I have never seen—I at once became aware of the heightened appearance which the concentric circles of the white mortar lines between the courses of bricks gave. Oddly enough I had already designed for the dome upon such principles of concentrating circles—to my mind a far finer treatment of a domical surface than by breaking it up in ribs. Fearing that I might miss my intention to add rather than to diminish height, the outline of my forms I kept thin, not more than a quarter or an eighth in width, and I made use of brown instead of black. Upon all the interior forms of birds and trees, I permitted myself neither brown nor black, and kept all the drawing of the wings, feathers, &c., very bright in colour, making use of red, amber, green, blue, grey, both warm and cool, and the high lights of white or a pale lemon yellow. In many instances, notably in the birds which I wanted to appear whitish, I outlined the more delicate parts of their plumage with silver, so that those outlines, when the silver was not shining, might appear to be dark and light off the white when the silver shone. In the leaves of all the trees I drew the veins with silver, and touched the edges of the leaves with gold. The gold background of the whole design is made of burnt gold and the tesserae are laid in circles, concentrating at the apex and widening as they descend and curve. But white I found to spread excessively, dark blue to tell as black, amber colour to become quite unreasonably dark, pale cool pinks even greyed very much at a distance, and required to be outlined with a strong red to give their value. Both warm and cool greys can be altered as to their appearance very markedly by the colour of the outline by which they are surrounded; outlined with blue, the whole mass by which the outline is surrounded appears to be influenced in a very distinct manner by its environment; so also does the same method hold good when the outline is red. Blue round white intensifies the blue as light, whereas outlined with red, the white appears pink. Strong yellow greens tell extremely well, but they must be outlined with a thick line of red or burnt sienna brown to give them their proper value. White lines in light green are very disastrous except at rare intervals; either a toned grey or a dull yellow breaks the green best. A black outline to blue is only necessary to divide the blue from gold, or to draw the folds of drapery where the lights of the blue are heightened with gold; the black outlining seems to preserve the integrity of the blue, whereas a red outline turns the blue into purple. A dark outline of blue on green gives a very mysterious effect, but, in that case, the blue must be a very clear one, and of a middle tint quality, otherwise the blue will tend to make the green appear muddy.

I have said that I made use of a good deal of silver, notably in the two spandrels and in the dome; I should not use so much silver upon another occasion: it has a great tendency to grey its surroundings. It looks very dark when not illumined. Upon the other hand, when flashing, silver has a greater power of light and of expansion than gold. A line of silver the sixteenth of an inch in width will eat through the lines of black almost as light eats into the lead lines of a window. The appearance of silver is easily attained without disadvantage by drawing a thin line of white and outlining it upon either side with a still thinner line of gold. The experiences in working out the dome were most interesting and instructive; the faults I committed were chiefly due to weak outlines, especially upon those parts of the design which have a golden background. The tesserae which I employed were, on the whole, too small, and from this fact there arose an excess of detail, because I

could use a greater number of small tesserae, and so put in more detail in a given space than I should have been able to accomplish with larger cubes.

The gold background to the design I think I may claim as a success. There is no burnished gold used whatever, the more cracked portions of the burnt cake were invariably chosen, lit here and there with brighter portions cut from same cake; and the gold was mixed, that is to say, red, green and blue gold were laid side by side. One reason for the brassy and unpleasant appearance of modern golden backgrounds is due to two causes: the first where the tesserae have been laid too flatly and too closely together; secondly, only one quality of gold, instead of many, has been adopted. Probably, of the two, the more disagreeable effect is obtained by the too close proximity of the tesserae, but also by the colour of the intonaco upon which they are laid. One need never be afraid of letting the ground show the 1-16th or even a $\frac{1}{4}$ of an inch in width round each cube. I would even go so far, under certain circumstances of light, to expand even that width. One is far more likely to err upon the thin than the thick joint. Gold set into a white ground never looks so well as when it is set into a red one, the white outline having a tendency to grey the gold excessively; in point of fact, to silver it, it is better to add white curves among the gold, wherever it is desirable to grey the gold.

I have noticed in old mosaics, notably those at the baptistry at Florence, that the ancients recognised the disagreeable appearance of the white line, for they have taken pains to colour the white division with red. It used to seem to me that the Greek mosaicists employed at St. Mark's, Venice, purposely put spots of black, green, or red among their gold, but I have been obliged to give up that idea upon more minute investigation, and to account for the presence of those black, green, and red spots from the fact that the upper layer of protecting glass has corroded where it has been thinly applied, the gold leaf going with it. Thus the colour of the ground upon which it has been laid has been revealed. These dark spots, doubtless, have a pleasant effect, but I think greater advantage is to be obtained by mixing with the brighter tesserae those which have been exposed to heat, and whose dappled surfaces reveal in thin lines all over the surface the colour of their grounds, and so they imbibe both the colour and the brilliancy of the metal. Burnished gold must only be used very moderately; it makes a garish effect, except in very thin lines.

In modern Italian restoration of ancient mosaic, bright burnished gold has been set up in the place of dull and broken gold; hence, the old work has been rendered vulgar and garish that was only rich and solemn. The mosaic in the apse of St. Ambrogio, at Milan, has been almost spoiled by coarse restoration in the time of my memory. Red disappears when white gold is used to heighten it in thick lines; it is blackened in the shadow and destroyed in the light, for while the gold shines excessively in full light, and consequently acts through the edges of every neighbouring colour, so in shadow does it become relatively dark, and an extremely powerful deflector of darks; whereas the modified or cracked gold does not shine so brightly, nor does it reflect and refract dark to the same extent when in shadow. You will probably remember how thin the spiked gold lines are which lighten the draperies of most of the earlier mosaics; how, when the gold flashes, they only seem to illumine the colour with which they are mixed, and when they are in shade only give splendour to that local colour. That is the right way to use gold. The black pigment made use of by the old mosaicists, Greek and Italian, as far as I have been able to ascertain, upon close inspection, was of a kind of cinder colour, or the grey black of coke, quite dull and unglossy in surface, and excessively corroded by the heat of the kiln. They had not a good strong black, so as a rule they adopted dark brown as an outline that told darker than the indifferent black at their command. It must be admitted that the brilliant light of the Italian skies does not oblige the outlines of forms to be so manifestly insisted upon as in our dark climate; there dark tells with much greater force than here; where, in Italy, a thin outline of brown would be quite sufficient to detach one colour from another, and to mark the form here to achieve the same result, double the thickness of outline and double its depth in colour is necessary to achieve the same result.

Messrs. Powell have supplied me with a splendid black, quite invaluable; in shadow it tells really black and becomes a deep and pleasant grey when the light falls directly upon it; in reflected light it assumes a sufficiently neutral dark to serve all purposes of a strong outline, so when the work is in full light the black outlines do not cut too sharply; a very unpleasant effect it is when they do, and in the shade they tell out with full force of tone and accentuate the colour portions which are for the time being in shadow.

I take it that we all learn more by our own mistakes than by what success we may now and then attain, and I apprehend that you, my audience, will gather more good from a detailed account of the growth of my work and of its shortcomings than

by a catalogue of my winnings. Not unnaturally one was led into certain mistakes to start with, and these mistakes have gradually taught one right principles—principles not founded upon theory, but upon practice and experience.

To revert to the progress of the work, after the completion of the small dome, as winter was coming on and the scaffolding was not completed, I decided to try two more panels upon slate; these two panels were executed in the workshop at Whitefriars. When these were put in place, I saw the utter futility, once and for all, of such a practice. My cartoons had been made previously, and set in place they looked strong and light, because of the non-lustrous quality of their surfaces. The mosaics, when seen bit by bit, side by side with the cartoons in the workshop, looked right, and unmistakably they are wonderful facsimiles of my drawings, but the moment I saw them placed among their surroundings—deep undercutting of mouldings and darkness—it was quite evident that they must be gone over and considerably strengthened, not so much in regard to their local colour as in emphasis of white and black. My dark outlines were thin, and my white lines too much toned, and we set at once to work to correct these defects, inserting outlines of half an inch in width, with the new black among the dark colours; and among the light colours we inserted very pure white drawing lines, or separating lines, especially where a blue and a red of the same tone were in juxtaposition. We also withdrew a great deal of bright gold and inserted dull. The effect was magical and fully rewarded the labour it obliged—for a labour indeed it was—and you will understand it when I tell you that so hard had the intonaco become that a mallet and chisel had to be made use of to remove each single tessera which had been laid into the wet intonaco, now, after the lapse of time of a little over a month, become as hard as flint.

I made up my mind, once and for all, that during winter as well as summer we would work *in situ* and not any more fumble away at such child's play as executing a decorative work away from its conditions of environment, a practice I believe to be quite fatal to successful decoration, and involving considerable loss of time and expenditure of energy, because, if the artist is conscientious, he is quite certain to feel himself bound, practically speaking, to re-execute the greater portion of his work, so that it may take its relative place among the objects, of which it should be one, and to which it must bear relation. The practice of painting the decoration in the studio and clapping it upon a wall, differently lighted and differently influenced by the character of architectural mouldings and surroundings is a mistake. I defy any artist, even of the greatest experience in decoration, to calculate his effects so minutely in a well-lighted studio so that his work shall appear in its proper relation to the objects which should be at once a part of it when placed in an entirely different lighting, and all the conditions of its environment are totally changed; nor do I think that anything but the roughest sketch for colour is desirable for the cartoon. Although every boundary line between shadow and shade, shade and light, should be very clearly defined, because the transposing from one material to another involves changes that can only be made under the eye of the artist himself. It is true that he can calculate roughly for the modifications a necessary part of transposition, but the more delicate modifications, which are the life and soul of success, he can only make when actually working in the material that is ultimately to produce his design; and for this reason it is necessary that the artist should be constantly upon the spot, watching the translation of his design from one material into another, whenever he cannot himself execute it. If he is not inclined to do this his work is sure to suffer, for, however clever the workmen may be, not one of them knows really what is the effect the artist has in his mind and which he desires clearly to render. We know by experience how, in a small way, pictures painted in a well-lighted studio totally change in appearance even when exhibited in a well-lighted gallery from what they were in the studio. And if this be true of an isolated picture, that it receives such a curious impression from its surroundings as to be scarcely recognisable as the same work under different conditions, how much more must the same law apply to a large scheme of decoration.

In the work which has been recently uncovered I believe that most of the faults which I have confessed to exist in my previous efforts have been overcome. At the same time we are all learning: every day of experience brings new light upon our beautiful art; and while one can never expect to attain perfection, I have no doubt that every fresh adventure will be more successful than the last. The confidence of the public as well as the kind manner with which our labours have been received by the Press, stimulate us to fresh exertions for the public's instruction and delight.

So have we gone on from space to space, learning and, I hope, improving, until now more than two-thirds of the choir are complete; and if all goes well I shall have the honour next Easter year to show to the English public a complete scheme of decoration, carried out and fulfilled by English workmen

upon a scale second to none in Europe. A new art acquired, a new craft learned and its difficulties conquered.

And now a word from the ethical point of view.

In a moment of decadence in literature and in certain forms of art, we are told that art for art's sake is alone to be permitted. Surely that is a very dangerous axiom. In the best times of art, whether in early or recent pagan times, or early or recent Christian times, religion has been glad to accept the services of art to give substance and reality to her mysteries.

The morality of art, the impulses which draw her to choose the noblest events in the history of the world as texts wherein to lay her gold and silver, her colour and her jewels, are aided and strengthened by that consecutive stream of sacred thought upon immortal themes that have exercised man's intellect and feeling even from the prehistoric ages until now.

It is not for us to lay aside such restraints upon our fancies, and such purifying motives which are induced, by illustrating upon the walls of our churches for the use and service of all, in a moment when materialism of many gross kinds is poisoning literature, art and the drama.

Let us have the best art in our churches that can be obtained, and let the walls of the houses of God be the sacred picture galleries, free for our people, where they can learn nothing but good, by seeing beauty and purity attired; where they can read the old stories of the childhood of the world; where they can be refreshed, mind and body, by the study of the beautiful; that beautiful, which, to be perfect, must unite the material and the spiritual.

THE PRESTON ARCADED BLOCK.

TWENTY sets of drawings were sent in for the new commercial premises which Mr. N. Miller is about to erect on a site containing 2,500 square yards, bounded by Church Street, Lancaster Road, Birley Street and Jacson Street, Preston. The block will consist of fireproof shops, two licensed houses, an auction room, &c., and will cost about 50,000*l*. Mr. E. Salomons was appointed assessor.

The first premium of 150*l*. has been awarded to Messrs. Essex, Nicol & Goodman, of Birmingham and London; the second of 100*l*. to Mr. E. W. Johnson, of Southport; and the third of 50*l*. to Mr. G. G. Hoskins, of Darlington.

The following is the description which accompanied the successful design, which is of a Spanish Renaissance type:—In settling the width of the arcades we have made the one from Church Street to Jacson Street the narrower, owing to the extreme value of the frontage to the former street, and by the fact that this arcade takes from the width of the shops and not the depth, which is the case with the wider arcade from Birley Street to Lancaster Road. Fortunately the shape of the site favours this arrangement, as the wider arcade is also the longer and will form the better promenade, and the arcade from Church Street, being the main entrance, can better afford to be the narrower, as its position alone will render it sufficiently inviting. The following important points in the design of retail shops and arcades have been observed:—Under no circumstances should there be corner pillars or piers at the arcade entrances or at the four angles of the block, but these should either be treated as doors or windows, and the shop fronts should continue uninterruptedly from the streets into the arcades, thus almost unconsciously leading the public into them, instead of, as is unfortunately too often the case, the entrances being obstructed by corner pillars, and in some cases even blocked by staircases leading to the upper floors, and causing a sense of intrusion in the minds of persons about to enter, and deterring many from doing so, thereby militating greatly against the success of arcades. The two office entrances in Church Street give an easy ascent to the first floor, and thence the main stair is continued over the arcade entrance to the second, third and fourth floors. The three upper floors have surrounding corridors, giving access to the whole of the rooms, with a Church Street or a Lancaster Road address as desired, an additional staircase being provided in Lancaster Road, running from the basement to the top floor, and forming the principal approach to the auction-room. The passenger and luggage lifts are placed next this staircase, in close proximity to the caretaker's apartments, so that he is conveniently placed for attending upon the lifts and controlling the use of the inclined way to the basement. We have shown no strong rooms for the offices, as the floors being of fireproof construction they can be built in any position to suit the requirements of tenants. We would suggest that the offices be furnished with speaking tubes, and connected with boards fixed in the vestibules next the street, with space left for the name of each tenant. On reference to the plans of the upper floors, it will be seen that the lavatory accommodation is so placed that access can be gained to the whole of the offices without having to pass the lavatory doors; an advantage which will doubtless be fully appreciated by the tenants; we have also planned these lavatories so as to obtain cross ventilation.

The basement we have treated as a repetition of the ground floor, thus forming a kind of lower arcade, and approached by two staircases, one from Birley Street and the other from Lancaster Road, supplemented by the office staircase and passenger lift in the latter thoroughfare. We have appropriated the 6-feet space under the pavement as a surrounding footpath, but if this could be extended in width by building the retaining wall under the curbstone over, it would increase the underground footpath to about 12 feet, which would be a great improvement, and we should think there would be little difficulty in bringing this about with the Corporation, as we apprehend there can be no structural difficulties in the way.

We have adopted a contrivance which we have recently seen successfully carried out in several important blocks of shops in Wiesbaden, viz. of providing a narrow area of about 15 inches wide in front of each shop, on the street level, enabling the shop fronts to be continued down to the basement and to the sub-basement where required; by this means goods exposed in the basement shops can be seen from the street level, the angle of sight being, of course, from the line of the stall-board of the ground-floor shops. These narrow areas are protected by light iron ornamental railings about 2 feet high, so designed as to impede the view of the basement as little as possible. By this arrangement the basement shops can be let separately, and yet the goods exhibited in the windows can be seen from the street over as well as from the underground arcade, and the names of the basement shopkeepers and trade announcements can be attached to their shop fronts and be seen from the streets or the upper arcades as the case might be. To meet the wants of the ground-floor shopkeepers who do not also have a basement, two blocks of lavatories are provided, one at the Birley Street and the other at the Lancaster Road end of the lower arcade, both being divided to give accommodation for both sexes. We consider Jacson Street unsuitable for shops, so have not planned any fronting that street, and as the frontage to the arcade is much more valuable we have arranged the shops to face that way instead; for this reason we have also placed the hotel service entrance and the incline to the basement in Jacson Street. We have aimed at providing a selection of various sized shops both in the streets and arcades, which is very essential to meet the requirements of different trades and businesses, as it is a serious mistake to have too many of the same size. It is desirable to furnish the ground-floor and lower arcades with fire hydrants, having hose permanently attached. A flat asphalted roof is shown, excepting next to Jacson Street, and where towers occur. This roof can be readily utilised for future extension without interfering in any way with the occupation of the rooms under, and we have carried the two staircases and passenger and luggage lifts up for this purpose. To obtain the greatest available floor space, it will be seen that the façades to Birley Street and Lancaster Road are quite flush with the streets, and that where in Church Street and Jacson Street, on the first and second floors, portions have been slightly recessed to obtain bay windows and architectural effect, the depth and not the width of the rooms is affected, the proportion of these rooms being really improved thereby, the bay windows generally compensating for the loss of the parts recessed.

The Wine Lodge.

The ground-floor space asked for is complied with, and is divided into two sections, the smaller portion next the arcade being available for a family trade if desired. We have provided in the basement a room which will be useful for the barmen to take their meals in, &c. Lavatory accommodation is also supplied. In the sub-basement is formed a cellar, the full size of the wine lodge premises, the three floors being connected by a staircase. We have shown a lift instead of a rolling way running between Lancaster Road and the sub-basement; but to avoid this initial expense, and also the cost of maintenance, a rolling way can be formed from the basement level to the sub-basement instead, in the same way as is arranged for the hotel.

The Hotel.

We consider the best kind of hotel for this situation to be a combination of hotel and restaurant, with second-class bar in the basement, as suggested, and the restaurant can also have a frontage to the arcade by appropriating one of the shops for this purpose. The entrance to the hotel is so placed that it will be equally well seen from the Market Place, and also from Church Street, as approached from the railway stations. A billiard-room, for three tables, is placed on the first floor, as this will probably be a good source of income, worked in connection with the restaurant as well as the hotel. In addition to the coffee and commercial room, a farmers' ordinary room is also provided, which can also be used as a large stock-room. Bedrooms, kitchen department, servants' bedrooms, &c., are provided for.

The Auction Room.

We consider an auction room on the top of the building inadvisable, and have placed it on the second floor level

instead, and in close proximity to the staircase and passenger and luggage lifts from Lancaster Road. The auctioneer's and solicitor's retiring room is so situate that it can be entered from the auction room without going on to the public corridor, and has also a private approach from the main staircase.

The Caretaker.

The caretaker's apartments are provided on the upper floors, at the corner of Lancaster Road and Jackson Street, and conveniently near for attending upon the passenger and luggage lifts. In case of fire the inmates of these apartments can escape across the flat roof and down the other staircase into Church Street, or through the hotel.

Construction.

The whole of the stanchions and girders are to be of steel, encased with fire-resisting materials; the main girders supporting the walls over the shop-fronts next the streets and arcades are supported by steel stanchions carried through the basement and ground-floor storeys in one length, and encased with glazed terra-cotta externally and with concrete internally. The stanchions in the interior of the building are all encased with concrete, and are carried up to the top floor, supporting, where necessary, the cross girders carrying the concrete floors. The whole of the suspended flooring will be of breeze concrete, plastered on the underside and finished on the upper surfaces in the shops, offices, office corridors and other rooms, except lavatories, with pitch-pine herring-bone parquet flooring. The flat roof is covered with asphalt. The arcade passages on the ground-floor will be laid with buff tiles, grooved diagonally to afford a good foothold, and the lower arcades and surrounding corridor will also be paved with the same tiles, but laid on asphalt instead of concrete. The structural work is so arranged that the whole block can be built with the outside walls to the streets and arcades and floors only inserted, and including the office staircases, lifts and stack. The retaining walls in the basement will be lined with white glazed bricks with coloured brick bands. The roofs of the turrets and central towers and mansard roof over the hotel in Jackson Street will be covered with red pantiles. The office staircases from Church Street, and the staircases leading into the lower arcade from Birley Street and Lancaster Road, will have Hawkesley's patent wood-block treads in iron frames carried upon iron strings, as these stairs wear exceedingly well, are comparatively noiseless and afford a good foothold. The office staircase from Lancaster Road and also the two hotel staircases will be built with granolithic concrete, thus giving two fire-resisting staircases in the hotel and one in the main block. The two office entrances in Church Street, and the office entrance in Lancaster Road, will have white marble steps next the street, and the vestibule spaces will be laid with white tiles and ornamental borders in black, and the same treatment will also be adopted in the hotel vestibule and entrance hall. The columns and pilasters to the hotel entrance will be of red granite. The gates to close the arcades will be Bostwick's patent collapsible gates. The inclined way to the basement and the level platform to the luggage lift on the ground floor will be of granolithic concrete grooved to give foothold. The roofs over the arcades will be supported on light ornamental wrought iron principals and have patent metal glazing bars, and will be glazed with $\frac{1}{4}$ -inch clear plate glass, with narrow embossed borders and corner ornaments.

Decoration.

Externally the façades will be finished with terra-cotta to the top of the shop-front cornices, including the raised portions over the entrances to the arcades as before described, and the remainder of the first and second floors will be of good red-face bricks, with unglazed buff terra-cotta dressings. The third-floor portions of the towers over the arcade entrances, and the gable projections in Church Street and Jackson Street, together with the third and fourth floor portions of the angle turrets, will be finished with these materials. The arcaded portions of the third-floor storey, the fourth floor over the arcade entrances, and the two gables in Jackson Street and Church Street, together with the octagonal top storeys of the angle turrets, will be completely faced with unglazed buff terra-cotta. The roofs will be covered with red pantiles, and the whole of the wood-work above the shop-fronts will be painted white. The shop-fronts to the ground-floor will be of oak polished. We propose to face the interior of the arcades as follows:—The ground-floor storey will be of glazed terra-cotta; the shafts of the pilasters supporting the ornamental iron principals to be of red Ogwell marble, with pedestals of dark Ashburton marble, and the caps and bases of stone, solidly gilt; the plain wall-surfaces to the first and second storey will be of white-veined marble, and the frieze to the top cornice will be of yellow-clouded Petitor marble; the remainder of the work, including the dressings to the windows, &c., will be of tinted Faience ware.

Lighting.

We think that some general scheme of external lighting, both in the arcades and the four streets, and maintained by the

proprietor, is very desirable, as enhancing the attractiveness of the building, and we recommend for this purpose that opal globes, supported by ornamental brackets, be used in the positions indicated on the drawing, and lit by incandescent gas arc lights. These gas-lights give the same effect as electric lighting, and can be obtained of much less candle-power than electric arc lamps, and as a multiplicity of globes give a better appearance than a few lamps of great candle-power, we adopt this method in preference to electric lighting. Gas will be laid on to the hotel for cooking purposes, and also for supplementing the lighting of the staircases and corridors. The latter also applies to the office staircases and corridors.

Heating and Ventilating.

We recommend the system of heating by hot water in preference to hot air, as in a building of this description, where the partition walls are liable to be moved from time to time, alterations can be much more easily made to supply pipes to the radiators and the positions of the latter changed, than would be the case in dealing with hot-air flues, which, to be effective, must be of large capacity, and generally form part of the main structure of the building. Another serious objection to the hot-air system is that, where the floor space is most valuable, viz. the lower floors, the greater space is occupied by hot-air channels and flues. Having adopted the hot-water system, we have provided a stack, boiler and fuel stores. Provision is made for the effective draining of the premises.

PROVINCIAL MUSEUMS AND ART GALLERIES.
